## Gas Engine for Indian Office

WASHINGTON, Oct. 14—The United States Indian Office, Department of the Interior, Washington, D. C., requests bids on the following tractors and gaso-

## Contracts

line tank. Bids must be accompanied with certified checks or drafts for bond equal to 5 per cent of the total amount.

One 20-40 H.P. Gas Tractor, with following specifications:

Tractor must be equipped with four cylinder, horizontal motor, flat spoke drive wheel, and equipped to burn gasoline, kerosene and distillate oil.

OR

One 20-40 H.P. Gas Tractor, with following specifications:

Tractor must be equipped with two cylinder, vertical motor; cylinder to be 8 3/4 in. in diameter and 9 in. stroke; equipped to burn gasoline, kerosene and distillate oil. One Five-hundred gallon gasoline steel tank with truck.

Tractors which do not differ radically from the specifications given above will also be considered; give full description of what you propose to furnish, with cuts.

Bidders to plainly mark their envelopes containing their bid:

Hour, date and place of opening.  
Character of supplies to be furnished.  
Name of Indian Agency requiring the supplies.

Any supplies awarded under this bid will be delivered within .... days from receipt of order.

Please show your delivery point plainly.  
Make price f.o.b. Garrison, N. Dak. ....  
f.o.b. your plant .....  
or other points which you may name.

NO PERSON WILL BE RECEIVED AS A CONTRACTOR who is not a manufacturer of, or regular dealer in, the articles which he offers to supply on the attached advertisement and he must expressly warrant that he has employed no third person to solicit or obtain this contract in his behalf, or to cause or procure the same to be obtained upon compensation in any way contingent, in whole or in part, upon such procurement; and that he has not paid, or promised or agreed to pay, to any third person, in consideration of such procurement, or in compensation for services in connection therewith, any brokerage, commission, or percentage upon the amount receivable by him hereunder; and that he has not, in estimating the contract price demanded by him, included any sum by reason of any such brokerage, commission, or percentage; and that all moneys payable to him hereunder are free from obligation to any other person for services rendered, or supposed to have been rendered, in the procurement of this contract. He must further agree that any breach of this warrant shall constitute adequate cause for the annulment of this contract by the United States, and that the United States may retain to its own use from any sums due or to become due thereunder, an amount equal to any brokerage, commission, or percentage, so paid, or agreed to be paid.

## Engineers Corps Contracts

WASHINGTON, Oct. 10—Following is a list of contracts placed by the General Engineer Depot of the Army:

Detroit Twist Drill Co., Detroit, ratchet drills.  
Commerce Motor Car Co., Detroit; Dodge Bros., Detroit.  
White Co., Cleveland; Dunbar Mfg. Co., Chicago; American Car & Foundry Co., Berwick, Pa.; C. R. Wilson Body Co., Detroit.

and Grant Motor Car Corp., Cleveland, handbooks.  
Nash Motors Co., Kenosha, steering wheels.  
Keystone Vehicle Co., Reading, truck tops.  
Locomobile Co. of America, Bridgeport, labor on assembled machines.  
Hale & Kilburn Corp., Philadelphia, body drawings.  
Holt Mfg. Co., Peoria; Ford Motor Co., Detroit, tractors.  
Republic Stamp & Enamel Co., Canton, Ohio, cups.  
Nash Motors Co., Kenosha, nut cutters and steering knuckles.  
Four Wheel Drive Auto Co., Clintonville, chassis winch prints, radiator gaskets.  
Atwater Kent Mfg. Co., Philadelphia, machine-gun sight tracings.  
Edward G. Budd Mfg. Co., Philadelphia, steel loops and tabs.  
International Harvester Co. of New Jersey, Chicago, machine-gun wagons.

## Supplies and Accounts Contracts

WASHINGTON, Oct. 11—The following list of contracts has been placed by the Bureau of Supplies and Accounts of the Navy Department:

B. F. Goodrich Rubber Co., Akron, insulated copper wire.  
Ingersoll-Rand Co., New York, air compressors.  
J. T. Wing & Co., Detroit, gaskets.  
Fitzgerald Mfg. Co., Torrington, gaskets.  
Anderson Engine Co., Chicago, generator sets.  
U. S. Light & Heat Corp., Niagara Falls, storage batteries.  
Willard Storage Battery Co., Cleveland, storage batteries.  
Curtiss Aeroplane & Motor Corp., Buffalo, steel pins.  
Aeromarine Plant Motor Co., Keyport, floats.  
Empire Rubber & Tire Co., Trenton, hose, cotton, rubber.

## Quartermaster Contracts Let

WASHINGTON, Oct. 14—Following is a list of contracts placed by the Quartermaster Department, Board of Review:

Harley - Davidson Motor Co., Milwaukee, motorcycle parts, \$6,425.99.  
Craycroft Oil Co., New York, gasoline, \$7,050.  
Standard Oil Co. of Kentucky, Louisville, airplane gasoline, \$8,100.  
Standard Oil Co. of New Jersey, New York, gasoline and kerosene, \$9,285.  
Columbus Forge & Iron Co., Columbus, vises, \$12,806.79.  
The Columbian Hardware Co., Cleveland, vises, \$47,292.60.  
Dover Stamping & Mfg. Co., Cambridge, funnels, \$698.74.  
Standard Oil Co. of New York, Blissville, L. I., airplane gasoline, \$17,100.  
Standard Oil Co. of New York, New York, Motor gasoline, \$9,800.

## Timken Axle Making Additions

DETROIT, Oct. 14—The Timken-Detroit Axle Co. is erecting a two-story addition to its factory, also a one-story addition to its foundry.

## Bohn Foundry Expands

DETROIT, Oct. 14—Charles B. Bohn Foundry Co. is building a two-story addition to its foundry on Hart Avenue, also a one-story core room at the plant.

## Calendar

## ENGINEERING

Nov. 14-15 New York. Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

## SHOWS

Oct. 12-19 — Atlanta. Tractor demonstrations Eastern State Fair and Automotive Exhibition.  
Oct. 14-27—Dallas, Tex., Seventh Annual Texas Auto-

mobile Show. Texas State Fair.

Oct. 16-18—Ottawa, Ont., International Plowing Match, Tractor and Farm Machinery Demonstration. Experimental Farm.

Oct. 30-Nov. 4—Shreveport, La. Tractor demonstration State Fair.

Nov. 11-16—Phoenix, Ariz. Tractor demonstration, State Fair.

# AUTOMOTIVE INDUSTRIES

## The AUTOMOBILE

Look for the Name "Champion" on the Porcelain as well as on the Box

**B**UYERS of Spark Plugs for every type of motor car, motor truck (stationary, tractor, motorcycle and motor boat) engines have been educated to avoid substitution by looking for the name "Champion" on the porcelain.

The wise dealer who takes advantage of this condition does a larger volume of business.

He has a steadier trade, and as a result makes more profit. It is easier to sell Champion Spark Plugs and to sell more of them because of the public demand for them.

You protect yourself, as well as your customers, when you recommend spark plugs with the name "Champion" on the porcelain.

Champion Spark Plug Company, Toledo, Ohio  
Champion Spark Plug Co. of Canada, Limited, Windsor, Ontario

7-8 18  
Price \$1.00

## *A Guaranteed Anti-Freeze*

**WE GUARANTEE** that Johnson's Freeze-Proof has no more effect than water on the metals of the radiator or on rubber. We guarantee that when used according to directions Johnson's Freeze-Proof will give absolute protection to radiators at any temperature.

## **JOHNSON'S FREEZE-PROOF**

This is the logical anti-freeze preparation for you to stock—it is put up in compact form so will not require much space—it is the most economical because there is no freight to pay on the water—it will be the most extensively advertised non-freezing preparation on the market.

Johnson's Freeze-Proof is put up in packages containing 6½ lbs. net, packed 12 to a case. List price \$1.50 each in the U. S. A. East of the Rockies—subject to liberal discounts to the trade. All live jobbers handle it.

### **FREE OFFER!**

We will send interested dealers a regular \$1.50 package *free* and *postpaid*, this is sufficient to protect a Ford from freezing to 5° below zero. We make this liberal offer to show the trade just what our product is. Write on your business letterhead to

S. C. JOHNSON & SON, Dept. A, RACINE, WIS.

# AUTOMOTIVE INDUSTRIES AUTOMOBILE

VOL. XXXIX

NEW YORK, THURSDAY, OCTOBER 24, 1918—CHICAGO

No. 17

## Extracts from Senate Aircraft Report Testimony

Indicate Predjudice Against Automobile Industry and Disclose  
How Report Was Not a Fair Deduction from the  
Evidence—Credit Should Have Been  
Given Where It Was Due

**W**HILE waiting for the Hughes aircraft report, which is expected at almost any time, a careful perusal of the 1200 pages of evidence taken by the Senate Military Affairs subcommittee in the investigation which resulted in its report establishes more and more the conviction that the final report failed to represent the bulk of the evidence. The report was highly prejudiced against the automobile industry and as such told only one side of the story, leaving the other hidden in the report of the hearings.

Without mention of the numerous facts that testify to the loyalty, the willingness, the sacrifices and the RESULTS achieved by the automobile industry as told in the testimony, without comment in the report of the numerous delays caused by army officials and civilians in the Government employ who never were connected with the automobile interests, the comparison of the testimony with the report creates the impression that exaggeration and possibly prejudice entered into its compilation.

Thorough reading of the voluminous testimony develops several outstanding features:

a—Complete ignorance of many army officers, in aviation work, with aeronautics.

b—Appointments of army officers to important aeronautical work who were in no way familiar with their duties.

c—That the automobile industry has been most patient, active and efficient in view of the ignorance, delays, procrastination and indecision it encountered.

d—That the blame attached to the automobile industry seems to be based chiefly upon the words of a few concerns envious both of the facilities of the automobile industry and its ability to handle aircraft business.

e—That several of the Senators were more anxious to find evidences of graft than means for improving the aircraft program, although their mission was in no way to be related with the Hughes inquiry into the possible dishonesty of officials.

f—That the Liberty engine is without doubt the peer of all aviation engines.

g—That the statements made in Congress that no airplanes reached France prior to July 1 from America were untrue.

h—That the word of a single official has been accepted as the basis for wholesale denunciation of the members of the original Aircraft Board.

i—That in its anxiety to make a report severely critical much that was to be commended was left unsaid.

First to emphasize themselves to the reader because of their absence in the report are the numerous statements in the testimony that reflect great

credit on the automobile industry, and second comes the ignorance charged in the report to the automobile industry and actually merited only by the army officials and Government civilian employees who, in the main, were never connected with the automobile industry.

The Senate Committee visited the many plants throughout the country engaged in war and aircraft work. One of the first was Packard, where the committee learned of the invaluable work performed by the company in its early experiments on a Packard aviation engine and which work gave J. G. Vincent the experience that aided him in his share of the designing of the Liberty engine. They were told of the patents in the Liberty engine held by Packard "given without cost to the Government." They heard of the important services by Vincent given to the Government while he was in the pay of Packard, and how until he actually accepted a commission in the army, Packard donated his services to the nation.

### Ford Ahead of Schedule

At Ford's the committee learned that in addition to the vast war work the company is doing other than in aviation, it holds a contract for hundreds of thousands of Liberty engine cylinder forgings, and that the company was not only up to the minute on its contract, but could complete it faster than the Government could consume the product. They heard also that the company installed new machinery for the work.

The General Motors Corp., the committee was told, built a plant especially for the aviation work and at the time of the investigation was up to 100 per cent production on many parts of the Liberty engine and close to that figure on the others. The committee was told, and no mention was made in the report, of the critical hindrance to production created by army officers who visited the plant and enticed the important workers away by telling them they could avoid trench service if they enlisted for repairshop work abroad.

The committee was told, and made no mention in the report, of the keen competition for workers among various concerns in the country and the need for Government control of the labor situation.

No mention was made in the report about the fact that the Cadillac delay in Liberty engine production was due to the fact that all its tool-room capacity had already been given over to other Government war work. No mention was made that Cadillac was at the same time turning out 3,000,000 airplane parts for the Fisher Body Co., besides thousands of micrometer gages for the Liberty truck. And no mention is in the report of the "splendid co-operation between the various automobile companies" engaged in Liberty engine production in the exchanging of surplus parts, thus increasing the outputs.

At the Lincoln plant the committee learned and never mentioned that Lincoln was started as a patriotic venture with the outbreak of the war because the founders believed manufacturers should be ready to aid the Government. They learned that the

Lelands invested over \$2,000,000 in the establishment of the plant, which cost was not in any way figured in when the cost-plus contracts were made. Also, they heard how the Lincoln company sent representatives to all sections of the country, visiting 83 factories to secure the tool-makers necessary for the Liberty engine work. And the report did not tell how the Government itself delayed the company by its ignorance of whether it would use an eight or twelve-cylinder engine. And they did not report that the company shipped 236 engines complete and perfect by June 1, and was quickly nearing schedule production.

No mention was made of how the Fisher Body Co. lost 2 months in production and was forced to cut down its organization from 800 men to 200 men because following receipt of a contract only 5 per cent of the drawings arrived from the Government and were followed by changes ordered almost daily, or how W. C. Potter, who lately has been Acting Chief of Aircraft Production, testified that the Fisher Body Co. was "doing wonderful," or how Captain D'Annunzio of the Italian Mission told that the Fisher Body Co. "had a very good plant."

The committee heard from C. F. Kettering, a recognized engineer of automobile parts and a member of the Dayton-Wright Airplane Co., how his every suggestion was turned down by army men with the statement that "it would not work."

### Board of Competition

And at this part of the testimony Senator Chamberlain himself said that, because of the testimony, the situation could be compared to that of the Ordnance Department of a year previous, when "its proper purpose was to furnish the American Army with the best practical equipment that would be up to date, but instead of performing that function they had long ago resolved themselves into a board of competition with the inventive genius of the world."

And in the report is no mention of the statement by Senator New of Indiana, who testified that at Nordyke & Marmon "I found the company very greatly embarrassed and their work seriously retarded through their inability to receive deliveries of tools at an early date, but this embarrassment has been overcome and the plant is now ready to begin deliveries at an early date." He also told that Walter Marmon stated that one of the greatest difficulties was caused by interference with the work by the Government itself, particularly the Ordnance Department, which stopped workmen making tools and diverted their activities.

It may be that the report intended in its criticism of the automobile industry to blame only those members of the industry who were officially connected with the Government in its aircraft program. This inference may seem warranted by the severe denunciation given later in the report to those men. But it is not warranted by the testimony which shows that the actual aircraft program and actual production were the direct work of the Signal Corps under General George O. Squires and that this section in the reorganization came in under the name of the

Bureau of Aircraft Production, the body that is actually responsible for the placing of contracts and the inspection and production. In the original body under General Squires this was known as the Equipment Division and it included within its reorganization practically every man who had served under the General. John D. Ryan, testifying that this was the body that actually made contracts and purchases, and which was, therefore, the one to be held responsible, told that it included W. C. Potter, formerly with the Guggenheims in mining and metallurgy; Kellog, Potter's assistant and a metal manufacturer; Colonel Mixter, formerly with the John Deere Plow Co., and in charge of production; Major Wold, formerly a certified accountant and in charge of finances; Major Downey, a Regular Army officer, in charge of disbursements. All of these men, with the exception of Colonel Mixter, who was replaced by A. A. Landon of the American Radiator Co., are still holding the same positions. None were automobile men.

#### Where the Denunciation Originated

The denunciation of the automobile interests seems, after perusal of the report, to be founded upon the testimony of H. B. Mingle, president of the Standard Aircraft Corp., Elizabeth, N. J., who laid stress on the fact that the automobile industry was considerably interested in this aircraft production and was trying to monopolize it. It may also have been occasioned by the possible misunderstanding of the committee that such concerns as the Excelsior Mfg. Co., making an inferior engine in the "Lawrance motor," were automobile concerns. The Standard Aircraft Corp., which complained of the automobile industry interest in aircraft, is a company financed by Mitsui & Co., Japanese bankers, who hold the \$2,000,000 preferred stock of the company, and who, according to the testimony, were also the paymasters for the German secret service prior to the war. This concern, now engaged in making airplanes for Japan, was criticised as inefficient by Major C. B. Rose, who told that the company was trying to make De Havillands, H.I I-L navy boats, J.R. I-B training planes, flying boats for Japan, Handley-Page planes and M. defense planes at one time. This concern is the one, also, that caused Captain D'Annunzio the impression that Capronis could be built there quickly in quantity, by its promises. The president of this company, according to the testimony, was a lawyer prior to the war and without manufacturing experience, whose salary of \$62,000 as president of the company is figured into the cost-plus contract the company holds with the Government.

Further, the Senate report does not tell in any detail of the ignorant army officers placed in important positions and who delayed the air program. It does not tell of the testimony of W. F. Parish, chief of the oil and lubrication section, Bureau of Aircraft Production, who told that engineers at the various fields were men who had been given a hurried 3-months course in engineering at the Massachusetts Institute of Technology and other institutions, men who prior to holding these important

places were bill clerks in freight offices, grocery clerks, wooden box makers, bond salesmen and others who had been in occupations in no way connected with engineering.

There was also criticism of the automobile men by Col. T. H. Bane, who complained that the automobile engineers assumed they could make airplanes without reference to men who are practical fliers and aeronautical engineers. He did not tell which aeronautical engineers in this country had been ignored. He probably referred to himself and other fliers in his statement, which brings to mind the possible analogy of asking a chauffeur to collaborate with an automobile engineer in the design of a machine.

#### Other Reasons for Delay

Other reasons for the delay in the program revealed in the testimony and in some instances touched upon by the report include the difficulties encountered by the Curtiss Aeroplane & Motor Corp. where a contract was received from the Signal Corps for Spad airplanes on Sept. 19, 1917, following which the company started tooling up and got in such shape they could have completed the order, according to the testimony, by February, 1918. On Oct. 2, 1917, the company received a telegram ordering modifications in the plane to adapt it to the Marlin machine gun, which caused delay. On Oct. 10, when 1500 drawings had been completed, new orders called for the use of the Vickers gun instead of the Marlin and this meant new drawings. On Oct. 22, 1875 drawings were ready and the company awaited the list of materials as used by France in the Spad. These were secured on Oct. 27, when the company wired for instructions to go ahead with the contract. Washington did not reply, and finally, on Nov. 7, orders were received to withhold all work on Spads, and no work has since been done on this contract. On Sept 15, 1917, Curtiss also received an order for 500 Caproni planes, on which it has never been able to get the "go ahead" orders. And according to George H. Mueller, chief engineer of the company, when they finally received an order for Bristol airplanes they were so troubled with changes ordered by the Government (which amounted to more than 1200 in March, 1918, alone) that it was almost impossible to turn them out.

That the Senate Committee was also out to learn about possible personal interest in the placing of contracts is revealed by the frequent question into the value of the Delco ignition system in which Col. E. A. Deeds was interested. Senator Frelinghuysen inquired of George H. Mueller of the Curtiss Corp. if the Delco ignition system could be improved upon. Mueller replied that he did not believe so. Senator Chamberlain asked Charles M. Manly, Curtiss engineer, what his opinion of the Delco system was, and was told that he approved of it. Senator Reed, who displayed the keenest interest in this matter, asked O. E. Hunt of the Packard Motor Car Co. what ignition he used on the Packard airplane engine and was told the Delco. He asked Mr. Hunt if he regarded the Delco as the best ignition system

(Continued on page 739)

# Tractor Activities in the Twin Cities

Tractors in All Sizes and in Many Types Being Built in Minneapolis—Number of Manufacturers in the City Large, But Big Producers Are Few—What the Different Firms Are Doing

By P. M. Heldt\*

**M**INNEAPOLIS has been a fertile field for tractor development for many years past, and the lists of tractor makers at various times have shown more than a score of manufacturers located there. The neighboring city of St. Paul has shared, to a small extent, in this development. A few of the manufacturers on the Minneapolis list have got into production on a large scale and turn out tractors by the thousands annually; several others operate on a more modest schedule and of these some have their machines manufactured for them on contract. Of the concerns listed with addresses in downtown office buildings, the majority seem to have gone out of business. Some still have a place where they receive their mail, while others have vanished entirely. Minneapolis to-day has more individual tractor factories than any other city in the country, though she may not be producing the largest number of tractors.

The Minneapolis Steel & Machinery Co. is a very large concern, and although tractor manufacture is only a small part of its business it turns out a couple of thousand machines a year. The firm manufactures four different models, with ratings ranging from 16-30 to 60-90 hp. Of course, the 16-30 is the leading model; that is, the one produced in the largest numbers. Although the firm is now 80-85 per cent on war work, it is continuing to turn out tractors in large numbers and is doing development work at the same time.

## All E-B Models Burn Kerosene

Emerson-Brantingham Implement Co. also count among the largest tractor concerns in the country. They operate several tractor plants in different parts of the country, the Minneapolis plant turning out tractors of the smaller sizes. The medium-sized machines (20-35) are manufactured at Waynesboro, Pa., and the large ones (40-65) in Indiana. The present output of the Minneapolis plant is about 25 tractors per day. All of the E-B models are burning kerosene and distillate, but development work is being done on the heavy fuels problem by the company's engineers.

The "Big Bull," which has long been a prominent product on the tractor market, is being manufactured for the Bull Tractor Co. The engines for the Bull

tractor are being manufactured by the Toro Motor Co., which is related to the Bull Tractor Co. through stock ownership, and the frames and other structural parts have been manufactured by the Minneapolis Steel & Machinery Co.

The Bull is a two-cylinder tractor with a 12-24-hp. rating. It has a frame of 9-lb. channel steel which is hot riveted. The engine is of the opposed type, with L-head cylinders of 5½-in. bore and 7-in. stroke. It is provided with a governor and its speed is controlled at 750 r.p.m. Lubrication is by circulating splash and ignition by magneto with an impulse starter. Kerosene is the fuel burned and a supply of 18½ gal. can be carried in the fuel tank, besides 3½ gal. of gasoline used in starting. The weight of the tractor is 4870 lb., and it is geared to operate at a plowing speed of 2.4 m.p.h. The drive is direct through spur gear and roller pinion to the bull wheel. A contracting type of clutch is used, which is lined with Thermoid asbestos fabric and acts on a flange cast on the flywheel. The belt pulley has a diameter of 12 in. and a face of 6½ in.

## Is of the Three-Wheel Type

The Bull tractor is of the three-wheel type, having a large drive wheel running in the furrow, a small land wheel which also has power applied to it, and a single front steering wheel. The drive wheel is 60 in. in diameter by 14-in. face; the land wheel 40 in. in diameter by 8-in. face, and the front wheel 30 in. in diameter by 6-in. face. The frame extends around the main drive wheel. Hyatt roller bearings are used.

Recently the Bull Tractor Co. has brought out a lawn roller which is equipped with the same power plant as the Bull tractor. It has a single central front roller and two rear rollers, the three overlapping so that a space equal to the width over the two rear rollers is compacted at each passage of the machine. The rollers are made of boiler steel and are designed to be ballasted with water. When the machine is light it weighs about 5700 lb. and when filled with water the weight is about 7700 lb. The drive is from the engine crankshaft through the clutch and a spur-gear reduction to the jackshaft and thence by chains to sprocket wheels secured to the outer ends of the two rear rollers. There is thus a double chain drive to the two rollers which are mounted rigidly on the axle, and in order that each chain may take an equal amount of driving effort a

\*P. M. Heldt has been making an extensive investigation of farm tractor manufacturing conditions throughout the Middle West.

frictional equalizing device is incorporated in the jackshaft which slips if one of the chains transmits all of the power, but holds if the power is equally divided between the two chains. Steering is effected in the same way as on the Bull tractor, viz., through a worm and worm-gear sector, and the backward thrust on the forward roller is taken through a horizontal yoke spanning it on a small thrust roller mounted on the frame.

This roller is intended for use on golf links and parks, on large estates, etc., and it is believed that it will also prove useful as a road roller. The first machine was built to the order of the Minneapolis Golf Club, of which the officials of the Bull Tractor Co. are members.

The Nilson Tractor Co. began operations in 1914 and has turned out to date a little over 1000 machines.

It is now producing two models, known as the Nilson Senior and the Nilson Junior respectively. Both are equipped with Waukesha four-cylinder engines, the Senior having the  $4\frac{3}{4} \times 6\frac{3}{4}$  size and the Junior the  $4\frac{1}{4} \times 5\frac{3}{4}$ -in. size. One of the features of the Nilson tractor is the triple drive wheel, and another the patented lever hitch, by which some of the weight normally carried on the front wheel is transferred to the rear wheels when the tractor is pulling a load, so as to increase the traction which it is possible to obtain without slippage of the driving wheels. Either gasoline or kerosene equipment is furnished. The fuel capacity is 28 gal. on the Senior and 18 gal. on the Junior. Ignition is by K-W high-tension magneto with impulse starter. Both engines are governor-controlled, the governor speed being 800 r.p.m. in the Senior and 1000 r.p.m. in the Junior.

The transmission has a three-point support and gives two forward speeds and one reverse. Hyatt roller bearings are used throughout. Three different gear reductions can be obtained by using sprocket pinions of 10, 11 and 12 teeth respectively. With an 11-tooth pinion the speed range is  $2\frac{1}{2}$  to 5 m.p.h. for both

*This power roller has the same engine as the Bull tractor. It is designed for use on golf courses, in parks and on large estates, and may be used also for road rolling*

models. There is a double-chain drive to sprockets between the outer and the central driving wheels. Shock-absorbing and equalizing devices are embodied in the rear-drive sprockets. The frame of the Senior is made of 6-in. channel steel and that of the Junior of 5-in. Both frames are mounted on half-elliptic springs with adjustment and equalizing features. The Senior complete with its side wheels weighs about 6200 lb., while the weight of the Junior is 5000 lb. Owing to the use of the three driving wheels the weight per unit of ground contact area is low and the tractor should be able to operate on very soft ground.

The Gray Tractor Co. continue to manufacture their drum type of tractor, for which they have had a very good sale. Gasoline equipment is furnished regularly with this tractor, but where the customer desires to use kerosene a Bennett carburetor is fitted. During the past year quite a number of Gray tractors have been exported, the majority of them to France and Switzerland. Some also were sold to the U. S. Aircraft Production Board and the Engineers Department, undoubtedly for use in construction work.

A tractor of a rather unusual type is manufactured by the Beeman Garden Tractor Co. It is designed more particularly for use by truck farmers, and is essentially a one-horse motor cultivator and an all-purpose portable power plant. The machine is claimed to operate successfully any implement which is ordinarily drawn by one horse, and as a portable engine it delivers 4 hp. at the belt. Being a small outfit and therefore appealing particularly to farmers working small places, it is no wonder that the machine has a large sale in the East, and the writer was told that the New York agent alone placed an order for a thousand of these machines for the coming year.

The C. O. D. Tractor Co., which maintains a salesroom in Minneapolis, sells about 200 tractors a year. The machine, which is of three-plow size, is manufactured for them in St. Paul. It is equipped with a two-cylinder opposed engine of  $6\frac{1}{2}$ -in. bore by 7-in. stroke, and is characterized by unusually large rear driving wheels (70 in.). A leather-faced cone clutch is used, and the transmission to the driving wheels is by two pairs of spur pinions and wheels. The frame is built up of 6-in.  $10\frac{1}{2}$ -lb. channel steel and is strongly braced. The driving axle is 3 in. in diameter and made of cold-

*Beeman garden tractor doing field work. This machine is much used in truck farming*

*Right side view of Bull lawn roller, which is designed to be operated with water ballast*

rolled steel. It is mounted in white metal bearings. As stated, the reduction from the engine crankshaft to the rear axle is obtained in two steps, the first being through a set of spur gears with a face of  $2\frac{1}{2}$  in., and the second through the bull gear and pinion of 4-in. width of face. The countershaft gear has a diameter of 36 in. and the bull gear of 48 in., these very large gears permitting of obtaining the large reduction required on account of the high driving wheels in two steps. The radiator is mounted so its plane is parallel to the longitudinal axis of the tractor and is driven from the engine crankshaft through two belts and a pair of intermediate pulleys. The entire front axle swings in steering, and is operated through a worm and worm-gear sector. The weight of the C. O. D. tractor is approximately 6400 lb. It is rated at 13 hp. at the drawbar and 25 hp. at the belt.

The Short Turn Tractor Co., which was formerly located in the Globe Building, Minneapolis, has secured a plant in Bemidji in the northern part of the state.

A plant that is devoted almost exclusively to tractor work is that of the Imperial Machine Co., 1611 Central Avenue, Minneapolis. The Imperial company manufactures for its own account a heavy tractor known as the Imperial 40. This machine is built on order only and five of them were turned out during the past year.

It is equipped with a four-cylinder  $7\frac{1}{2} \times 9$ -in. engine which is said to develop 70 hp. on the belt and 40 hp. on the drawbar at an engine speed of 400 r.p.m. While the engine is of the four-cylinder type, the cylinders are arranged horizontally in two opposite sets. The radiator is of the company's own design and construction, and consists of vertical brass tubes extending between upper and lower tanks. It is mounted with its plane parallel to the longitudinal axis of the tractor. The total capacity of the cooling system is 40 gal. An internal expanding sector type of clutch is fitted. The transmission gives two forward speeds, viz.,  $1\frac{1}{2}$  and  $2\frac{1}{4}$  m.p.h., and one reverse speed equal to the low forward speed. The regular drive wheels are 8 ft. in diameter with 24-in. face, but if desired, extra wide drive wheels with 36-in. face can be furnished. The forward wheels are

5 ft. in diameter with 15-in. face. The whole front axle is pivoted at its center on a vertical axis around which it turns in steering. An all-spur drive is used, with bull wheels on the two rear driving wheels. Gasoline is used as fuel and a supply of 70 gal. can be carried. The tractor has a shipping weight of 21,000 lb. and should be capable of hauling at least ten bottoms.

Located at the same address as the Imperial Machine Co. is the Stinson Tractor Co. The latter concern during the past year turned out about 100 of its 18-36 Stinson tractors, which so far have been manufactured on order. The Stinson company has, however, purchased the equipment of a machine shop that has been doing

some of its work in the past and will probably, before long, manufacture its own tractor.

The Stinson is an assembled machine employing a four-cylinder Beaver engine of  $4\frac{1}{4}$ -in. bore by 6-in. stroke. It is of the three-wheeled type, having a single forward steering wheel which runs in the furrow when plowing. Most of the weight is supported on a cast frame secured to the rear axle. This frame connects to the goose neck of the steering wheel by a pair of steel tubes. A dust separator of the company's own design is fitted, in which the air for the engine is drawn through water. Ignition is by Dixie high-tension magneto with impulse starter, and the carburetor is a Kingston. Transmission is by a spur pinion and intermediate gear and thence by a bull pinion and bull gear, the latter of  $4\frac{1}{2}$ -in. face. The intermediate gear and its pinion are cut gears and have a 3-in. face. Two speeds are obtained, viz., 2 and  $3\frac{1}{2}$  m.p.h.

The driving wheels are 60 in. in diameter by 12-in. face and are fitted with 18-in. angle-iron lugs. The front wheel is 36 in. in diameter by 8-in. width of face. Kerosene is used for fuel, and a supply of 22 gal. can be carried in the fuel tank, in addition to 3 gal. of gasoline for starting. The capacity of the radiator is 10 gal. The foot brake operates on the intermediate gear shaft

*The Wilson Senior, showing its characteristic features, such as three rear drive wheels and lever hitch*

and is of the band type with Raybestos lining. The weight of the tractor ready for shipping is 6350 lb. This is a four-plow tractor.

Formerly the Simplex Tractor Company had an office in the plant of the Imperial Machine Co. and during 1916 it had built 50 tractors on order by the latter concern. No more Simplex tractors have been made, however, and the writer was told that the manager of the Simplex company, G. A. Tudhope, had gone East.

The Common Sense Gas Tractor Co. manufactures a three-wheeled tractor having automobile lines. It has an eight-cylinder Herschell-Spillman engine mounted on the frame in front under an automobile type bonnet, and the driver's seat is arranged back of the engine space and ahead of the single rear wheel. Last year's production of this tractor was given as 50 and next year's schedule had not been fully decided yet at the time of the writer's call. The drive from the engine crankshaft is through an expanding clutch and a pair of bevel gears to a countershaft carrying the pinions for the two forward speeds. These are adapted to mesh with spur gears on another countershaft, whence the power is carried through two roller chains to the single rear wheel. Contrary to conventional practice, the gears of the transmission are arranged slidably, and in order that the load may be equally divided between the two driving chains the driving pinions are clamped on the shaft between friction disks and will yield if one of the chains takes the whole load or nearly the whole load. Hyatt roller bearings are used in the transmission, with ball bearings for end thrust.

An advantage is claimed for having the driver's seat close to the motor, as it will enable the driver to more readily detect and locate faults in the engine. The two forward speeds are  $2\frac{1}{2}$  and  $3\frac{1}{2}$  m.p.h. at a motor speed of 1200 r.p.m., for which the governor is set. The belt pulley, which is 20 in. in diameter by 3-in. face, is mounted on the lower transmission shaft and is used with the gears in neutral. It turns at one-third the speed of the crankshaft. The rear axle is a live axle revolving with the large driving drum, and is  $3\frac{3}{16}$  in. in diameter. This axle is mounted in babbitt bearings on the frame.

### Has Two Drawbars

The front wheels are 36 in. in diameter with 6-in. face and the main drive wheel is 62 in. in diameter and has a 24-in. face. This wheel is made of 7/16-in. boiler steel, welded and equipped with 54 spade lugs measuring  $4\frac{1}{2} \times 2\frac{3}{4}$  in. of the base by 5 in. in height. There are two drawbars, one directly under and about 6 in. below the frame and the other at the top of the frame. Each is made of  $3 \times 3\frac{1}{2} \times \frac{1}{2}$ -in. angle iron and has  $\frac{7}{8}$ -in. holes drilled along it so that implements can be attached to it. The Common Sense tractor has a wheel-base of 9 ft. and weighs 6000 lb.

One of the oldest firms in the tractor industry is the Kinnard & Sons Mfg. Co., which has been manufacturing farm tractors continuously since 1898. The firm was formerly known as the Kinnard & Haines Mfg. Co., but was reorganized under the new name a little over a year ago. The Flour City tractor, as the product of this company is known, is made in five sizes, rated respectively at 40-70, 30-50, 20-35, 15-25 and 12-20 hp. During the coming year a new model will replace the last two in the list, combining some of the features of both of them. The Kinnard firm manufactures practically all of the parts going into its tractors in its own plant. The smallest model of the line, the Flour City Junior, has a two-cylinder vertical engine, while all the

others are equipped with four-cylinder engines. Kerosene is used for fuel in all models.

St. Paul at the present time boasts only of a single tractor plant, that of the Belt-Rail Tractor Co., which firm is as yet comparatively new in the industry. The Belt-Rail tractor is of the creeper type, having a single wide creeper tread at the rear and two steering wheels at the front. A peculiarity of the creeper construction is that the teeth of the driving wheel engage with extensions of the creeper shoe or link, instead of with the pins of the creeper tread, as is more usually the case. A full technical description of this tractor, which has been manufactured in moderate numbers so far, appeared in a recent issue of AUTOMOTIVE INDUSTRIES.

Another tractor formerly made at St. Paul was that of the Hackney Mfg. Co. This concern began the manufacture of tractors in 1908 and has turned out about 600 up to date. Early this year it had a fire in its plant, which proved quite a setback, and in view of the situation in the materials and labor markets, the company decided to suspend the manufacture of tractors for the duration of the war. This decision was reached after two new models had been completed, one a 3000-lb. tractor with high ground clearance for cultivating and similar light work, and the other an 8000-lb. standard tractor. While not manufacturing any tractors for the present, the company maintains a stock of repair parts for tractors it has put out in the past.

Another one of the pioneers in the tractor industry of the Twin Cities was the Andrews Tractor Co., which formerly put out a tractor having a number of unconventional features. It was a three-wheeled affair with a single drum-type driving wheel in the rear. The machine had a 2 cycle, air-cooled motor, friction transmission, and three wheels. All of these features have been more or less unpopular of late, and owing to the distrust of the farmer of the air-cooling and friction drive principles, Mr. Andrews decided to abandon the manufacture of the machine. He is now engaged in the manufacture of tractor conversion units for Fords and other passenger cars. One of the conversion units for Fords is known as the American Ford-A-Tractor and the other as the Handy Hank. A conversion unit is also being made at the Andrews plant for larger passenger cars than the Ford, to the order of the Big Auto Tractor Co. Converters of this kind have been applied to the Winton, Glide, Buick, Packard, White, Hudson, Locomobile, Stearns, Case and other large cars, and convert these into four-plow tractors. Another conversion unit is made for motor trucks and permits these latter to be used for both trucking and tractor purposes by the simple interchange of the front rims and rear wheels. To transform the Twin T from a truck to a tractor the demountable rim tires of the front wheels are replaced with tractor tires, and the rubber-tired rear wheels are replaced with steel tractor wheels. It is claimed that the change can be made in less than half an hour.

AN extensive motor bus service is to be started in Tokyo by Dec. 1 for both freight and passenger traffic. Eventually the service will be maintained by 180 passenger cars, each carrying 16 persons, and by 50 motor trucks for freight. The passenger fare will be  $4\frac{1}{2}$  cents with an extra half cent for transfers if needed. The route of the motor bus system will follow the principal street car lines of the capital of Japan. The company announces it is planning to buy the initial fleet of motor buses from American manufacturers by Oct. 1. Later the company will build its own buses at Tokio. The building of automobile bodies is carried on quite successfully in Japan, although the importation of practically all chassis used has been compulsory.

# Some Recent Types of

**Spad Single-Seater Tractor Scout**

Engine .....	200 hp. Hispano-Suiza	Climb to 10,000 ft. ....	12 min. 30 sec.
Armament .....	1 Vickers gun	Span .....	25 ft. 8 in.

Approximate date of manufacture of first  
machine ..... September, 1914

This is the principal training machine now used in the British Royal Air Force. All machines are fitted with dual control.

# South Africa Has Gasoline Shortage

Price Is \$1.30 Per Gallon—Taxis Idle—Fuel to Be Rationed—Willard Station  
Opened—Body Building Begun—Starts Rubber Industry

By M. Edward

**J**OHANNESBURG, SOUTH AFRICA, Aug. 14—Johannesburg and South Africa in general were just getting accustomed to a shortage of automobiles caused by a reduction in shipping facilities when a new scare occurred, namely, that of a serious gasoline shortage. This is the second one in 9 months. As a result, the government has decided upon the rationing of gasoline and has organized a committee for this work. The necessity for rationing has existed for some time. The price of gasoline to-day is \$1.30 per imperial gallon, if one is fortunate enough to obtain it at all. New supplies are not expected before the end of October, and it is now only the beginning of August. At present there are a few sailing vessels on the way with cargoes of gasoline, so that soon the stores of oil companies which are now empty will be fairly well stocked. At present 50 per cent of the taxi drivers in Johannesburg are out of work because of a lack of gasoline. It is expected that the use of taxis will soon be limited to essential requirements, and that the public will not tolerate their use for such purposes as attending races and joy riding.

Garages are reserving the gasoline for their customers, and in some cases only supplying those who they know need it for business. The joy-rider is looked upon sternly these days. There is also a paraffin famine in full swing, a case of 8 gal. being unobtainable at a time,

and charged for at, in some instances, \$5 a tin, which is real profiteering, as the Government has fixed the price at \$2.50. But as is often the way when prices in commodities are fixed, things become almost unobtainable, and anyway it is not much good trying to run one's car on paraffin that is almost the same price as gasoline.

This shortage has only just set in and falling off of motor traffic in South African cities is not yet noticeable. Most people have a little gas stored away somewhere in preparation for the famine that has threatened so often.

The motorcycle has always been a rival of the automobile in South Africa, owing to the high price of the latter. Although a motorcycle and sidecar of the Harley-Davidson and the Indian type costs around \$750, this price is low compared with even that of the Ford at much over \$1000.

Now that gasoline is scarce and high priced, motorcycles are still more favored by people who want a fast means of getting about for business—although with the few new cars that have come into the Union in the last few months it is impossible to gage the real effect of motorcycles on car sales, for nearly all new cars up to date are sold, and in most instances further shipments are being awaited to fill actual orders. Still the motorcycle will be a rival to the automobile so long as

*A group of trailers contracted for and designed by the General Garage and built by Wevell Bros. for the South African Railroads. The building is the new home of the South African General Electric Co.*

*Motor debris in an East African camp lately occupied by the Germans and used for repair purposes*

*Mixed convoy in German East Africa. Some roads are excellent*

*Roodepoort Municipality has a real fire engine. The body was built by Wevell Bros., Johannesburg*

*The fire engine is convertible into an ambulance and is an excellent example of South African body building*

*Seven electric vehicles used by the Johannesburg general post office*

*An example of local body building; an ambulance built on a Reo Six chassis*

*One of the small body building firms which have started in many of the big towns in South Africa*

*A Ford camp in late German East Africa*

*British transport trucks burned by the enemy*

the present high petrol and car prices continue. It is surprising the number of motorcycles to be seen all over South Africa and other British colonies, and one of the first things that a visitor to the United States of America notices is the almost complete absence of motorcycles in the largest cities.

There is not much difficulty in obtaining spares, most agents having fairly large stocks on hand. Tires are also obtainable in most sizes, but, as is only natural, are steadily increasing in price. An 8 x 5 x 105 tire now costs about \$50, as against \$40 six months ago.

All the 1918 model cars have been seen now. The 1918 Hupp being the latest arrival and having most changed in construction, it is perhaps just as well to mention it from a South African point of view first. When it arrived it was so unlike what we think of as a Hupp that it took some time to get owners' opinions. Well, it is going to be just as popular as ever. The fact of less weight with more power is a selling feature in the country districts, where there had been a feeling that Hupps were going a bit to the heavy side. The manufacturers have been wise in still keeping the magneto, a Hupp feature for this country.

Studebaker cars are gaining in popularity in the country districts—a result of good advertising and the goods being up to it. The Johannesburg Motor Mart, the agents, have had a stiff fight to bring this car back

to its former popularity. It takes a long time to overcome any prejudice in the mind of the farmer.

The Chevrolet agency has not been placed yet, and none of the 1918 Colonial models has come to South Africa. A few 1917 models that arrived after the agency went in have been sold recently, mostly in Cape Town. Everybody appears to have forgotten about the much-advertised and over-boomed Chevrolet, whose failure was due more to this overbooming than car defects, the chief of which appeared to be too much power. South Africa will find out the best and worst in any automobile made.

Another car that has proved itself useless for country work is the Scripps-Booth. As can be well imagined, its daintiness does not lend itself to the hard work to be found on any South African road; but Wevell Bros., who run this car, do not advertise it for country use, and it is fairly popular in the towns, especially as a lady's car.

The Reo has won the respect of all. Saker's Garage, agents, has placed more Reos in public service works than three other makes, excepting electric vehicles. Reos are now to be seen as fire engines and ambulances. The Roodepoort Municipality, a town of 8000 inhabitants, 14 miles from Johannesburg, was the first to try out a fire engine built on a Reo six chassis. This month two Reo ambulances went into the Johannesburg municipal serv-

ice. Reos are snapped up by the municipalities almost as fast as they arrive. The 1918 Reo is a little heavy to appeal to the farmer.

One thing this great war has done. It has made South Africa more self-reliant. Spares and bodies that were deemed impossible to manufacture four years ago are now being made by several firms manufacturing exclusively.

The South African Rubber Mfg. Co. is turning out such things as rubber motor mats and retreading and vulcanizing tires. They might make tires soon, but this can in no way affect the importation of tires for a long while.

A Willard battery service station has been opened in Johannesburg. This is the first service station of its kind in South Africa, and it fills a want. All car owners

who use batteries are requested to employ the service.

The word "service" is getting to mean something here now. Nothing succeeds like success, and success attending the efforts of those trying out service ideas has led to general betterment of the South African automobile business.

From a sales point of view things have not altered much yet, although most garagemen are getting anxious. Cars have been coming forward from the United States of America lately, spasmodically, it is true, but in fair quantities. It seems hard that just when salesmen are patting themselves on the back about having a few cars to sell there should be confronting them a scarcity of gasoline to run them on. It is fine to have cars that are supposed to have been wandering about the ocean for the last few months come to hand at last.

## Automotive Activities at the Front

*German tank of the large type which was put out of action by a direct hit from an American 75-mm. gun during a counterattack by the first division of artillery somewhere in France*

*This is a mobile laundry where much of the washing for soldiers is done. A number of these are in use in the various army divisions in France*

# Collective Bargaining Outside or Inside?

## The Manufacturer Must Decide Whether He Will Bargain Collectively with a Labor Union or Collectively with an Employees' Organization

By Harry Tipper

**F**ROM time immemorial the general method of payment for labor has been based upon a time consideration. Centuries have elapsed since the laborer's pay was a penny a day, but the daily or hourly measure as a basis for payment persists in most lines of work and involves most labor.

It is probable that with most classes of work the system will prevail which has been found most acceptable for the long period of history and for so large a section of the working public. This much is generally understood, but it is not usually appreciated in industry that for most of that same period of centuries the rate of wages and the conditions of labor have been the subject of collective action.

During most of that time the amount of wages for labor, the regulation of apprentices and other matters were the result of national legislation in Great Britain. In fact, the laws governing these matters were still on the statute books at the time of the formation of the United States, although they had by that time fallen into general disuse.

Three things came definitely out of the history of labor legislation in Great Britain, during those long centuries of growth.

### Three Points from Labor History

- 1—The universal character of the time system of payment.
- 2—The control of wages and conditions of employment by legislation.
- 3—The strong character of the law against combinations of workers for the purpose of increasing wages or changing the conditions of employment.

It is evident from these examinations that the choice of work and the liberty of private contract were practically unknown before the beginnings of the industrial revolution in that country.

It was not till 1824 that the right of private contract between employer and employee was recognized and it was recognized then only to bring in such chaotic conditions as resulted in the formation of labor unions and an era of great disturbance in industrial life, with the general adoption by the workers of the old principle of collective decision upon wages, but operated through the new machinery of collective bargaining.

As far as it is necessary to go back in the history of the matter, collective action on wages has been the normal method of settling the matter—that is to say, the collective method has obtained through 80 per cent of the time for a majority of the workers.

During the last part of the craftsman period in the last half of the eighteenth century the legislation determining wages had fallen into disuse, so that in this period of small workshops and intimate contact between master and man the private contract system had actually grown up in the form of an individual agreement between the master craftsman and his employee.

The employer of these artisans was himself a workman, who, by his skill and capacity, had accumulated around him a number of others for the privilege of studying with him, or because of the power and comparative wealth incident upon skilful operation.

### Employees Treated as Individuals

The skill of the worker was his own. It belonged to the master only as he treated the workman individually in accordance with his individual requirements.

The tools with which the workman produced a result in the days of hand labor were such that they depended for their usefulness entirely upon his skill, the unskilled being unable to do anything with them.

It was necessary, therefore, for the employer to treat each of his employees as an individual. The value of all the work was his own, the skill of his hands in executing and the skill of his brain in planning he could carry away with his bag of tools.

The industrial revolution changed the whole aspect of the matter. The whole craftsman life was based on his individual value as a worker and his individual character as a citizen. In everything which he did he stood out and measured himself and was measured by others as an individual. The table or chair, the saddle or shoe, the piece of cloth were his work and their value bespoke their quality.

He could express his individual ideals in his individual work and in that way at once satisfy his ambition for accomplishment and acquire his standing among his neighbors.

When steam power made it possible to enlarge the little shop, to multiply the speed, size and capacity of the tools and to transfer a large part of the skill from the man to the machine, there was a change from individual to collective work, a change from constructor to operator, from workmanship to tending a machine, from a broad knowledge of the skill of a trade to the narrow requirements of a specialized operation.

The individual value to the employer was lost, the individual place was lost and the workman became valuable only as he was combined in co-operative action with thousands of others similarly engaged.

There was no apparent reason for paying different wages to different men running the same type of machine; so the system of standard wages which had fallen into disuse during the latter part of the craftsman period, came again into general use and the union was born of standard wages to obtain the right amount of standard wages for a standard operation by standard methods of bargaining.

For a standard amount of time, therefore, involved in the same type of operation the standard wage has become the usual method, and while it is not subject to legislation it has been the subject of an increasing amount of collective bargaining, the workers of the one specialization getting together in order to be in a position to secure the highest standard for that operation.

Between 1800 and 1860 the right of private contract and the lack of general organization among the workers led to chaos under which the conditions of the workers in many lines of endeavor were appalling. Wages given in a competition with starvation and frequently under scandalous system of piece-work requirement, boarding the workers, payment of part of the wages in truck, long hours and unsanitary conditions of workshops are all recorded frequently as the result of the observation of competent and impartial observers.

### Wage Question Always Prominent

The rapid extension of the specialized industrial system, by which the tasks are being divided constantly, and the progress in labor organization have brought the question of wages to the front in the minds of all who have the work of labor management.

Higher standards of pay have been one of the demands of labor in almost all of the disputes which have arisen between the owners of industry and the workers.

Furthermore, standards of wage have necessarily tended toward standards of performance and the standard of performance has gravitated, just as logically toward a minimum. For most persons, workers of all classes not excepted, individual recognition is necessary in order to secure the maximum of accomplishment. Consequently the general presence of standard wages with its absence of individual recognition has led to the practical limitation of output and the jealous guarding of the subdivisions of specialization created originally by the necessities of industry.

Various systems of bonus for increased accomplishment, profit sharing and other attempts to provide the individual recognition necessary for incentive have been tried by individual manufacturing concerns with varying degrees of success.

These when they are fair and just and are arranged so that they win the worker's confidence, by the manner of their presentation and the character of their enforcement, are long steps in the right direction; but for much work they are not applicable and they are against the recognized platform of the labor organization as such.

That the labor organizations are against it is logical, for these are collective bodies, which do not thrive upon the recognition of the individual but upon the subordination of the individual to the precedents and traditions of the organizations themselves.

Furthermore, they are political bodies in character, acquiring their strength from the numerical weight of memberships. Their leaders must secure their mandate from the majority of the workers and the mediocrity of the majority must govern their actions.

The labor organization, formed to protect the interests of the workers of a particular occupation, not designed to assert their rights as individuals, can offer no solution for the wage trouble.

In fact, their best efforts must be spent, continually, in the extension of the standard wage scale and the increase of the relative amount of that standard. How far they are prepared to go in this cardinal principle of their organization tenets is indicated by the demand of the Labor Party in Great Britain for a national minimum wage as guarantee of living to all workers.

### Base Is Point of Interest

It is evident, however, that all the workmen engaged in the same kind of work in a factory are interested in the base upon which wages will be considered, whether that base be piece-work or time. They will continue to demand a collective hearing upon the subject, for they have a common requirement as to their work and a common ground as to their general necessities.

Unless the manufacturer is willing to accept this principle of collective bargaining, or the collective discussion of the wage problem with the workers at interest, he must face the alternative of being obliged to bargain collectively with the general body of labor in whom he is not particularly interested and who have no particular interest in his individual concerns.

It is upon this question more than any other that the council table of co-operation between individual employer and worker through some adequate and equitable system of representation is essential.

Collective bargaining is a fact, it is an increasing necessity—the question of whether the manufacturer believes in it or not is unimportant, the condition is upon us and the time for arguing upon its abstract merits and demerits is passed.

# What Langley Did for the Science of Aviation

Experiments Continued with Rubber-Driven Models and Others Using  
Compressed Air, Carbonic Acid Gas and Electric Batteries  
—Steam Adopted as Source of Power

## PART II

IT is safe to say that previous to the successful accomplishment of Dr. Samuel Pierpont Langley, in obtaining sustained free flight by means of steam-driven model aerodromes, no such mechanism or any type of heavier than air machine had ever sustained itself in the air for more than a few seconds. Upon the 6th of May, in 1896, Langley's Steam Aerodrome No. 5 flew for 1 min. and 30 sec., and during that time covered approximately 3300 ft., which means that it traveled at a speed between 20 and 25 miles per hour. That brief period, during which his model flew, was the result of more than 9 years of the most exhaustive research and unceasing application. Langley worked at his laboratory experiments and his field trials for nearly a full decade before he satisfied himself that he had actually been able to produce sustained mechanical flight.

In the introduction to his "Memoir on Mechanical Flight," Langley included a paragraph which can well be quoted here, in order that we may have a true conception of the state of the embryonic art at the time that Langley began his work in it.

"I desire to ask the reader's consideration of the fact that even 10 years ago [this was written in 1897] the whole subject of mechanical flight was so far from having attracted the general attention of psychists or engineers, that it was generally concluded to be a field fitted rather for the pursuits of the charlatan, than for those of the man of science. Consequently he who was bold enough to enter it, found almost none of those experimental data which are ready to hand in every recognized and reputable field of scientific labor. Let me reiterate the statement, which even now seems strange, that such disrepute attached so lately to the attempt to make a 'flying machine,' that hardly any scientific men of position had made even preliminary investigations, and that almost every experiment to be made was made for the first time. To cover so vast a field as that which aerodromics is now seen to open, no life-time would have sufficed. The preliminary experiments on the primary question of equilibrium and the intimately associated problems of resistance of the sustaining surfaces, the power of the engines, the methods of their applications, the framing of the hull construction which held these, the construction of the propellers, the putting of the whole in initial motion, were all to be made, and could not be conducted with the exactness which would render them final models of accuracy."

In taking up the second part of his work in aviation, Langley aims not to produce flying machines of man-carrying capacity, but rather merely to demonstrate that mechanical flight was possible, and his efforts during this period were directed to the securing within the years

which he devoted to them, and which he regarded as an all-too-short space of time for the accomplishment of such an object, a demonstration of the kind which would be conclusive in the eyes of scientific men, as well as of a general public, which was, he held, nothing short of actual flying.

When his aerodrome, No. 5, built chiefly of steel and driven by a steam engine, had flown for more than half a mile, had alighted safely, and had performed a second flight on the same day, he felt that he had at last made such a great step as to provide the long-desired experimental demonstration of the possibility of mechanical flight.

In April, 1887, Langley began his experiments with rubber-driven models, at the Alleghany Observatory. They were continued at intervals for three or four years, part of the time at the observatory, but for the most part in Washington. During this period, between 30 and 40 different models were constructed. Besides this, each one of the different models was altered a great many times, so that in reality, during the time that he was working with them, a total of something more like one hundred models were really tried out.

It will be understood that the models referred to here are those which were built before he undertook the propulsion of models by steam, and they were driven by the power developed by rubber bands untwisting or unwinding after having been twisted or wound up.

Following the experiments with the rubber-pull models came others with models driven by motors using compressed air, carbonic acid gas, and electric batteries. None of these models proved at all satisfactory, nor gave

Front and side elevations of one of the several rubber-pull aerodromes with which Langley experimented before making his steam power driven models

Side view of steel frame of aerodrome No. 5 suspended from launching car Oct. 24, 1896. This aerodrome and also No. 6 were light steam-driven models, with two pairs of main planes and two propellers located between them. The power plant as shown in this illustration consisted of D, a compressed air tank which forced the gasoline from the tank I, through the burner N, from which the flame of Bunsen type projected into the tubular boiler O. The steam generated here passed into the separator M, from the top of which it was led to the single-cylinder engine located in the center of the model. This engine was 33 cm. diameter by 70 cm. stroke, with slide valve, and weighed 464 grams. Power was transmitted to the propellers by shafting and bevels

as good results as had been obtained from the models which were rubber driven. In fact, the chief benefit derived from the rubber models was that they convinced Langley that he must seek some other source of power, which probably would be the steam engine, before he would be able to demonstrate that flight could be attained.

At the beginning of his experiments with models, it was necessary, as Langley points out in his memoirs, to determine the relationship of the center of gravity and the center of pressure. A great deal of experimentation was necessary to determine just what this relationship is. Another difficulty encountered was in finding some satisfactory method of launching his models in the air, and this difficulty increased as the models became larger.

### Anticipated Present Launching Methods

"It is frequently proposed," said Langley, in his record of the experiments, "by those unfamiliar with this difficulty, to launch the aerodrome by placing it upon a platform car or upon the deck of a steamer, and running the car or boat at an increasing speed until the aerodrome, which is free to rise, is lifted by the wind of resistance. But this is quite impracticable without means to prevent premature displacement, for the large surface and flight weight renders any model of considerable size unmanageable in the least wind, such as is always present in the open air. It is, therefore, necessary in any launching apparatus that the aerodrome be held rigidly until the very moment of release, and that instance a simultaneous release from the apparatus be made at all the sustaining points at the proper moment."

It is interesting to note that the method of launching which Langley found to be impossible at that time with his models is essentially the very manner in which aeroplanes are launched from the earth to-day, the only difference being that instead of being carried on cars, they carry their own cars with them.

The first attempt, at the beginning of his experiments with rubber-pulled models, was made with one which consisted of a frame formed by two pieces of wood, each about one meter long and four centimeters wide. For the sake of lightness they were of star-shaped section, and were braced with cross pieces. They carried two long strips of rubber, each about one millimeter thick by 30 millimeters wide and 2 meters long. These rubber strips were doubled, and weighed 300 grams. It was possible to wind each of these strips to about 300 turns. One end was made fast to the front of the frame and the other to the shaft of a four-bladed propeller having a diameter of 37 mm. Light pine frames were used for the wings, and over these frames paper was stretched. The wings were double, one being superimposed upon the other. The wings were 15 centimeters wide by 120 centimeters long, and the distance between them was 20 centimeters. They gave a total surface of little more than 3600 square centimeters, or about 4 sq. ft.

The propellers were driven in opposite directions during flight. The whole apparatus weighed about one kilogram or something like 1 lb. to each 2 ft. of sustaining surface, and this weight proved to be entirely too great for the power provided.

### Whirling Table Tests

A test on the whirling table showed that the model would tend to soar at a speed of about 10 miles an hour, but its own propelling mechanism was not sufficient to sustain it in the air. The fundamental difficulty disclosed by this model and by others which followed it was that of making the model light enough and sufficiently strong to support the power required to drive it. Other difficulties encountered were, as Langley enumerated them, "the adjustment of the center of gravity to the center of pressure of the wings, the disposition of the wings themselves, the size of the propellers, the incli-

*Plan of the framework of Langley's No. 6 aerodrome, which was a development of No. 5 and differed from it only in a few details. Instead of the single-cylinder engine, two engines were used, one for each propeller, mounted at S S on the outrigger. The propellers were direct driven by the crankshafts, which, however, were connected by a cross shaft so that both went at the same speed*

nation and number of their blades, and a great number of other details which presented themselves from time to time."

Two other models, each with a single propeller, were constructed and ready for trial by June of 1887. One of these had an 18-in. propeller with 8 adjustable blades, and the other a 24-in. propeller with four adjustable blades. Each had two pairs of wings, which were curved and were 4 ft. 7 in. long. These models also proved too heavy in relation to their power, and neither succeeded in actually making flights.

Two years later Langley discarded the wooden frame idea and adopted instead frames made of tubes of light metal. These in turn were superseded by frames constructed from tubes, wound from paper, covered with shellac, and they proved to be the lightest and best material, in proportion to the strength provided, which had been found up to that time. The rubber strips were carried within these tubes, which of course had to be strong enough to withstand the end thrust imposed upon them when the bands were twisted up. The propellers used with the aerodromes made in this way were of the four-bladed type.

The weight and size of the models which Langley made at this time were too great to permit of their being launched by hand, and it was not until 1891 that a model light enough actually to fly was constructed.

Work with models of this kind was carried on until 1893. Usually the wings were flat. In some cases they

were curved. Some of them had two propellers, some of them had only one. In some, one propeller was in front and the other behind. Some were fitted with single wings, some with two pairs of wings, some with wings superimposed.

To quote Langley again, "The advantages and also the dangers of curved wings as compared with plain ones, were shown, and the general disposition, which would secure an even balance, was ascertained, but all this was done with extreme difficulty, since the brief flights were full of anomalies, arising from the imperfect conditions of observation."

The longest flight obtained with any of these models was not for more than 6 to 8 sec., or from 80 to 100 ft. They were so brief that the obtaining of data necessary for the making of improvements was most difficult.

In his efforts to find a suitable means of propelling his models, Langley gave careful consideration and made experiments with not only the rubber motors, which drove the models, considered up to this point, but steam, which he finally adopted; gun powder, hot water, compressed air, gas, electricity and carbonic acid gas.

### Stringfellow's Engine Unsatisfactory

The construction of the first steam-driven model was begun in November, 1891. Langley was forced to work without precedent or example. He was not trained in steam engineering, and when he called upon those who he thought might assist him with his problem, he found that they were unable to offer him any material assistance, as his undertaking was so new and so radically different from anything with which they were familiar.

The lightest steam engine which had been developed up to that time was the Stringfellow, which had been exhibited at the Crystal Palace in London in 1868. It was capable, so it was claimed, of developing one horsepower for a total weight, including boiler and engines, of 13 lb. This engine came into the possession of the Smithsonian Institution in 1889. Investigations soon disclosed that it never had nor ever could develop the power claimed for it.

Langley had concluded from his experiments on the whirling table at the Alleghany Observatory that one horsepower was sufficient, with a plane "whose efficiency should be equal to that of a 30 x 4.8 in. plane set at an angle of 5 deg. and moving at a speed of 34 miles an hour," to propel 120 lb. He figured that with a smaller angle he could secure even better results, but concluded that the difficulties of guiding would increase as the angle diminished. He realized that no allowance had been made in the computation for the fact "that the results were obtained by means of a mechanism which forcibly maintained the supporting surfaces in the ideal condition of the best attainable angle of attack, as if in perfect equilibrium, and above all in the equally ideal condition of perfectly horizontal flight." The guide wires and the hull also contributed their share of factors to be given consideration. After taking all these things into consideration, Langley decided that one horsepower would serve to carry 30 lb. in flight, provided a supporting surface of at least 3 ft. to the pound could be obtained. Upon this basis the first steam-driven aerodrome was constructed.

It is interesting to note that the completed model actually weighed 44 lb. and 8 ounces as against an estimated weight of 27 lb. 11 ounces.

### Used a Mackerel Shaped Hull

For the shape of the hull, Langley decided to adopt the lines of the mackerel as being the most advantageous from the point of view of air resistance, but structural difficulties entered into the making of the hull, and the

Instruments designed and made by Langley for the purpose of obtaining data which he used in the construction and operation of his many model airplanes. These instruments were attached in turn to the end of the whirling table shown in another of the illustrations herewith, and the various results recorded by pencil on the instruments themselves or electrically by the use of a recording chronograph.

Plan of the grounds at Alleghany Observatory, showing the buildings in which Langley conducted his experiments in aeronautics, and the 60-ft. whirling table which he used for his velocity experiments with planes.

lines, therefore, did not follow the plan intended, the bow and stern being of the same shape.

The construction of a suitable boiler also gave Langley a great deal of trouble. He constructed an almost endless number of them, varying more or less in type, before he secured the one with which his successful aerodromes were driven.

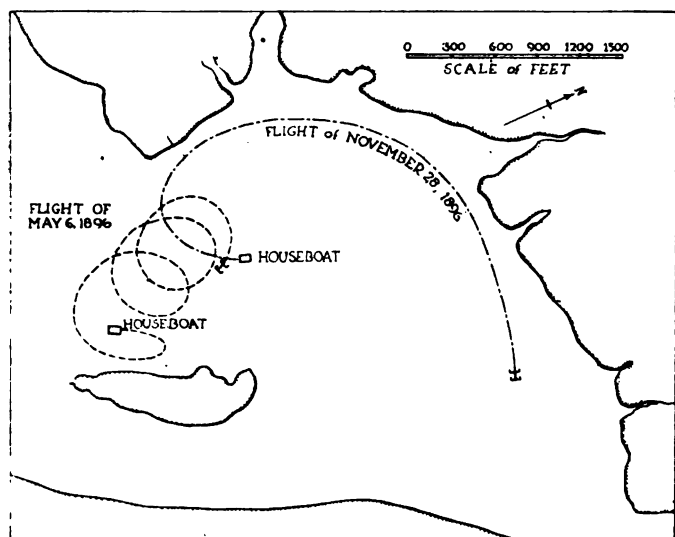

During the years 1892 and 1893 four steam-propelled aerodromes were constructed. They were known as Nos. 0, 1, 2 and 3. No. 4 was under construction by the end of March, 1893. Detailed descriptions of all these preliminary steam-driven models would be interesting, but space does not permit of giving them here. It would be well to pass them over hurriedly and to take up in greater detail the construction of Nos. 5 and 6, which were the ones whose performance satisfied Langley that he had actually obtained the results he sought.

The framework of aerodrome No. 5 was made of thin steel tubes. The main tube or midrod, as Langley called it, extended for the whole length of the machine, and carried the various attachments to which the wings were secured. A skeleton hull of steel tubing was suspended from this midrod. It was shaped somewhat like the frame of a boat, and arms ran out from the sides for carrying the propellers. The engine, aeolipile and boiler were placed within this hull. Together with the pump and separator they constituted the complete power generating portion of the model.

There were four principal parts in the aeolipile. They were the spherical air chamber which contained a supply of compressed air by means of which gasoline in the tank was forced into the burner, the tank which contained the gasoline used as fuel, the gas generator, in which liquid gasoline was converted into gas, and the burners where the fuel was burned to generate steam in the boilers.

The boiler consisted of a separator and generating coils, and was fitted with circulating pumps. The generating coils consisted of two windings of copper pipe, which had an outside diameter of 10 mm. and which were formed into 21 turns, 77 mm. in diameter on the outside. The turns were spaced 7.5 mm. apart, so that the total length of each coil was 36 cm.

The boiler was sheathed in a sheet of mica and at the front end by a strip of thin sheet iron as well. The stack was made of thin sheet iron and was slipped over the rear end.

*Plan of the most successful flight of aerodrome No. 6 near Quantico, Va., on Nov. 28, 1896. The distance traveled was about three-quarters of a mile*

The engine was of the slide-valve type, having a piston valve. The piston was without packing rings. The cylinder was made of steel tubing 35 mm. outside diameter and the heads were secured to flanges on the ends by means of machine screws. A thin cast-iron bushing was fitted inside of the steel tube. The bore was 33 mm., stroke 70 mm. The complete engine weighed 6.4 lb.

Bevel gears and shafts were used to transmit the power of the engine to the propellers, which were 1 mm. in diameter, and had an axial pitch of 1.25 m. They were made of white pine, in strips, 7 mm. thick, glued together. They were most carefully balanced, each blade with its mate, and each propeller with the other. They ran in opposite directions. The weight of each was 362 grams.

The photographs accompanying show the wing construction better than it can be put into words.

Aerodrome No. 6 differed from No. 5 in certain structural details, but not radically in general design. One difference was that two engines were used in No. 6 instead of one. They were located on the transverse frame, and their power was applied directly to the propellers. The cylinders of these engines were 2.8 mm. in diameter, with a stroke of 5 cm. The steel cylinders were lined with cast-iron bushings, and the pistons had cast-iron rings.

No. 6 was lighter than No. 5 and required much more careful handling and adjustment. Its flying qualities, however, were superior both as to speed and stability, when once these adjustments were correctly made.

The flying of these aerodromes was accomplished over the waters of the Potomac River. They were launched from the top of a houseboat anchored in the middle of the stream. On the roof of a house a platform was constructed, and the launching was accomplished by means of an overhead rail and suitable releasing mechanism.

### The Most Successful Flight

For a description of the most successful flight of aerodrome No. 6, which was also the most successful flight accomplished by any of the Langley models, and was accomplished on Nov. 28, 1896, let us use the words of the Langley Memoir:

"The aerodrome was launched at a steam pressure of not over 100 lb., the airdraft for the burners being temporarily bad. The midrod made an angle of approximately 3 deg. from the horizontal. On account of a slight rain, which had occurred just before the machine was launched, the wings were wet and the weight of the entire aerodrome was doubtless as much as 12 kilo. Immediately on being launched the aerodrome started directly ahead in a gentle south wind, moving horizontally and slowly turning to the right and appearing to approach dangerously near to some thick woods on the west shore. However, it fortunately continued turning until it pointed directly up the beach with the wind in the rear. It then moved more rapidly forward, dipped and rose but once, and this very slightly, and continued its remarkable horizontal flight, varying not more than 2 yards out of a horizontal course, and this for only a moment, until it finally descended into the bay at a point nearly in a line between the houseboat and the railroad station at Quantico.

"Upon being recovered it was found to be absolutely uninjured, and another flight would have been made with it immediately, but the darkness had descended. The time of flight, as determined independently by two stop watches, was 1 min. and 45 sec. The number of revolutions of the propellers was 2801, or at the rate of 1600 revolutions per minute, which, with an allowance of 50 per cent slip, should have carried the aerodrome a distance

(Continued on page 738)

# Single-Feed System Oils Car from Seat

Multiple-Plunger Hand Pump and Reservoir  
Supplies Oil Under Pressure to All  
Points on Chassis

THERE has been a noticeable tendency toward the use of oil for the lubrication of car and truck chassis during the past two years. Now comes a centralized system of lubrication, the Semco-Skelly, in which a reservoir furnished with a number of tubes feeds oil under pressure simultaneously to the points on the chassis requiring lubrication, by a few turns of a small lever situated at the driver's seat. The manufacture is now in progress on this new lubricating system by the Smith & Egge Mfg. Co., Bridgeport, Conn. It consists of a sheet steel reservoir inside of which is placed a multiple pump with a separate plunger for each of the tubes. Shown in one of the illustrations, these plungers are arranged in parallel sets of fifteen, with a cam above each plunger. These cams give  $\frac{3}{8}$  in. throw and are geared together, 180 deg. apart, at the end. An extension of one of the shafts is fitted with a ratchet handle which projects through the front of the seat. The overall dimensions of the unit are 12 in. by 4 in. by 7 in. high.

As shown in the sectional drawing herewith, the plungers are ring-returned and double-ball intake and delivery valves are used in the pump. In the model now being made there are separate plungers. A corresponding number of flexible tubes  $\frac{5}{32}$  in. in diameter are carried along the chassis members and the ends fitted into the holes left vacant when grease cups are removed. The ends of the tubes are with unions each containing a spring ball check which the oil in the system and prevents leakage after the pressure has been removed.

Points reached by this system include all spring shackle steering heads, brake connections, pedals, rear axle pads, etc. In the case of the shackle bolts, the tubes are drilled to the inside of the bolts instead of outside, which is the usual position for grease cups, so that they can be carried on the inside of the frame members, where they are out of the way.

At practically all other points the union fitted to the end of the tube is simply screwed into the grease cup hole. The tubes are clipped to the chassis members and taped to prevent any possibility of rattle, and the tube is sufficiently flexible to take care of the relative movement of the rear axle frame. The rear axle tubes are carried along the radius.

In the car fitted with this lubricator, in use for more than a year, no trouble was experienced in zero weather.

Above—The Semco-Skelly lubricator, showing the ratchet handle which operates the multiple pump. Oil is delivered through the thirty connections at the side. Below—The multiple plunger pump is a single casting, drilled vertically to form the cylinders

Sketch showing the attachment of the flexible steel tubes to the spring shackles. The section shows the ball check installed in each union to prevent leakage of oil

# Avery 5-10 Orchard and Farm Tractor

One of the Smallest Machines on the Market Recently  
Redesigned—Will Pull Any Three-Horse Farm  
Implement and Do Belt Work

By P. M. Heldt

**W**HAT is undoubtedly the most extensive line manufactured by any single firm in the tractor field is that of the Avery Co., Peoria, Ill. The line comprises seven different models of tractors, of which six are of exactly the same pattern, whereas the smallest one, the 5-10 hp., is designed on somewhat different lines. This tractor is specially suited for work in orchards, on account of its compact size, and it can be used also for all ordinary kinds of farm work. As a plowing tractor it is recommended to haul two 10-12-in. bottoms, or one 16-in. bottom.

The engine, a four-cylinder, vertical block type, with L-head cylinders, has 3-in. bore and 4-in. stroke. The cylinders are cast integrally with the upper half of the crankcase. The crankshaft is supported in two die-cast bearings, and is  $1\frac{3}{4}$  in. in diameter. The valves are of  $1\frac{1}{8}$ -in. diameter and have a lift of  $\frac{5}{16}$  in. Detachable cylinder heads are used, and the wrist pins are tight in the pistons. The cam followers are of the mushroom type and are provided with means of adjustment in the shape of a number of shims located in a socket formed in the tappet. The bottom half of the crankcase is also of cast iron and is provided with shelves on the inside to which are riveted the sheet metal splash troughs. A centrifugal governor is fitted and keeps the engine running in the neighborhood of 1200 r.p.m.

Gasoline is recommended as fuel, although a gasifier is fitted and some owners have been using kerosene. The gasifier is similar to that used on other Avery models and consists essentially of a combination inlet and exhaust manifold. Eleven gallons of fuel are carried in a tank located crosswise of the frame directly behind the engine. The carburetor is either a Kingston or a

Zephyr. Atwater Kent ignition is used, with hand control.

Lubrication is by the circulating splash system, the oil being circulated by means of a plunger pump, bolted to the outside of the crankcase and driven by an eccentric on the camshaft. This pump takes the oil from the sump and delivers it to the splash troughs. All internal parts are lubricated by splash in the crankcase. A float type of indicator shows the level of oil in the case. Cooling is by water which is circulated through a tubular radiator of the company's own make by thermo-syphon action. Back of the radiator is located a  $15\frac{1}{2}$ -in. fan, which is driven at twice crankshaft speed through a  $1\frac{1}{2}$ -in. flat belt. Three-point support is used for the engine.

The clutch is of the dry-plate type, and its control is on automobile lines in that it is held in engagement by a spring. Back of the engine is located a three-speed-and-reverse gearbox, which operates on the selective sliding principle. All gears are cut from chrome-nickel steel, and are heat treated. The three speeds are  $1\frac{1}{2}$ ,  $2\frac{1}{8}$  and  $4\frac{1}{4}$  m.p.h. The transmission gears are mounted on Hyatt roller and ball thrust bearings. Combined with the change-speed gear is a cross shaft driven through a pair of bevel gears. It will be understood that the primary and secondary shafts of the gearbox are in line with and parallel to the crankshaft, respectively, and a set of bevel gears is therefore required between the change gears and the final drive. The cross shaft at one end carries a spur pinion, which meshes with a gear on the differential shaft. The latter at its ends carries the bull pinions, which mesh with the bull gears on the rear wheels.

Rear wheels of 38 in. diameter by 10 in. width of rim

Avery 5-10 hp. tractor hauling Oliver disc harrow

*Another view of the Avery 5-10 hp. tractor*

sed, these being of the built-up type, and provided driving lugs. The front wheels, which are 28 x 10 in dimension, are cast and have the guiding rings integral with them. The rear axle is 2 in. in diameter. The front axle is of the automobile type and is in a swivel connection with the frame at the center. The front wheel hubs are bored out to form a bearing for the front axle spindle. Of the total weight of 2600 lbs, only about 25 per cent rests on the front wheels. Steering is therefore comparatively easy. In order to enable the tractor to turn in a relatively small circle, the frame is narrowed at the front. In this way a minimum turning radius of 10½ ft. is obtained. Steering is accomplished by means of a 16-in. hand wheel at the rear end of a horizontal shaft, extending over the engine hood. The steering motion is reduced at the forward end through a bevel pinion and gear and a spur pinion and gear. This sector is mounted on a shaft extending up through a high bracket secured to the fore part of the frame. At the bottom of the bracket the shaft carries a hand wheel extending lever, which is connected by links to the steering knuckles.

A pressed steel seat is fitted, which can be adjusted up and down and swings sideways. There are two pedals, one for the clutch, which is provided with a hand brake, and the other for the brake, which acts on the differential gear. Two control levers, for the spark and throttle respectively, are mounted on a bracket on a cross bar in front of the driver. A swing-draw bar is fitted, to enable the driver to make a U-turn. The exhaust pipe is divided into two sections, which discharge close to the bull pinions, tend to keep the pinions lubricated and clear of dust.

The frame is built up of 4-in. channel steel, weighing 150 pounds to the foot. Steel plates are riveted to the channel at the forward end. There is a platform at the rear for the driver. The rear axle is a one-piece job, bent down, passed through holes in the frame members, and held in place by means of brackets. A metal hood extends over the top of the engine and is bolted down the sides, the side portions being bolted to the center portion, which is about 10 in. wide. The hood rests on two arch-shaped steel strips which are bolted to the frame, and is held in place by means of wing latches.

The tractor is provided with a 12 x 5-in. belt pulley, on the left side, in plain view of the operator. One of the features on which considerable emphasis is laid by the manufacturers is the large size of the bull gears. These are semi-steel castings, with a face of 2¼ in., and are bolted to the driving wheels by means of six lugs. The driving wheels, as already stated, are of the built-up type; that is, they comprise a central cast-steel wheel to which an extension rim is bolted. As to the capacity of this tractor, the company states that it is designed to pull a three-horse load, but on account of its greater speed and greater endurance, it will ordinarily accomplish the same amount of work in a day as four horses.

The price of this tractor is \$550, which makes it probably the lowest priced farm tractor on the market.

### Guide Tractor Lamp

A FIELD tractor lamp for night plowing and other night field work is manufactured by the Guide Motor Lamp Mfg. Co., Cleveland. It is of special heavy-duty construction and made dust and water tight. A lens, specially designed for the purpose, throws a broad, clear beam of light about 120 ft. forward, and spreads it to about 60 ft. at right angles to the tractor. The front diameter is 7½ in., and the lamp can be furnished either with prop standards or with an extended arm.

As yet only few tractors are equipped with electric lighting outfits, but the subject is receiving the attention of both tractor manufacturers and makers of electrical equipment. The outfits must be made specially robust for this service, on account of the severe short-period vibration in tractor work.

# Handling Employment Relations Without Help from the Outside

A Collective Bargaining Plan Comprising an Organized Business Government for Handling Entirely Within Any Establishment All Matters Relating to Wages, Hours of Labor, Discipline, Discharges and Grievances

**A** SO-CALLED collective bargaining plan, now in operation in a Middle Western concern, but which may be applied in any manufacturing establishment, which provides for the collective bargaining between an employer and his own employees, without the intervention of any union outside the establishment, is described by Boris Emmet, Ph.D., in an article which has just appeared in the *Monthly Labor Review* of the U. S. Department of Labor. The plan has been thoroughly tried out by three years' operation, and has resulted in putting on a collective basis the wage bargaining of the establishment, as well as the hours of labor, discipline, discharges and adjustment of grievances.

Under the scheme there are three separate bodies, known respectively as the senate, the cabinet and the house of representatives. The senate and the cabinet, both of which represent the interests of the firm, were created simultaneously in June, 1914. The organization of the employees, termed the house of representatives, was created one year later.

The members of the senate are salaried employees directly connected with the planning of the work of the institution, namely, heads of departments, their assistants, superintendents and their assistants. Application for membership must be submitted in writing to the secretary of the senate after the applicant has secured the indorsement of the firm and of at least one member of the senate. A majority vote of the members present is required for election. Membership ceases upon termination of employment with the company. Each member of the senate has one vote. By a two-thirds vote of the members present the rules and regulations governing the deliberations may be amended. Regular meetings are held once a week, but special sessions may be convened whenever occasion arises. The officers of the senate are a president, vice-president, treasurer, secretary and sergeant-at-arms, all elected by the membership for a term of one year.

## Election of Representatives

The members of the house of representatives are elected from among those employees of the company who have been in continuous service for at least six months. This qualification is at present relatively unimportant for the reason that four-fifths of the employees of this company have been in its service more than six months. The representatives are elected by popular vote of the employees, in the ratio of 1 representative for every 15 employees, but each department, however small, has at least one representative. Each member of the house has 1 vote. The officers of this organization include a president, vice-president, treasurer, secretary and sergeant-at-arms, all elected by popular vote. Elections are held regularly twice a year, during the first weeks of February and August. Regular meetings of the employees' representatives are held every other Tuesday and special meetings may be called whenever necessary. The rules of procedure of the body may be amended by a two-thirds vote of its membership.

The cabinet consists of members of the executive board of the company, and has the final word in all matters referred to it by the joint action of the house and senate. Members of the cabinet may attend the meetings of either the senate

or the house, but have no power to vote. Unless especially requested, however, members of the firm do not, as a rule, attend any of the sessions of the representative organizations of the employees.

The jurisdiction of the house and senate is unlimited. These bodies are privileged to discuss and act upon any proposition that may affect the interests of the employees and the firm. A proposition may originate in either house, but must also be referred to the other house for discussion and action there. In case of disagreement in the decisions reached the disputed points are referred to a joint conference committee consisting of an equal number of representatives of both organizations. The conference committee endeavors to reach some mutually satisfactory compromise, and usually succeeds. The compromise is then submitted to the cabinet for approval. As a matter of actual practice, propositions agreed to by both houses in the manner indicated above are usually assented to by the firm.

## Joint Standing Committees

Under the provisions of the scheme there are a number of standing committees consisting of an equal number of representatives from both organizations. The most important of these are the betterment committee, which hears complaints and adjusts grievances, and the welfare committee, which deals with matters affecting the general comfort and welfare of the employees. There are many other committees, mostly of minor importance, such as a committee on appropriations, in charge of expending the funds annually appropriated by the company for entertainments, athletics, etc., a program committee for entertainments, and a fire-drill committee. New committees are created whenever necessity arises for handling special questions.

A discharged employee has the right to refer his case to the betterment committee. If the decision of the betterment committee is not satisfactory to the employee, he may file a notice to that effect with the "professional" secretary of the house of representatives and the senate. The latter two organizations then select a board of review consisting of five persons, two selected by the senate, two by the house, and the fifth by mutual consent of both organizations. The majority decision of the board is final. The board has full power over discharge cases and may reinstate any employee who, in its opinion, was wrongfully discharged. The company, however, specifically reserves the right to lay off employees on account of lack of work, and a lay-off, even when in effect equivalent to a discharge, is not subject to the jurisdiction of the board.

By a special resolution adopted April 17, 1918, a permanent wage committee was created. This committee is composed of one member selected by the employees of each factory department and one employee chosen to represent the office and clerical force of the firm. The functions of this committee, as defined in the resolution, are as follows: (1) To recommend and pass upon general changes in wages; (2) to suggest and pass upon minimum and maximum rates to be paid for the various operations according to skill involved, length of service, and steadiness in attendance; (3) to sit with the

factory planning board, composed of the superintendents, for the purpose of passing upon individual increases in wages; and (4) to receive complaints of individuals to whom increases were denied.

That this collective bargaining scheme has been of benefit to the employees may be seen from the list presented below, enumerating some of the more important matters dealt with and adjusted collectively, as well as from the brief account given later of the changes in wages during the last 18 months.

Ordered that raw materials be sold to employees at cost plus 15 per cent.	Apr. 23, 1915
Ruled that no freight be carried on elevators between 7.15 and 7.45 a. m. and 11.30 a. m. to 12.15 p. m.	Feb. 22, 1916
Ordered that 1 week's vacation with pay be granted to those in service 1 year or longer.	Apr. 25, 1916
Introduced a 48-hour week.	June 16, 1916
Ordered that 2 weeks' vacation with pay be granted to those in service more than 3 years.	May 20, 1916
Decided that, whenever possible, promotions be made from rank and file.	Sept. 19, 1916
Employed a "professional" secretary for the house and senate.	Jan. 10, 1917
Granted increases in wages of 5 and 10 per cent.	Jan. 23, 1917
Formulated rules of procedure to govern a board of review to handle discharges.	Jan. 10, 1917
Decided that the positions of enlisted men be held open for them.	May 29, 1917
Granted an increase in wages of 5 per cent.	June 20, 1917
Agreed to readjust wages in accordance with the changes in the cost of living.	Jan. 23, 1918
Created a permanent committee to deal with wage questions.	Apr. 17, 1918

In these days of advancing prices the attention of employees is centered on the question of wages. Since the beginning of 1917 the question of wages has been the subject of frequent discussions of the representative bodies. The procedure of arriving at wage changes was somewhat as follows: The workers, feeling the need of larger incomes, usually called a meeting of their representatives and by resolution instructed them to make certain demands for increases in wages. The matter would then be taken up at the next meeting of the house for the purpose of arriving at a definite figure. As a rule, the house, being more familiar with the general conditions of business, modified considerably the demands of its constituents. The figure agreed upon by the house would then be referred to the senate. The latter, after detailed discussions and informal conferences with the management, then arrived at some decision. In cases of disagreement the matter went through the regular procedure of reference to a joint conference committee and then to the firm, which, in the great majority of instances, approved the compromise arrived at by the joint conference committee.

On Jan. 29, 1917, an increase of 10 per cent was granted to employees with a continuous record of one year or more, and of 5 per cent to those in service less than one year. On

June 20, 1917, an additional all-round increase of 5 per cent was given.

In the early part of December, 1917, the representatives of the employees, in view of the still mounting cost of living, submitted a demand for an additional all-round wage increase of 10 per cent. The matter was referred to the senate, where it was discussed at great length. The opinion prevailing in the senate was "that inasmuch as it would not be right to ever cut wages, it might be unwise to grant increase after increase, as the cost of living rises, if such raises are made permanent, \* \* \* but that temporary raises as long as this high cost of living remains on the same level, or goes up, are necessary." In view of the difference in the viewpoints of the house and the senate the subject was referred to a joint committee, which was instructed to work out some equitable method for the adjustment of wages to the rising cost of living. The action of this committee was announced on Jan. 9, 1918. It suggested that periodic (monthly) changes in wages be made in accordance with the changes in the prices of commodities. A resolution to this effect was passed and subsequently approved by the firm. In accordance with this resolution, the company on Jan. 23 made the following announcement:

The company believes there is justice in the suggestion that the wages of the employees be readjusted in accordance with the higher cost of living. It wishes to meet the suggestion by paying a separate high-cost-of-living envelope to each employee once a month. This envelope will contain an amount of money which will represent the average increased cost of living to each employee.

This amount will be figured by using Bradstreet's index figures as a basis. These index figures represent an average of the prices of 96 articles used in everyday life. As the prices change, these index figures change, so that they are a fair measure of the increase in the cost of living. These figures have been used by Bradstreet's since 1904 and are recognized all over the United States as being impartial and reliable.

As these monthly index figures are not available until the 15th of the month the index figures of November the 1st will be taken instead of December 1st, and this November the 1st figure will be continued to be used as a basis. Therefore, the high-cost-of-living envelope for December will be the percentage of difference between the index figures of November the 1st and December the 1st. The high-cost-of-living envelope for January will be the difference between November the 1st and January 1st, and so on. This payment will be made on the second Tuesday of every month.

The company does not obligate itself to continue this payment indefinitely, and as soon as circumstances arise that make this payment unnecessary or impossible to maintain the employees will be advised through the house of representatives of this fact.

This new wage arrangement was to be retroactive to December, 1917, when the wage demand of the employees was presented. Since the date of the announcement, the following percentages of the regular earnings of the employees have been paid as cost-of-living bonuses: For the month of December, 1917, 5 per cent; January, February and March, 1918, 6 per cent; and April, 1918, 8 per cent.

Nearly 200 men who have gone into national service have been replaced by women operators in the plant of the Elgin Motor Car Corp. The results have been so satisfactory that the company is planning to enlarge its force of female workers for various kinds of light machine and general factory work.

### HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Fool-Proofing the Tractor Engine

MOTOR truck manufacturers in the early years experienced no end of trouble as a result of the inclination of the drivers to overload their machines. As a preventive, plates were attached to the dashboard warning the driver and owner that the guarantee on the machine would become void if the latter was overloaded; but even this did not seem to have the desired effect. Finally it was concluded that the one effective way to prevent overloading was to so limit the engine power that the truck was incapable of taking overloads up hill. It is far better to so design the truck that it cannot be abused than to trust to the driver's intelligence to prevent abuse.

A similar line of reasoning may be applied to tractors and especially to tractor engines. We hear a good deal of farmers abusing their tractors by hooking on four bottom plows when a three-bottom is all the tractor was designed for. It seems that the

engine is the part which suffers most from such abuse, as the pressures on the bearings are too high and perhaps the cooling system is inadequate to take care of the heat absorbed by the jacket under overload conditions.

Tractor engines should be protected by simply making it impossible to produce excessive bearing pressures and excessive cylinder temperatures. That these engines have not been so designed in the past has been due largely to the fact that they have been evolved from the automobile engine which works under much less severe conditions. Whereas the automobile engine carries an average load of about 20 per cent its maximum, the tractor engine in plowing works at 70 to 80 per cent its maximum load. From this it will be readily perceived that if the tractor engine bearings were no larger, in proportion to the cylinder dimensions, than automobile engine bearings, they would wear out very quickly. As a matter of fact, the tractor engine always has larger bearings, but still they are not large enough. They ought to be so large that even under full load the engine works smoothly, without pounding and without danger of the bearings heating excessively. Then there is no possibility of "abusing" the engine as far as the bearings are concerned. Of course, the engine weight will be increased thereby. There is plenty of chance in most tractors of cutting down weight where such cutting down can do no harm, and even were this possible, it would be preferable to carry around a little additional weight if this would result in a smooth running engine.

Large bearings imply a robust crankshaft, which will not yield appreciably under the stresses imposed upon it. With a substantial crank, large bearing surfaces and adequate cooling capacity, it is absolutely impossible to abuse an engine by overloading it. A tractor engine should not need any nursing, but should be capable of standing up under continuous full-open throttle operation.

## Oil Cooling of Kerosene Engines

BEFORE a liquid fuel can burn it has to be vaporized because only when the fuel is in the gaseous state can its molecules approach sufficiently close to the molecules of oxygen in the air to effect a chemical combination.

As the temperature of vaporization of kerosene extends from about 300 to 500 deg. Fahr., this fuel cannot draw its heat of vaporization from the atmosphere, like high test gasoline, but must have heat supplied from outside sources. This heat may be supplied to the fuel before being mixed with the air, to the air previous to mixing, to the mixture on its way to the cylinder or to the mixture after it has entered the cylinder.

Each of these methods has something to commend it, and all are now in practical use. The difficult problem with most of them seems to be to control the heat supplied to the fuel mixture in accordance with the load on the engine. At low engine loads and speeds the fuel is less energetically sprayed than at high speeds and full load, and as the fuel globules

then are larger, a higher degree of heat is required to effect vaporization in the limited time available, whereas the temperature of the exhaust under these conditions is actually far lower.

If some of the fuel remains unvaporized at the time of ignition, combustion is retarded, with the result that much more heat goes into the waterjacket than would be the case if the mixture were completely in the gaseous state and burned almost instantaneously.

In a four-cylinder engine it seems necessary to supply heat to the mixture before it enters the cylinders, because if the fuel is still in the globular state it is impossible to get equal qualitative distribution, some cylinders receiving a richer mixture than the others, owing to the greater inertia effect on the liquid fuel particles than on the air. In two-cylinder engines there is less danger of such faulty distribution owing to the simple form of the inlet piping and in a single cylinder engine there can be, of course, no question of unequal distribution.

If the mixture is introduced into the cylinder cold, the advantage of a greater volumetric efficiency is gained. The fuel must be thoroughly vaporized before ignition, if the conversion of heat into mechanical energy is to be commensurate in effi-

ciency with that obtained in the gasoline engine.

This is not possible where water cooling is employed, as the water keeps the cylinder wall temperature down to less than 212 deg., and it is impossible to draw heat from a wall at this temperature to vaporize fuel whose vaporization temperature extends up to 500 deg.

It is this condition that has brought about the introduction of oil cooling in tractor engines. Mineral oils can be safely heated to between 400 and 500 deg. and oil at this temperature in the cooling jacket not only insures the vaporization of the fuel introduced into the cylinders in a finely divided liquid state, but it tends to lower the loss of heat to the jacket from the burning charge, by reducing the temperature difference between opposite sides of the cylinder wall.

Thus oil cooling and high cylinder wall temperatures seem to be advantageous from several points of view. There is, however, the question of pre-ignition and consequent knocking to be considered. To eliminate this, either very low compressions must be used or water injection must be resorted to.

Oil is now employed as the cooling medium on a number of tractor makes and we should not be surprised to see the practice extend.

## Italy Stages Automotive Exposition

ITALY, which has been practically in the front yard of the war and which has had to defend her finest cities against attacks, has recognized the essential character of the automobile and other automotive apparatus to the extent that one of her leading manufacturers has assisted in staging what might be designated a war apparatus exposition along the lines suggested in AUTOMOTIVE INDUSTRIES Aug. 24. At that time it was suggested that there be staged in New York and Chicago exhibits of automotive apparatus serving in the war and that the receipts from such an exhibition be turned over to war organizations, such as Red Cross, Y. M. C. A., K. of C., Salvation Army, etc.

The following letter from the Fiat company at Turin, Italy, expresses a lofty sentiment along this line. It shows that in Italy, too, there is necessity for bringing the automobile and all automotive apparatus into their true field in the war:

"Editor AUTOMOTIVE INDUSTRIES:

"By following Mr. Beecroft's suggestion the last remnants of the denigrators of the 'pleasure car industry' would be sensibly reduced, the industry would finally come into its own, viz., the recognition of its *essential* character, and the charitable institutions he alluded to (Red Cross, Y. M. C. A., etc.) would be the richer to a considerable amount to help them with their work.

"The thought that Fiat has for this time forestalled Mr. Beecroft's wishes and had already put in practice the suggestion he makes in his article is very gratifying to us, and we think you will be interested to know that at Bologna we are actually exhibiting in a local show the only output of our war

industry, viz., aero engines, transport trucks and agricultural tractors.

"When we consider that all the efforts of our firm during the last 4 years have been devoted to warlike purposes, you will agree with us that we could not enhance with a better show the actual products of our factory.

"In accordance with Mr. Beecroft's suggestion the profit of the show will be handed over to the Fund for War Orphans and we will be happy in the thought that the industry will have been an instrument in both helping the war and in alleviating the consequent ravages of it.

"We are glad to ascertain the identity of ideas and sentiments which are binding the two Allied Nations, United States and Italy, and we will look forward confidently to the future for a stricter union of the two countries. Hail Columbia!

Yours faithfully,

FIAT, Società Anonima, Torino."

THE call for improvements in internal combustion engines raised in connection with our military aircraft program has resulted in much work being done on rotary valve and sleeve valve engines. However, in airplane work, where weight efficiency is the prime consideration, the poppet valve stands firmly intrenched, and no other valve construction seems to stand any chance of competing with it. There is, of course, a chance that the noiseless sleeve valve and rotary valve engine will receive more consideration in the automobile industry after the war and that experimenters who produce successful engines of this type may yet reap their reward.

# □ Latest News of the

## Detroit Subscribes \$29,868,935

### Automotive Industry Gave the City a Big Push in Going Over the Top

DETROIT, Oct. 21—Automobile and truck manufacturers and those of the allied industries have subscribed most liberally to the Fourth Liberty Loan, in some cases doubling and tripling their Third Loan subscriptions. The large subscriptions of such firms as Ford, Dodge Brothers, Packard, Cadillac, Hudson, Lincoln, Continental, Fisher Body and others have contributed largely to the brilliant showing of Detroit, the first city in the United States with a population of over 100,000 to "go over the top" with an over-subscription of \$6,000,000. In some instances manufacturers who have been slow in either converting their plants or in following suggestions of the war industries board were not able to contribute as generously as might have been expected.

The Ford subscription to the Fourth Loan is 150 per cent greater than to the Third Loan. The Paige-Detroit Motor Car Co. increased its subscriptions by 100 per cent. At the Packard plant the average bond purchased per employee was \$90, as compared with \$67 for the Third Loan. The 1318 workers at the Motor Products Co. averaged more than \$100 per man, the total subscription being \$138,750. At the General Aluminum & Brass Co. 947 employees bought \$66,200 worth of bonds, or more than double what they had purchased in the Third Loan.

At the plant of Morgan & Wright, where 800 of the 3500 workers are girls, the latter subscribed an average of \$95 each. The total subscriptions by the workers was \$354,000, to which \$135,000 was added by the firm. The employees of the Timken-Detroit Axle Co. averaged \$103 worth of bonds per man. The Lewis Hall Iron Works subscribed two and one-half times as much as for the last loan.

The workers at the Holden Avenue plant of the Lincoln Motors Corp. made 100 per cent subscriptions, totaling \$128,350, or four times the Third Loan total. The Motor Products Corp. and employees subscribed \$238,000, as compared with \$102,400 for the Third Loan. Both company and employees doubled their former subscriptions.

#### Tabulation of Subscriptions to the Fourth Liberty Loan Campaign—Detroit District

Packard Motor Car Co.	\$1,000,000
Hudson Motor Car Co.	877,900
Maxwell-Chalmers Co.	300,000

Studebaker Corp.	250,000
Timken-Detroit Axle Co.	225,000
Detroit Steel Products Co.	100,000
Morgan & Wright	135,400
Michigan Lubricator Co.	27,000
Michigan Lubricator Co. employees	52,000
Northern Engineering Works	73,000

### Dupont Heads Flint Varnish

DETROIT, Oct. 23—W. W. Mountain, president and general manager of the Flint Varnish & Color Works has resigned as the company's chief executive officer and member of board of directors to become associated with John N. Willys. The board has also accepted the resignations of James E. Kepperly as vice-president and director, and B. A. Greene secretary and purchasing agent. The former is general manager of the Curtiss Aeroplane & Motor Co. of Buffalo. The latter will become affiliated with Dort Motor Co. Lamot Dupont, vice-president of the E. I. Dupont de Nemours company, was elected to the presidency to succeed Mountain. S. J. Sohlinger, who has been vice-president and assistant general manager for nearly 2 years was made general manager of the company and elected to the board of directors. F. M. Howard, treasurer, was also elected to the board.

### No Airplane Show Next Year

NEW YORK, Oct. 24—The Manufacturers Aircraft Association has abandoned plans for its annual show during the coming year. The directors last week adopted resolutions against such a show because of the necessity for devoting all time and energy to government requirements.

### Artillery Tractors in Production

WASHINGTON, Oct. 24—Five-ton and ten-ton artillery tractors are in quantity production of approximately 500 of each type per month, and the production is steadily increasing, according to announcement by Major General C. C. Williams, Chief of the Army Ordnance.

## Orders for 117,154 Vehicles

### Motors and Vehicles Section of Quartermaster Contracts Placed in Four Weeks

WASHINGTON, Oct. 24—During the past four weeks, the Motors and Vehicles Section of the Quartermaster Corps has placed contracts for various types of motor trucks, tractors, motorcycles, bicycles and passenger cars aggregating well in excess of \$130,000,000. A summary of the contracts shows that included in the total are 41,722 trucks and chassis, 3000 delivery cars, 9858 passenger cars, 18,755 motorcycles and 25,000 bicycles. It is stated there are all for the recently organized Motor Transport Corp.

The total of 41,722 trucks includes the order for 25,000 class B vehicles which was placed two weeks ago and also an order for 5000 Militors, 4000 of which are to be made by Packard. Also included are the 17,500 Nash, F. W. D., Pierce-Arrow and Garford trucks, contracts for which were placed last week. Although the Quartermaster Corps estimates the total value of the contracts at \$130,000,000 it seems likely that this figure is low and that it should be nearer to \$230,000,000. Following is a summary of the contracts:

800	3½-ton trucks
202	2-ton trucks
600	1½-ton trucks
600	5-ton chassis
1020	3½-ton chassis
6250	3-ton chassis
2100	2-ton chassis
565	1½-ton chassis
5000	Militor trucks
1200	Class AA chassis
24,500	Class B chassis
3584	10-ton trailers
150	4-wheel trailers
13,500	F. W. D. trucks
8000	Ford touring cars
1000	Dodge touring cars
300	Dodge winter cars
558	Limousines
3000	Delivery cars
18,775	Motorcycles
25,000	Bicycles

### Paige to Maintain Service

DETROIT, Oct. 21—In sections where Paige dealers are going to relinquish their agencies the company will endeavor to make arrangements with dealers of other cars to maintain Paige service in those territories.

### "Eagles" from Kearney Nov. 15

DETROIT, Oct. 16—Henry Ford's ship-building plant at Kearney, N. J., is progressing rapidly, and it is believed production of Eagles will start there Nov. 15.

# Automotive Industries □

## Car Output Holds Steady

### Average Weekly Production Maintained for Months Despite War Work

DETROIT, Oct. 22—Despite war work production of cars has been maintained at a steady level for some months past; the average weekly output has been about the same.

The Maxwell plant, which is engaged on a wide variety of war work, has been producing an average of 125 cars daily for several months. The production of Chalmers has been 30 a day since August. This plant is working on an order for armored artillery tractors and also on one for 5-ton artillery tractors in addition to working on motors, transmissions and clutches for tanks, two-horse reels, gun limbers and two sizes of shells. The company is also making airplane parts at Dayton.

Production at the Willys-Overland plant has been averaging 225 daily since September; Paige and Saxon, 25; Liberty, 5; King, 4; Columbia, 3; Dort, 25.

Saxon expects to build 1700 cars during the remainder of the year and now has 60 per cent of the most essential parts in stock. The company has started work on the Government order for Class AA trucks and will deliver 50 during November. Liberty, which also has an order for this type of trucks, will start production Nov. 1, and expects to deliver 30 the first month of production.

Work on gun carriages is progressing very rapidly. Up to date 70 have been made and 20 have been shipped. The initial shipment of five left the plant 2 weeks ago. In a few months the Toledo plant will be producing shells at the rate of 4000 a day.

Ford is getting ready for quantity production on its 15,000 order for 3-ton tanks.

Packard is preparing to start production of the 3-ton trucks, for which it received an order from the Government for 5250. It is believed when quantity output is reached the company will be making 600 to 700 a month. An order for 4000 Militar tractors has been received, and the company will be ready for production by the first of the year.

The Columbia Motor Car Co. has enough material on hand to build 300 cars this year. Within 30 days it will be in quantity production on the G. M. C. ½-ton truck order. The capacity of the plant is four or five trucks a day, but production will depend on the ability of General Motors to furnish axles.

In addition to making kitchen trailers for the Government, the King Motor Car Co. will continue to make repair parts for ambulances for the Marine Corps.

### Marine Engine War Service Committee

WASHINGTON, Oct. 23—A War Service Committee representing the marine internal combustion engine and accessory industries has been formed and consists of the following seven members: James Craig, James Craig Engine & Mach. Wks., Jersey City; Charles A. Criqui, Sterling Engine Co., Buffalo; Ora J. Mulford, Gray Motor Co., Detroit; Charles W. Pank, Fairbanks Morse & Co., Chicago; Eugene A. Riotte, Standard Motor Construction Co., Jersey City; J. A. Seymour, McIntosh & Seymour Corp., Auburn, N. Y.; Richard R. Young, Union Gas Engine Co., San Francisco. Mr. Riotte is chairman of the committee. One of the first duties of the committee will be the preparation of a questionnaire which will be filed by every marine engine builder in the country. The committee has established headquarters at 29 West 39th Street, New York.

### S. A. E. Section Meetings Abandoned

DETROIT, Oct. 23—The Spanish influenza epidemic has played havoc with the S. A. E. Section meetings. Buffalo, Indianapolis and Detroit Sections have all been compelled to postpone their meetings indefinitely.

### Wichita Motor Adds Tractor

WICHITA FALLS, TEX., Oct. 23—The Wichita Falls Motor Co., which for some time has produced motor trucks, is entering the field with a farm tractor. It is a four wheel machine with a four cylinder, vertical, 4½ x 6 valve-in-head engine with magneto ignition. It has two speeds forward and one reverse with drive through gears to the rear wheels and all driving mechanism operating in an oil bath. The weight is 4500 lb. and the drawbar pull 3000 lb. It will sell for \$2,000.

### Many Detroit Additions

DETROIT, Oct. 22—Among building permits granted this week in Detroit were the following:

Hudson Motor Car Co., one-story storage and repair building, 100 by 240 by 30, to cost \$45,000.

Clayton Lambert Mfg. Co., one-story water tank, 17 by 17 by 15, \$4,000.

Detroit Shell Co., addition to factory, to cost \$2,000.

Paige-Detroit Motor Car Co., \$1,000 addition to plant.

Maxwell Motor Co., addition to plant, to cost \$900.

## Canadian Merger of Four Companies

### General Motors Consolidated with McLaughlin and Chevrolet—Continue Branches

OSHAWA, ONT., Oct. 21—An amalgamation that will prove of far-reaching importance to the motor vehicle manufacturing industry has been effected by the consolidation of the McLaughlin Motor Car Co., the Chevrolet Motor Co. of Canada, Ltd., and the McLaughlin Carriage Co., Ltd., with the General Motors Co. The arrangement will be effective from Nov. 1.

One of the primary objects of the consolidation is the reduction of production costs. All the present plants, branch houses and distributing stations in Canada will be operated as heretofore and, in addition, engines which have formerly been imported will be manufactured in Canada, together with axles, transmissions and all other important parts.

With this end in view the General Motors Co. recently purchased a site in Walkerville, Ont., of 38 acres, where manufacturing operations will be conducted as soon as materials can be obtained and buildings erected. Provision will also be made from time to time to take care of the Canadian business of the Cadillac, Oldsmobile, Scripps-Booth, General Motors trucks and Samson tractor lines. All the plants in Canada will be operated to full capacity, it is stated, as soon as the raw material situation permits.

### Pool Allied Air Resources

WASHINGTON, Oct. 18—An agreement by which the aircraft resources of the United States and its Allies are to be developed under a joint program was the chief result of the trip of John D. Ryan, Second Assistant Secretary of War in charge of aircraft, to Europe with Secretary of War Newton D. Baker. Details of the plan, said Mr. Ryan on his return here, cannot be disclosed at this time.

In the operation of the planes in battle, he explained, Marshal Foch and the field commanders, Generals Pershing, Petain and Haig, will continue to control the air fleets as they do the other sections of the armies. In describing as much as could be told of the joint air program, Mr. Ryan told that each country will use its production resources and that the air forces of the three countries, France, United States and Great Britain, will be supplied out of this production on a pro rata basis.

# Adopt Specifications for Gasoline

## Standard Tests and Requirements Set for Truck and Airplane Fuels

WASHINGTON, Oct. 18—Following conferences between the Specifications Commission of the Allies and the American Committee on Standardization of Petroleum Products, standard specifications for motor and aviation gasoline have been adopted.

Under these specifications aviation gasoline has a far higher end point than commercial grades of fuel; motor gasoline, which is for the use of motor transport vehicles, is slightly different from the commercial grade. Ordinary commercial gasoline has an end point of approximately 450 deg. Fahr. Under the new specifications aviation gasoline has an end point of 347 deg. Fahr. for domestic purposes and 257 deg. Fahr. for the fighting grade, and motor gasoline of 420 deg. Fahr.

Following are the specifications as adopted by the Committee on Standardization of Petroleum Specifications:

### SPECIFICATIONS FOR MOTOR GASOLINE

**QUALITY:** Gasoline to be high grade, refined and free from water and all impurities, and shall have a vapor tension not greater than 10 lbs. per sq. in. at 100 deg. Fahr. temperature, same to be determined in accordance with the current "Rules and Regulations for the Transportation of Explosives and Other Dangerous Articles by Freight"—paragraph 1824 (k)—as issued by the Interstate Commerce Commission.

**INSPECTION AND TESTS:** *Inspection*—Before acceptance the gasoline will be inspected. Samples of each lot will be taken at random. These samples immediately after drawing will be retained in a clean, absolutely tight closed vessel and a sample for test taken from the mixture in this vessel directly into the test vessel.

*Test*—One hundred cubic centimeters will be taken as a test sample. The apparatus and method of conducting the distillation test shall be that described in Bureau of Mines Technical Paper No. 166, Motor Gasoline.

- Boiling point must not be higher than 140 degrees Fahr.
- 20 per cent of the sample must distill below 221 degrees Fahr.
- 45 per cent must distill below 275 degrees Fahr.
- 90 per cent must distill below 336 degrees Fahr.
- The end or dry point of distillation must not be higher than 428 degrees Fahr.
- Not less than 95 per cent of the liquid will be recovered from the distillation.

### SPECIFICATIONS FOR AVIATION GASOLINE

- COLOR:**—The color shall be water white.

*Test*—Inspection of a column in a standard 4-ounce oil-sample bottle.

- FOREIGN MATTER:**—The gasoline shall be free from Acid, undissolved Water and Suspended Matter.

*Acid Test:* The residue remaining in the flask after distillation is completed is shaken thoroughly with 1 cc. of distilled water. The aqueous extract must not be colored red on

addition of a few drops of methylochrome solution. *Water and Suspended Matter* would be in evidence in the test for color.

- DOCTOR TEST:**—The gasoline shall yield a negative doctor test.

Directions for making doctor test on gasoline:

(A) *Preparation of reagents:*—Sodium Plumbite or "doctor solution": Dissolve approximately 125 grams of Sodium Hydroxide (NaOH) in a liter of distilled water. Add 60 to 70 grams of litharge (PbO) and shake vigorously for 15 to 30 minutes, or let stand with occasional shaking for at least a day. Allow to settle and decant or siphon off the clear liquid. Filtration through a mat of asbestos may be employed if the solution does not settle clear. The solution should be kept in a bottle tightly stoppered with a cork.

Sulphur: Obtain pure flowers of sulphur.

(B) *Making of Test:*—Shake vigorously together two volumes of gasoline and one volume of the "doctor solution" (10 cc. of gasoline and 5 cc. of "doctor solution" in an ordinary test tube; or proportional quantities in a 4-ounce oil-sample bottle may conveniently be used). After shaking for about 15 seconds, a small pinch of flowers of sulphur should be added and the tube again shaken for 15 seconds and allowed to settle. The quantity of sulphur used should be such that practically all of the sulphur floats on the surface separating the gasoline from the "doctor solution."

(C) *Interpretation of Results:*—If the gasoline is discolored, or if the sulphur film is so dark that its yellow color is noticeably masked, the test shall be reported as Positive and the gasoline condemned as "sour." If the liquid remains unchanged in color and if the sulphur film is bright yellow or only slightly discolored with gray or flecked with black the test shall be reported Negative and the gasoline considered "sweet."

**4. CORROSION AND GUMMING TEST:**—The gasoline when subjected to the corrosion test shall show no gray or black corrosion and no weighable amount of gum.

*Directions for Making Test:*—The apparatus used in this test consists of a freshly-polished hemispherical dish of spun copper, approximately 3½ in. in diameter.

Fill this dish to within ¼ in. of the top with the gasoline to be examined and place the dish upon a steam bath. Leave the dish on the steam bath until all volatile portions have disappeared.

If the gasoline contains any dissolved elementary sulphur, the bottom of the dish will be colored gray or black.

If the gasoline contains undesirable gum-forming constituents, there will be a weighable amount of gum deposited on the dish.

Acid residues will show as gum in this test.

*Interpretation of Results:*—**CORROSIONS:** It is specified that no gray or black deposit shall be formed. This wording is intended to admit gasolines that have so small a quantity of sulphur that the deposit is peacock colored.

**GUM:** It is specified that there shall be no weighable amount of gum. The intention is to refuse admittance to gasolines that show an amount that can be readily weighed in this style of dish.

The distillation method and apparatus shall conform to those outlined and described in Bureau of Mines Technical Paper No. 166, entitled "Motor Gasoline, Properties, Laboratory Methods of Testing and Practical Specifications."

### VOLATILITY AND DISTILLATION RANGE—EXPORT GRADE:

When 5 per cent of the sample has been recovered in the graduated receiver the thermometer shall not read more than 149 degrees Fahr. or less than 122 degrees Fahr.

When 50 per cent has been recovered in

the receiver the thermometer shall not read more than 203 degrees Fahr.

When 90 per cent has been recovered in the receiver the thermometer shall not read more than 257 degrees Fahr.

When 96 per cent has been recovered in the receiver the thermometer shall not read more than 302 degrees Fahr. and the end point shall not exceed this temperature by more than 27 degrees Fahr.

At least 96 per cent must be recovered in the receiver from the distillation.

The Distillation Loss shall not exceed 2 per cent when the residue in the flask is cooled and added to the distillate in the receiver.

### VOLATILITY AND DISTILLATION RANGE—FIGHTING GRADE:

When 5 per cent of the sample has been recovered in the graduated receiver the thermometer shall not read more than 158 degrees Fahr. or less than 140 degrees Fahr.

When 50 per cent has been recovered in the receiver the thermometer shall not read more than 203 degrees Fahr.

When 90 per cent has been recovered in the receiver the thermometer shall not read more than 235 degrees Fahr.

When 96 per cent has been recovered in the receiver the thermometer shall not read more than 257 degrees Fahr. and the end point shall not exceed this temperature by more than 27 degrees Fahr.

At least 96 per cent must be recovered in the receiver from the distillation.

The distillation loss shall not exceed 2 per cent when the residue in the flask is cooled and added to the distillate in the receiver.

The United States War Department requires the Fighting Grade to be colored Red after inspection and acceptance.

### VOLATILITY AND DISTILLATION RANGE—DOMESTIC GRADE:

When 5 per cent of the sample has been recovered in the graduated receiver the thermometer shall not read more than 167 degrees Fahr. or less than 122 degrees Fahr.

When 50 per cent has been recovered in the receiver the thermometer shall not read more than 221 degrees Fahr.

When 90 per cent has been recovered in the receiver the thermometer shall not read more than 311 degrees Fahr.

When 96 per cent has been recovered in the receiver the thermometer shall not read more than 347 degrees Fahr.

At least 96 per cent must be recovered in the receiver from the distillation.

The distillation loss shall not exceed 2 per cent when the residue in the flask is cooled and added to the distillate in the receiver.

### Canada Admits Tractor Radiators

OTTAWA, ONT., Oct. 19—Radiators imported with tractor attachments and furnished only to supply sufficient cooling when the attachments are placed on an automobile, may be admitted without duty under the terms of the order-in-council contained in Memo. 2166B.

### Overland Exports Handled from New York

TOLEDO, Oct. 18—Headquarters for export of the Willys-Overland Co. are to be removed to New York in anticipation of the greatly expanded business in prospect both now and after the war. R. T. Williams, export manager, will remove to the new location, while E. C. Morse, who has been handling Willys-Overland affairs at Washington, will also make his headquarters in New York.

## Navy Uses Libertys Exclusively

Now Has 900 Seaplanes So Equipped in Service—Whole Atlantic Coast Patrolled

WASHINGTON, Oct. 18—Using the Liberty engine almost exclusively and having received more than 1500 of them, the U. S. Navy has now over 500 seaplanes in service abroad and more than 400 seaplanes in service in this country, according to a statement made in Congress this week by Congressman Padgett.

Beginning the war, said the Congressman, with one air station at Pensacola, Fla., and with 30 officers and 300 enlisted men, the flying service has increased and now comprises stations in France, England, Ireland, Canada and all along the Atlantic coast, using 40,383 officers and men, of whom 16,621 are actively engaged in operations against the enemy. Schools for training aviators have been established in the Central West and near the Pacific coast. For training dirigible pilots a school was established in Ohio and another will soon be constructed elsewhere.

Practically the entire Atlantic coast, stated the Congressman, is now patrolled by American seaplanes and several cases have been reported of enemy submarines sunk by our flying boats.

During the month of September, 1918, aircraft of the U. S. Navy engaged in patrol flights covered 404,775 miles and at the same time training flying boats traveled 1,317,460 miles. Actual figures of the work abroad are withheld, as it is considered most wise to keep this from the public for the present.

On April 27, 1918, an American dirigible abroad made a continuous flight for 25 hr. and 43 min., during the course of which three convoys were escorted for 13 hr. and 50 min. in a zone mined and patrolled. The French Government praised this feat highly.

The Navy flying forces have also been exceedingly active in destroying enemy submarine and naval bases, and since Aug. 15 have been engaged steadily in bombing enemy bases in Belgium.

When war was declared, says the statement, 93 heavier-than-air seaplanes had been previously delivered to the Navy and 135 were on order. Of the 93, only 21 were in use, the remainder having been worn out or lost. These seaplanes were of the N-9 and R-6 types, now used solely as training planes.

After eliminating types tried and found unsuited, the Department fixed on two sizes as standard and adopted the Liberty engine for the entire program. Owing, however, to some little delay 700 other engines were purchased.

### New Commission Plan

WASHINGTON, Oct. 21—Applications for commissions in the Motor Transport Corps, Division of Military Aeronautics,

Bureau of Aircraft Production or other divisions of the Army, will hereafter be handled directly by the Military Training Camps Association offices as established throughout the country. Applications sent directly to any Army corps will be referred to the association. Journeys to Washington for commissions will be useless, as the applicant will in turn be referred to the association office nearest his home.

The proper procedure for securing a commission, states the new order containing the above rules, is for an applicant to watch the press until the division he is interested in is reported to require officers, and then he may file his application, applying to the nearest association office, where he will be given complete information and later examined and interviewed. Men who are particularly qualified for some special service in the Army and who desire commissions may make application in advance of any definite statement of a need for such officers. Following is a list of the offices of the Military Training Camps Association to which applicants for commissions can apply:

New York	.....19 W. Forty-fourth St.
Boston	.....Room 330, 84 State St.
Philadelphia	.....117 Commercial Trust Bldg.
Atlanta, Ga.	.....78 S. Pryor St.
Chicago	.....Consumers Bldg.
Cleveland	.....37 Wade Bldg.
St. Paul, Minn.	.....1013 Pioneer Bldg.
Dallas, Tex.	.....420 Interurban Bldg.
Kansas City, Mo.	.....New England National Bank Bldg.
Portland, Ore.	.....Corbett Bldg.
San Francisco	.....1020 Mills Bldg.
Los Angeles	.....Van Nuys Bldg., 210 W. Seventh St.
Washington, D. C.	.....War Service Exchange, State War and Navy Bldg.

### Bids on Chains Sought

WASHINGTON, Oct. 21—The Post-office Department requests bids on non-skid chains to be used on 36 x 6 pneumatic tires, in lots of 10 pairs or sets or in lots of 25 pairs or sets. Bids are also invited on cross chains for these, and bids will be considered on other non-skid devices to fit these size tires. Bids will be received up to 2 o'clock Nov. 4. Bidders are required to submit samples and descriptions of any device other than "Weed" chains. Prices are to include delivery to any postoffice operating Government-owned trucks, and are also to be quoted as f.o.b. factory. The price bid can also be stated as for one pair of chains instead of in lots as above. Bidders should specify if the prices quoted will hold good for the balance of the present fiscal year or the period of time they will remain in effect.

### Plenty of Chrome Ore

WASHINGTON, Oct. 18—The chrome ore supply in the United States is sufficient, the situation is in hand and additional investments for production are not necessary for the present, according to the War Industries Board. This has come about because the consumption of chrome has been reduced by alterations in the war program and through the production of largely increased supplies of chrome in the United States.

## Demand in Australia Excellent

Lack of European Cars Creates Boom for American Products —Roads are Good

MELBOURNE, AUSTRALIA, Aug. 22 —The demand for automobiles in this part of Australia continues far in advance of the supply. The entire lack of European cars during the past 3 years has created a boon for American cars but the majority of these fit tires far too small for the kind of country the car must be operated in here.

While the farm tractor is practically unknown in this part of Australia there is a wonderful opportunity for some type that will not become bogged in soft ground. This is a country where huge tracts of land are cultivated, quite a large number of agriculturists harvesting 3000 acres annually. In such areas a light tractor that can be put to a great many jobs will have a very great sale. At present farm tractors are being experimented with in some of the highlands in the Straits Settlements on plantation work but little development work has been done in Australia.

The motor truck was not taken in the manner it should have, as many of our merchants experimented with trucks with rather unsatisfactory results. This was very largely due to lack of good mechanics and the sentiment is gaining ground that the most efficient method of operating trucks is to own a fleet and have a first class mechanic to look after them.

Roads within a 10-mile radius of Melbourne are good and well suited for truck work. Further in the country districts during the winter months the roads are of little use.

At present everybody in Australia appears to be prosperous, which should be the case, as Australia is one of the largest producers of food stuffs, wool and meats. As soon as the war is over and shipments of cars from America are permitted there will be a big movement in the industry.

### Propose Washington S. A. E. Section

WASHINGTON, Oct. 18—Consideration is being given the possibility of forming a Washington section of the Society of Automotive Engineers. In all probability final action will be taken at the meeting to be held Nov. 6. There are at present about 200 members of the society whose work keeps them continually in Washington.

### Investigate Foreign Coal Situation

WASHINGTON, Oct. 23—The U. S. Fuel Administration has appointed a special commission to inquire into conditions and Government regulations affecting the coal industry in foreign countries. The commission will consist of Walter E. Hope, S. Brinckerhoff Thorne and James H. Allport. They will sail soon for Europe.

## No More Gasless Sundays

Seven of Them Saved 1,000,000 Gal.—Priorities for Overseas Shipments

WASHINGTON, Oct. 19—The Fuel Administration has withdrawn its request for gasless Sundays, but the need for conservation still exists and in only a slightly lessened degree. So far, no other plan to take the place of gasless Sundays has been perfected, though plans are being made and it is expected that a substitute measure will be submitted very soon. It is likely that this will take the form of a voluntary pledge from motorists.

When the first gasless Sunday was inaugurated, Sept. 1, the idea was to conserve stocks of gasoline east of the Mississippi so that there might always be a sufficient supply on the Atlantic seaboard to insure prompt and plentiful shipments overseas. Now, however, the Fuel Administration has adopted another means of insuring the overseas supply and effective at once will issue priority orders for gasoline to go abroad to our fighting forces. In other words, overseas demands get first call on the supply available.

The seven gasless Sundays saved approximately 1,000,000 gal. of gasoline. No exact figures have been compiled. The Fuel Administration is working on such figures now and expects they will be ready about Nov. 1. The conservation measure has not materially affected the stocks of gasoline east of the Mississippi. Following are the figures:

STOCKS OF GASOLINE ON HAND			
September 16		October 14	
Motor Bbl.	Aviation Bbl.	Motor Bbl.	Aviation Bbl.
2,949,640	340,883	3,134,731	166,369

These figures represent the entire

gasoline reserve east of California and is not all available for export, as it is stored in territory as far west as Wyoming and includes all interior storage in the various oil producing localities.

The peak load of domestic consumption has now been passed and it is hoped that the new priority regulations for overseas shipments combined with a new conservation plan will make it possible to fill all requirements.

As a further measure to conserve gasoline, Chairman Bernard M. Baruch of the War Industries Board has ordered that the manufacture of all gasoline stoves be discontinued for the present.

It is pretty definitely established that motorists will be asked to restrict the use of gasoline by approximately 20 per cent. This will be done by a voluntary pledge system and it is likely that cards or coupon books for rationing fuel will be adopted.

One such system at present under consideration contemplates the issuance of coupon books with coupons of various colors for the different months. Such coupons would vary in value in proportion to the quality of gasoline produced and the quantity used.

For example, a blue coupon for October might be given a value that would permit the holder to purchase two gallons of gasoline on that coupon in October. If stocks of gasoline were considerably depleted in October, leaving not a great amount for November, the yellow or pink or green November coupon might have a value of only one gallon of gasoline. Similarly, the orange coupon for January might have a value of three gallons of gasoline if production and stocks on hand were sufficient to warrant motorists using gasoline in such quantities.

Such a plan is favored because of its elasticity. It would permit the government authorities to ration gasoline in exact proportion to production and consumption.

Another idea of the manner in which the conservation program may be arranged is indicated by a plan of the Division of Transportation of the Governmental Emergency Commission. Under this war workers in the city of Washington are to be carried to their work by private cars. War workers may halt any car not already filled going in the direction of their work between 7 and 9.30 a. m. and returning home from 4.30 to 6.30 p. m. It is

## Oil Production Down Slightly

Gasoline Output, Too, Falls Off—First Eight Months Ahead of Last Year

	PRODUCTION	
	August, 1918	July, 1918
	28,534,275	29,170,718
Crude oil (bbl.)	330,335,046	332,022,095
Gasoline (gal.)	Stocks on Hand	
	Aug. 31, 1918	July 31, 1918
Crude oil (bbl.)	13,946,595	14,026,525
Oils purchased to be re-run (bbl.)	1,082,892	1,548,971
Gasoline (gal.)	285,446,538	349,928,604
Kerosene (gal.)	424,281,481	432,807,129
Gas and fuel (gal.)	569,016,413	519,012,839
Lube. (gal.)	137,496,986	136,460,207
Wax (lb.)	176,197,680	176,539,564
Coke (ton)	19,912	17,943
Asphalt (ton)	88,446	92,597
Miscellaneous (gal.)	459,891,496	450,086,589

NEW YORK, Oct. 23—The production of both gasoline and crude oil dropped slightly during August as compared with July; but the total production for the first 8 months of 1918 is considerably ahead of the first 8 months of 1917. Stocks of both gasoline and oil have decreased slightly.

During August the daily average production of gasoline was 10,655,969 gal., as against 10,710,390 in July, which is a loss of 54,421 gal. Stocks of gasoline on hand as of Aug. 31 are 64,482,066 gal. less than the quantity on hand July 31. During July the production of crude oil fell off 636,443 bbl., the output for August being 28,534,275 bbl. as compared with 29,170,718 bbl. for July. Stocks of oil on hand decreased 1,079,930 bbl. during the month.

The gain in the production of oil and gasoline during the first 8 months is a substantial one. The output of crude

felt that the action of this committee may have considerable influence in having similar suggestions adopted in other cities where considerable numbers of cars continually carry but one or two passengers.

### Total Output of Refineries in U. S. for First Eight Months of 1917

	Crude (bbl.)	Other Oils (bbl.)	Gasoline (gallons)	Kerosene (gallons)	Gas and Fuel (gallons)	Lubricating (gallons)	Wax (pounds)	Coke (tons)	Asphaltum (tons)	Miscellaneous (gallons)	Losses (bbls.)

was 5,494,578 bbl. greater in the last 8 months than in the same period last year. And the gain in gasoline production for the period was 527,964,789 gal. The stock of kerosene on hand decreased slightly, but the stock of fuel oil increased by approximately 50,000,000 gal. There was also a slight increase in stock of lubricating oil.

On page 730 is a table of the total output of refineries in the United States for the first eight months of 1917 and 1918.

#### French Delco Company

PARIS, Oct. 4—A French Delco company has just been formed here, with exclusive rights from the Dayton concern, to manufacture electric lighting and starting apparatus in France and in French colonies. The company, which is known as the Société Française des Appareils Delco, has the following prominent men on its board of directors: Clement-Bayard, Tomine, Ballot, Barbaroux, Continsouza, Nicaise, Patin and Repusseau. Mr. Clement-Bayard is the president of the automobile company bearing his name; Mr. Tomine was business manager for the Delage company prior to the war; Ballot is the biggest motor specialist in France; Mr. Barbaroux is chief engineer of the Lorraine-Dietrich company, after having been at the head of the Delaunay-Belleville company for many years; Mr. Nicaise is president of the same company; Mr. Repusseau is a body builder and Buick agent in France.

#### U. S. Rubber Sells \$6,000,000 Notes

NEW YORK, Oct. 23—For the purpose of paying off in part \$9,000,000 of 5 per cent debenture bonds of the General Rubber Co., the U. S. Rubber Co. has sold \$6,000,000 7 per cent five-year secured notes to Kuhn, Loeb & Co., New York. The General Rubber Co. is a subsidiary of the U. S. company. The remainder of the maturing General bonds will be paid off in cash.

#### Liberty Engine Output 150 Daily

DETROIT, Oct. 21—Liberty engine production is steadily increasing and each of the five representative manufacturers in this district is running far ahead of the quota up to date. The total output of all the plants averages 150 engines a day. The present daily production of the individual plants is as follows: Ford, 42; Buick, 20; Nordyke & Marmon, 10; Packard, 35; Lincoln, 35.

## Costs and Speed in Tractor Tests

### Eight Tractors Plow Heavy Soil at Hempstead—Ravine Worries Operators at First

HEMPSTEAD, L. I., Oct. 19—Eight tractors participated in a demonstration held on a field just outside of this town this afternoon. The event was held under the auspices of the Nassau County Farm Bureau and the fuel consumption was recorded by the Bureau of Weights and Measures.

The tractors each plowed a plot 4 rods wide and 40 rods long, making 1 acre, and disked the ground afterward. Fuel consumption was taken for the plowing only. The ground was damp prairie sod that was very sticky and not easy to turn up, yet the tractors did themselves credit both in the time consumed and the amount of fuel used. A ravine that averaged 3 to 4 ft. in depth crossed the line of the furrows and added considerably to the difficulty of plowing, as gears had to be changed in nearly every case as the banks of the ravine were quite steep.

Observers accompanied the tractors and made records of stops and kept tabs on the furrow depth. The performance of the machines was not marred by any more serious difficulties than a couple of dropped plow parts and the failure of several of the plows to scour in the sticky soil.

The cause of the failure to scour was carelessness in allowing the shares to get rusted. The operators deemed it sufficient to polish them off with emery cloth, whereas they should have been put through sandy soil for at least 4 hr. before being put in sticky soil.

One of the features of the demonstration was the driving of the Maxim tractor by Katherine Freeman from the New York State School of Agriculture. She had come to witness the event and was invited to drive the tractor, which she did in a most creditable manner, making the turns at the headlands and operating the plows herself.

#### May Move Government Departments

WASHINGTON, Oct. 23—There has been some little agitation of late for the removal of certain government departments and bureaus from Washington to other less congested and more central

locations. The heads of several departments have been asked to submit opinions on the subject, these departments including food, fuel, war industries, war trade and war risk. There has also been some talk of the Aircraft Production Board removing lock, stock and barrel to New York.

#### Trade Commission Halts Unfair Methods

WASHINGTON, Oct. 24—The Federal Trade Commission has ordered the Wayne Oil Tank and Pump Co. of Fort Wayne to discontinue unfair trade practices admitted by the concern, including misrepresentation to customers, price-discrimination, and efforts to discredit and hamper competitors. The commission's order was issued in agreement with the concern which waived right to introduce testimony in support of its practices.

#### Specialists in Foreign Advertising Open New York Office

NEW YORK, Oct. 21—The J. Roland Kay Co., Chicago, handling the foreign advertising of a number of firms, including the Willys-Overland Co., the U. S. Rubber Co. and the Remington Arms U.M.C. Co., has opened a New York office at 18 East Forty-first Street. The company also has offices at London, England; Tokyo, Japan; Sydney, Australia; Capetown, South Africa, and Buenos Aires, Argentina.

#### International Harvester Suit Dismissed

WASHINGTON, Oct. 23—The anti-trust suit brought against the International Harvester Co. has been dismissed. This is in accordance with arrangements made for the dissolution of the company approved by the Department of Justice.

#### Trego Has Small Fire

NEW HAVEN, Oct. 23—The Trego Motors Corp. was visited by a small fire last week. A frame building was burned and no great damage done. Production will be delayed slightly for a few days.

#### Production Not Affected by Influenza

DETROIT, Oct. 21—As a result of an investigation made by the regional industrial commission of Michigan at the request of the Government it was found that the production of war work has hardly been affected on account of the epidemic of Spanish influenza. Output has fallen off only slightly less than 1 per cent and in the Jackson and Lansing district a trifle less than 5 per cent. It is reported this is very favorable compared to other states.

#### American Steel Tube Doubles Capital

TOLEDO, Oct. 22—The American Steel Tube Co. has increased its capital stock from \$50,000 to \$100,000. The company has contracts to furnish several million steel tubes to the Government, and recently doubled its output by purchasing the old Landers Brothers Co. plant, Buckeye Street and the Terminal Railway.

### Results of Hempstead Tractor Demonstration

## Airplane Observers Needed

### U. S. Air Service Opened to Civilians and Men in the Ranks—3 Months' Training

WASHINGTON, Oct. 18—The United States Air Service is urgently in need of observers. The service has been thrown open for the induction of draftees, registrants and civilians, and an opportunity is given men in the ranks to become connected with this service.

The call for war observers has come directly from General Pershing and has been emphasized by Major General Kenly. Pilots and observers are trained in reserve brigades and sent overseas in squadrons as rapidly as possible, fully organized and equipped. The first reserve brigade, which is to consist of 36 squadrons, is located on Long Island on 9 different flying fields. The second reserve brigade, consisting of 4 squadrons, is located at Park Place, Tex. The third will probably be located in New Jersey or in some other district within close proximity to the Atlantic Coast.

The number to be trained in these brigades, however, will be inadequate in view of the greatly increased activities of the American air force, and it is for this reason that civilians and men in the ranks are urged to get into this service.

It is pointed out by the Division of Military Aeronautics that the training of an observer requires 3 months, when the candidate is immediately commissioned a second lieutenant and sent overseas. The training of a pilot, on the other hand, requires 8 months, with the ultimate result of the same grade of commission. Observers are required to pass the same physical tests as pilots and must have certain flying training to enable them to bring down a plane in the event the pilot is injured.

Striking evidence of the importance of airplane observers is given by the fact that in the Continental armies these men invariably are recruited from line officers of experience and are always commissioned, whereas pilots very frequently are not commissioned. The best pilots are men who have qualified first as observers.

At present there is a shortage of advanced training planes, and this is tending to hold back the training of pilots. There are plenty of primary training planes. The situation with regard to advanced training planes is improving.

Civilians or men in the ranks who desire to enter the air service should apply to any recruiting board or examining board for training as observers in the Division of Military Aeronautics.

### U. S. Motor Vehicles Not Subject to License Tax

WASHINGTON, Oct. 21—Motor vehicles owned by the Government or operated exclusively for official purposes do

not require licenses from states, territories or municipalities, according to a ruling issued by the Engineers Corps, United States Army. The use of public funds for the purchase of such licenses is prohibited. If local authorities are willing to issue the various tags or plates without charge and for the convenience of Government-owned vehicles, they can be accepted and used.

Instructions to army officers, issued with the ruling, call for the use of metal plates on Government-owned vehicles stating the name of the department owning and operating the machine, together with the department number for that particular car, truck or motorcycle. These signs are to be 7 in. high and 12 in. wide and to conform generally with the regulations of the community in which they are used. The commanding officer for the Army in that district is ordered to notify the civil authorities of the kind and numbers of machines which it is expected the Army will operate. Rules demand that the Army drivers obey all speed and other regulations, and if stopped while on official business by civil authorities because of failure to carry a license tag the drivers are ordered to give full information regarding the ownership and use of the machine.

These rules do not apply to machines owned privately by Army officers who must in all cases abide strictly by the law and regulations as established by the civil authorities. And the use of any metal signs on vehicles reading U. S. A. or U. S. Army is prohibited.

### Form Munitions Patent Board

WASHINGTON, Oct. 18—A Munitions Patent Board has been formed for the purpose of co-ordinating the policies of the War and Navy Departments in patent matters. The membership will consist of Thomas Ewing, Max Thelen, representing the War Department, and Pickens Neagle, representing the Navy Department. The board has been formed for the following purposes:

1—To consider clauses in contracts of the respective departments dealing with patents.

2—Questions as to the validity or infringement of patents and the patentability of inventions.

3—Questions as to the amount of compensation to be paid for patents or for their use.

The board is empowered to recommend suitable actions or policies in regard to all patent matters brought before it for consideration.

### Coal Production Maintained

WASHINGTON, Oct. 18—Bituminous coal production for the week ending Oct. 5 was 12,585,000 tons, an increase of 1,774,000 tons over the corresponding week of 1917, and a decrease of 462,000 tons as compared with the week ended Sept. 28, which was the second highest week in coal history. Anthracite coal production amounted to 2,052,000 tons for the week ending Oct. 5; the same tonnage was produced in the corresponding week of 1917.

## Truck Repair Depots in 6 Cities

### Country Divided Into Sections for Motor Transport Maintenance Operations

WASHINGTON, Oct. 21—There will be six great repair bases for army motor trucks in the United States. These are to be located at Camp Holabird, Baltimore, Md.; Atlanta, Ga.; Fort Sam Houston, Tex.; El Paso, Tex.; Chicago, Ill.; San Francisco, Cal. The most important one is that at Camp Holabird, because it serves the largest district and the one that contains nearly all the important truck factories and all the principal ports of embarkation for France. The states in this district are: Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, West Virginia, Virginia, Kentucky, Ohio, Indiana, Michigan (lower peninsular) and the District of Columbia.

New machines only are sent to the American Expeditionary Forces, but, in order that the steady flow of them may be maintained at a maximum, the old trucks that serve the army's needs here must be kept in service as long as the repairman's skill can make it possible. The new district system will greatly facilitate repairs and reconstruction, and it will be the policy of the Motor Transport Corps to discourage major repairs at any points other than the central units.

### Officers Assigned to Each District

Each district is to be commanded by a District Motor Transport Officer, to be appointed by the chief of the corps, and who will have, under the authority of the chief, control and supervision of all matters pertaining to the operations, maintenance and repair of all Class 1 vehicles and a technical supervision of all Class 2 vehicles. Class 2 vehicles are those assigned to various units outside of the Motor Transport Corps, according to the Tables of Organization. The Motor Transport Corps is responsible for the repair and maintenance of these vehicles. Class 1 consists of all vehicles operated directly by the corps.

Under the latter heading come the new trucks that are moved from the factories to the seaboard in convoy. Not only do these vehicles relieve the railroads by moving, under their own power, but they help out by taking, each, a load of government freight. Thousands of tons of freight are being moved in this way all the time. The officers and men who handle these convoys are mostly recent graduates of the corps training schools, who are sent out to complete their training by practical road work, done under the same rules that apply to the American Expeditionary Forces and with conditions duplicated as nearly as possible. Men are drawn largely from the motor trades, although mechanics of

other lines may be inducted into the service. Material for officers must combine motor or mechanical knowledge with executive ability. Both officers and enlisted men are sent overseas soon after completing their training.

#### Canada Adopting Rural Express

TORONTO, Ont., Oct. 19—Rural motor express and freight lines are likely to become a prominent feature of rural life in Canada in the near future. Already one Canadian company, with headquarters in Toronto, has established such a line, and has a fleet of twenty-five motor trucks in operation. No doubt this is merely the precursor of many similar lines throughout eastern Canada. With the railways devoted almost entirely to the winning of the war and the consequent preference given to the haulage of war materials and fuel for the munition factories and the transportation of the finished products to the seaports, the small shipper is subjected to unusual hardships to get his product to the purchaser, and this is particularly true where but comparatively short hauls are required.

#### Investigating Parts Stocks

BOSTON, Oct. 19—John H. Johnson, a director of the N. A. D. A., returned from Washington yesterday, where he was in conference with other officers of the organization and also with some of the members of the War Industries Board relative to the work of conservation being carried on in the New England territory.

He reported that a committee had been formed of accessory men to secure information for the board on the amount of stock that the dealers had on hand at the present time. He told the men he talked to that he found the accessory men willing to co-operate in every way with the officials at Washington, and that within a short time it would be possible to let them know where Boston stood in the way of supplies.

#### Government Wants Boston Buildings

BOSTON, Oct. 19—A number of the big motor dealers in Boston have been asked by the Federal Government to submit bids for leasing their buildings to the Navy Department to house the sailors who are being trained in the Boston Naval District.

The request came as a surprise and found the dealers unprepared to make a quick response. The section proposed to be taken over by the Government comprises the buildings on Commonwealth Avenue from Lawton Street to the Jewish Temple.

The Government asked bids for eight months' occupancy, with a privilege of another year if needed.

The offers have been taken to Washington by a naval officer, and the department there will pass upon them. If the plan goes through that part of motor row on Commonwealth Avenue will be wiped out for the present, and some of the dealers think they may not go back again.

## Trucks Important at Chateau-Thierry

### In 3 Hours 580 Trucks Were Put in Condition to Help the Americans Beat the Hun

WASHINGTON, Oct. 18—Motor trucks played a vital part at Chateau-Thierry. When the Germans were rushing toward Paris in June there was an overhaul park south of Chateau-Thierry where disabled cars and trucks were sent for repairs. The park employed 1500 soldiers. It was filled with trucks at this particular time, trucks wrecked and shell smashed, others jolted beyond usefulness by driving over the shell-torn roads. On July 8, when the situation at the front was particularly bad and the French needed aid, General Foch ordered the Americans into the lines. They were needed quickly. The overhaul park was ordered to have every truck ready for service in 3 hours.

There were 610 trucks in the park, many of them fully repaired, a large number on which work had not yet started, others in process of repair. The commandant ordered every man at work. Officers donned overalls and joined with the privates. Only the essential parts were repaired, those that would carry the trucks over the roads. At the end of the 3 hours 580 trucks were in condition and ready to move.

#### Officers Volunteer as Drivers

With a shortage of drivers volunteers were called for. Many of the officers seized the opportunity to get to the front, although this was the usual work of corporals. They got the chance and together with the master mechanics and other skilled men with the grades of sergeants, whose usual duties kept them at the park, rolled out to their assigned destinations with an array of captains and lieutenants on the drivers' seats such as has never before been seen during the war.

A 3-ton truck usually carries 25 men with their packs. The 580 trucks had a capacity of 14,500 men. When troops move under normal conditions seats are put into the trucks and the speed is limited by the governors to 14 m.p.h. These trucks had no seats. The troops stood. The governors were taken off. The vehicles hit a 25 mile gait toward the front firing lines.

This event, stated a returned officer, was one of the many that served to emphasize the fact that armies cannot make sweeping advances without motor-propelled vehicles. It is only recently, despite earlier proof of this, that systematic use of huge numbers of motor trucks has been engaged in the moving of large bodies of troops. General Foch and General Pershing have recognized the importance of motor trucks in conjunction with their general ability of moving troops rapidly. They have, it was stated, realized the mobility that results from the use of motor trucks. They are moving whole divisions across wide

areas, infantry, artillery and airmen, by motor trucks.

#### Ask Dealers for Parts Inventories

BOSTON, Oct. 19—Some Boston dealers have been asked by factories to send in a complete inventory of what they have in the way of parts. The intimation is that some of these parts may be requisitioned to complete cars that are nearly all assembled but for which various things like axles or springs may be shy.

#### Merge Defense and Labor Sections

WASHINGTON, Oct. 18—The Section on Industrial Training for the War Emergency, Committee on Labor, Council of National Defense, which is under H. E. Miles, chairman, has been merged with the Training and Dilution Service of the United States Department of Labor, which is under C. T. Clayton. Under the merger Mr. Clayton will become the director and Mr. Miles the chief of training.

Employers interested in the training and dilution of workers, in the installation of training vestibules in factories, in factory organization and so forth, can secure much valuable information through the Training and Dilution Service, Department of Labor, to which communications can be addressed.

Heretofore the section under Mr. Miles working through the Council of National Defense has done valuable work in inaugurating vestibule schools, as has been testified to by numerous employers who by this means have overcome their labor problems. Mr. Clayton's department, an enlargement upon that of Mr. Miles, will be ready to extend similar aid to employers, according to Mr. Clayton.

#### Further Curtail Road Machinery

WASHINGTON, Oct. 19—Road making machinery has been further curtailed in manufacture for the 6 months following Oct. 1, 1918, by the War Industries Board, and is limited to the manufacture of 15 per cent of six-twelfths of 1917 production for civilian uses, but in no event to exceed, with the total production, 5 per cent of six-twelfths of the 1917 tonnage. This means that not more than 15 per cent of the road machinery made in the half of 1917 can be devoted to civilian uses, while in no event can road machinery manufacturers produce more than 50 per cent of 6 months' 1917 production for all purposes, including civilian, army, municipal, state or township uses.

#### Chicago-St. Louis Barge Service

ST. LOUIS, Oct. 18—It has been announced officially here that a dependable barge service between this city and Chicago will open soon. The freight rates will be about 80 per cent of the railroad rate and the bill of lading will be as useful as commercial paper. The service will be under direction of the Government, and will be through the Illinois and Michigan Canal, the Illinois River and the Mississippi.

# Increased Storage of Coal

All Consumers Except Those in Class I Get More—Move Up One Class

WASHINGTON, Oct. 18—The United States Fuel Administration has authorized slightly increased coal storage for all classes of consumers except those in Class 1. Consumers not on the Preference List are authorized to lay in additional reserve supplies and consumers in Class 2 may store coal up to the limits now imposed on Class 1. Consumers in Classes 3 and 4 have both been moved up one class. Following are the regulations:

## Consumers in Classes 1 and 2.

Maine, 135 days.  
Massachusetts, Vermont, New Hampshire, Northern New York, 105 days.  
Connecticut, Rhode Island, Southwestern New York, 90 days.  
Southeastern New York and New Jersey, 60 days.  
Delaware, East Pennsylvania, Maryland, District of Columbia, Virginia, North Carolina, South Carolina, Georgia, Florida and Western Ohio, 35 days.  
Western Pennsylvania, West Virginia, Eastern Kentucky, Eastern Ohio, 35 days.  
Lower Michigan, 90 days.

## Consumers in Class 3.

Maine, 120 days.  
Massachusetts, Vermont, New Hampshire, Northern New York, 90 days.  
Connecticut, Rhode Island, Southwestern New York, 75 days.  
Southeastern New York and New Jersey, 50 days.  
Delaware, Eastern Pennsylvania, Maryland, District of Columbia, Virginia, North Carolina, South Carolina, Georgia, Florida, Western Ohio, 40 days.  
Western Pennsylvania, West Virginia, Eastern Kentucky and Eastern Ohio, 30 days.  
Lower Michigan, 75 days.

## Consumers in Class 4

Maine, 105 days.  
Massachusetts, Vermont, New Hampshire, Northern New York, 75 days.  
Connecticut, Rhode Island, Southwestern New York, 60 days.  
Southeastern New York and New Jersey, 40 days.  
Delaware, Eastern Pennsylvania, Maryland, District of Columbia, North Carolina, South Carolina, Georgia, Virginia, Florida, Western Ohio, 35 days.  
Western Pennsylvania, West Virginia, Eastern Kentucky and Eastern Ohio, 25 days.  
Lower Michigan, 60 days.

Consumers Not on the Preference List are Limited to the Following Stocks:

Maine, 90 days.  
Massachusetts, Vermont, New Hampshire, and Northern New York, 60 days.  
Connecticut, Rhode Island, Southwestern New York, 45 days.  
Southeastern New York and New Jersey, 30 days.  
Delaware, Eastern Pennsylvania, Maryland, District of Columbia, Virginia, North Carolina, South Carolina, Georgia, Florida and Western Ohio, 30 days.  
Western Pennsylvania, West Virginia, Eastern Kentucky and Eastern Ohio, 20 days.  
Lower Michigan, 45 days.

There is no restriction on the stocks of screenings which may be accumulated by either preference or non-preference consumers, nor is there any restriction on the stocks of Indiana, Illinois, or western coal, which consumers in any class may obtain.

Supervision of the accumulation of stocks in accordance with these limits will be exercised by the several State Fuel Administrators who are authorized to make exceptions where special conditions make it necessary.

## Elgin Revises Its Line

CHICAGO, Oct. 19—The Elgin Motor Car Corp. has adopted an engine with cylinders  $\frac{1}{2}$  in. larger in bore— $3\frac{1}{4} \times 4\frac{1}{4}$ —for its new models, deliveries of which will start in October, and has made a number of other minor improvements. There is a slight change in the shape of the valve lifters, the fan adjustment has been made more convenient; the motor of the Wagner two-unit electric system has been raised to increase the accessibility and a steel generator coupling replaces the former leather disk. The lubrication system has been changed, and it is now pressure to the bearings with circulating splash to other parts. The bodies are now larger and the lines have been improved. The various types include a touring model at \$1,395, a four-passenger military scout and a convertible sedan.

## Ford Surplus Totals \$175,242,728

Company Has Biggest Year in Its History—Cash Receivables Increase \$26,852,084

Totals.....	\$203,749,460	\$165,975,002

LIABILITIES		
	1918	1917
Capital stock.....	\$2,000,000	\$2,000,000
Accounts payable.....	10,653,327	19,983,256
Accrued expenses.....	5,950,564	5,952,903
Depreciation reserve....	9,902,841	6,433,936
Surplus .....	175,242,728	131,604,907
Totals.....	\$203,749,460	\$165,975,002

DETROIT, Oct. 21—Notwithstanding the curtailment in automobile production during the greater part of the year, the financial statement of the Ford Motor Co. for its fiscal year which ended July 31, 1918, shows that it was the biggest year in the history of the company. Its total assets and liabilities amounted to \$203,749,360, which is an increase of \$37,774,458, compared with total resources of \$165,975,002 at the end of the preceding fiscal period and contrasts with \$132,088,219 July 31, 1916, and \$88,535,840 July 31, 1915.

Current assets aggregate \$137,228,134 against \$112,089,824 July 31 last year, and current liabilities total \$16,603,891, in contrast with \$25,936,159 a year ago.

The statement shows a net working capital of \$120,624,243, compared with working capital of \$86,153,665 at the close of the previous year.

The surplus was \$175,242,728. This is an increase of \$43,637,821 for the fiscal period and compares with \$131,604,097 July 31 last year, with \$111,960,907 July 31, 1916, and with \$59,135,771 July 31, 1915. The amount added to the surplus during the year is equivalent to \$2-181.84 a share on the company's 20,000 shares of capital stock of the par value of \$100.

The most remarkable feature of the statement besides the enormous surplus is the large amount of cash receivables, which for 1918 totaled \$91,471,851, as compared with \$64,619,767, or an increase of \$26,852,084. The strength of the company's finances is further indicated by a reduction of \$9,329,929 in the total of accounts payable.

Fixed assets, comprising real estate, machinery and equipment, are appraised at \$66,453,345, against \$53,818,541 a year ago, an increase of \$12,634,804 in plant investment during the year.

### National Implement Association Meets

CHICAGO, Oct. 18—To retain his position in the implement trade and attain anything like the dominancy in the tractor and power farming equipment trade the old-time retail implement dealer will have to adopt the aggressive methods of the motor car dealer:

- 1—Put the tractor on his floor;
- 2—Demonstrate it;
- 3—Sell it for cash, and
- 4—Stand ready to take care of his customer in service and repairs.

This was the consensus of the twenty-fifth annual convention of the National Implement and Vehicle Association, as far as it concerned the automotive industry, which closed here to-day after a three-day meeting.

The retail implement dealer realizes that he will have to meet the motor car dealer on the field of salesmanship if he is to remain in business. He came to Chicago last week to meet with the sales managers' division of the N. I. & V. A., and the sales managers told him so—told him, in the words of R. B. Laurie, sales manager of the John Deere Plow Co., Moline, Ill., that to escape extinction it is necessary and vital for him to add tractors and power farm equipment to his line of horse-drawn equipment.

W. L. Derry, president of the National Federation of Retail Implement Dealers' Association, speaking for himself and other retail implement dealers, assured the tractor and power farming equipment makers at the meeting that the old-time implement dealer was going to sell the tractor and power farming machinery, that the tractor maker and the power farming equipment maker wanted the retail implement dealer to sell their goods, and that the old-time dealers stood ready with a line of repairs to do the business.

## Packard Surplus \$13,657,860

Securities and Reserve for Taxes Show Big Gains—Notes Payable Decreased

DETROIT, Oct. 24—The surplus of the Packard Motor Car Co. as of Aug. 31 and after deducting dividends on preferred and common stock and reserve for taxes, etc., was \$4,346,319 larger than for the previous fiscal year when the surplus amounted to \$9,311,541. The complete statement, which is given herewith, shows a number of increases which have been brought about almost entirely as a result of the war.

For example, securities held have increased from the very small amount of \$19,029 last year to the big total of \$4,514,853 this year, the gain being \$4,495,823. In the case of inventories the gain also has been large. The figure for last year was \$18,556,600 as against \$22,399,168 for this year, a net gain of \$3,842,568. The amount of cash on hand has shown a correspondingly large increase, the figure for last year being \$686,640 compared with \$3,158,509 for this year, a difference of \$2,471,869. Similarly, bills and accounts receivable show an increase of \$4,386,163.

### Notes Payable Decreased

On the liabilities side of the ledger, notes payable have decreased by nearly \$3,000,000. Under the head of reserves for taxes, etc., there is perhaps the biggest change of any. Last year the total reserve for this purpose was \$1,104,748, whereas this year the reserve amounts to \$8,698,254, an increase of \$7,593,506. It is largely because of this great reserve for taxes that the surplus is no bigger, for in normal times much of this reserve would be placed directly in the surplus account.

### Limousine Top to Make Seats

KALAMAZOO, Oct. 22—The Limousine Top Co. will start work immediately building 1500 seats for the Indiana and Service truck companies. These are for war trucks and carry priority numbers in the matter of material and labor. Work is being rushed on the completion of the addition to the plant.

**Lippard-Stewart on the Block**

BUFFALO, Oct. 18—The business and plant of the Lippard-Stewart Motor Car Co. are to be put up at public auction by the Bankruptcy Court on Oct. 21. The property offered in the sale comprises the entire factory equipment, machine shop, stock in trade and tools and office equipment. The value of the stock, according to schedule filed with the report, is \$78,533.71, and the value of the machinery, tools, etc., is \$18,166.29.

**Manitowoc Foundry Sold**

MANITOWOC, Oct. 21—The Manitowoc Foundry & Machine Co., Manitowoc, Wis., has been acquired by David Balkansky, one of the owners of the Manitowoc Iron & Metal Co., and the corporate style is being changed to Manitowoc Foundry Co. The capital stock has been increased to \$50,000, and extensive enlargement of the casting shop will be undertaken at once. The company makes gas engine castings and also operates a commercial foundry and machining plant.

**Sell Killen-Straight Plant**

MILWAUKEE, Oct. 21—The property of the Killen-Straight Mfg. Co., Appleton, Wis., manufacturer of tractors, petitioned into receivership on Sept. 20, will be sold at public auction by Charles L. Marston, Appleton, receiver, on Wednesday, Dec. 11, at 10 a. m. The plant consists of two acres of land; a main brick machine shop and office building, 64 x 200; a foundry, pattern works, blacksmith, tin and woodworking shops, and a warehouse, 30 x 100. The machinery includes three lathes, two radial drills, two drill presses, a gear cutter, milling machine and drop forge press, and other items. The plant is equipped with electrical power and is suitable for the manufacture of farm tractors and farm machinery.

**Chief Gets Engine Contract**

PORT HURON, MICH., Oct. 16—The Chief Motor Co., which occupies the plant formerly owned by the Monroe Motor Co. and Port Huron Construction Co., has been awarded a contract to build 4000 military truck engines for the United States Government. Production will begin at once and the work is to be completed within 6 months.

**Bargaining Collectively Outside or Inside?**

(Continued from page 713)

Even where the employees of a concern are not members of a labor organization, wage difficulties will speedily bring into being in that factory a labor organization for the purpose of getting collective action upon the question.

The manufacturer who objects to this method of action is merely contradicting his own operations when any general and outside interference threatens his industry, or when he thinks the industry should interfere in some outside matters.

**Current News of Factories**

*Notes of New Plants—Old Ones Enlarged*

It is quite usual for him through his industrial association to bargain for or against legislation, against encroachments of other industries, against crooked buyers and other common "enemies."

The laborer in his plant has just the same desire and necessity for collective action and has just as much right to assert himself in that collective way.

The matter of right is not the question; the matter of necessity or advisability is the important part of it, and how the machinery shall be worked out.

The question before the manufacturer to-day—the important decision he must make—is whether he will continue to bargain collectively with the labor organization of which he knows little and with which he does not come into contact save occasionally, or whether he will create the machinery in his own factory which will permanently exercise jurisdiction upon these matters, recognizing in the formation of that body the workers' right to be considered in the questions affecting his remuneration and his conditions of work.

**Collective Bargaining Not New**

He should remember that collective action upon wage systems is not a new thing, nor is it the original idea of a labor union; by legislation in favor of the employer it was for centuries the subject of national collective action; when the right of private contract was restored it was the subject of action by the manufacturer who saw no use in paying different wages for the same operation.

It has been adopted by the labor organization as the only way in which to make its power felt, and the manufacturer's objection to it is not an objection to principle of collective bargaining *per se*, but to the labor organization's very effective and embarrassing use of the weapon.

It is obvious that for a long time to come the system of payment based upon time will be the one most generally employed, and that for a given operation in any shop 75 per cent of the workers will turn out about the same amount of finished work and secure about the same pay.

This is the majority which governs the action of the labor organization, and it is the majority which will govern the necessities of the individual factory.

These are the conditions and requirements which must be met by some form of collective bargaining and also by some system of payment which will at the same time offer recognition to the individual.

**New Northwestern Chemical Plant**

MILWAUKEE, Oct. 21—The Northwestern Chemical Co., Milwaukee, which lost its plant at Sixty-first and State Streets, town of Wauwatosa, by fire in September, will erect a new plant costing about \$35,000. The building will be 50 x 150 ft., fireproof throughout.

**Milwaukee Brass Enlarges**

MILWAUKEE, Oct. 21—The Milwaukee Brass Mfg. Co., 249-251 Lapham Street, is enlarging its facilities in order to be better equipped to handle direct and indirect war work.

**Raybestos Molded Facing Replaces Woven Facing**

BRIDGEPORT, CONN., Oct. 19—The Raybestos Co. has discontinued the production of Raybestos woven clutch facing, and upon the completion of orders now in hand will manufacture only the new Raybestos molded clutch facing. The price is said to be no higher than the woven facing.

**Ford Employs 46,050**

DETROIT, Oct. 19—At a recent checking up of the new payrolls of the Henry Ford interests it was found that Henry Ford employs 46,050 persons. This number includes every man working in the Highland Park plant, the shipyards at River Rouge and the tractor plant at Dearborn.

**Fulton Foundry Acquires Factory Site**

CLEVELAND, Oct. 18—The Fulton Foundry & Machine Co. has purchased 6¼ acres of land in the industrial section along the Nickel Plate Railroad in the northeastern part of the city. The property was purchased for future developments.

**New Canadian Denby Plant**

WINDSOR, ONT., Oct. 19—The Denby Motor Truck Co. of Canada has purchased a site at Chatham, Ont., and will erect a new factory.

**Steel Output Increases**

WASHINGTON, Oct. 18—Improvement in the steel situation of the country is shown in a survey just completed by the War Industries Board showing that pig iron is now being produced at the rate of over 42,000,000 tons and steel plates at the rate of 6,000,000 tons per year. Plate production is more than 40,000 tons a week higher than ever before. Production of all steel is at the rate of 33,000,000 tons per year. Despite these increases the war board states that the steel situation is still critical and that, for example, while we are producing 33,000,000 tons of steel a year, the demands of the Government and the Allies total 50,000,000 tons.

**Mack President Hoover Steel Ball**

ANN ARBOR, MICH., Oct. 19—Walter C. Mack was elected president of the Hoover Steel Ball Co. at the annual meeting of the stockholders. He takes the place of L. J. Hoover, who died recently. The other officers are: Vice-president, F. A. Stivers; treasurer, M. J. Fritz; secretary and manager, H. D. Run-ciman; assistant secretary, William Arnold, Jr. These officers and Dr. L. P. Hall, D. F. Zimmerman, H. A. Douglass and R. T. Dobson form the board of directors. The executive committee consists of R. T. Dobson, Dr. L. P. Hall, M. J. Fritz, F. A. Stivers and William Arnold, Jr.

William W. Mountain, president of the Flint Varnish & Color Works, Flint, Mich., has resigned. It is reported that after a brief vacation at French Lick Springs he will enter another line of business.

Lester W. Place has resigned as sales manager of the Allen Motor Co., Fostoria, Ohio, and will announce his future plans shortly.

William Ross, Detroit, the engineer who designed and completed the model truck of the Louisiana Motor Car Co., Shreveport, La., has been appointed chief engineer of production of the company.

Grover C. Farnsworth, at one time advertising manager of the former Metzger Motor Car Co., is now an ensign in the naval aviation corps, stationed on the eastern coast.

**H. F. Blanchard of Thermoid Co. a Victim of Influenza**

TRENTON, N. J., Oct. 21—H. F. Blanchard, sales manager for the Thermoid Rubber Co. for the past three years, died of influenza at his home in Trenton. Mr. Blanchard was about 31 years of age.

**New Tractor Plant in Ypsilanti**

YPSILANTI, MICH., Oct. 19—The controlling interest of the Michigan Press Co., manufacturer of the Perkins power presses, has been purchased by Theodore H. Millington and Charles W. Chapman. The company expects to bring out a four wheel drive tractor. About forty men will be employed. Millington, who was formerly with the General Motors Co., is president of the reorganized company; Chapman, secretary and treasurer, and C. A. Perkins, vice-president.

**Canada Adopts Gasoline Regulations**

OTTAWA, ONT., Oct. 18—Regulations have been approved by the Governor-General-in-Council to control the wholesale and retail sale of gasoline in Canada. The regulations provide for the licensing of all persons who deal in gasoline and certain fees are prescribed based on the volume of gasoline sold during the previous

## Men of the Industry

*Changes in Personnel and  
Position*

year. In cases where dealers fail to obey the provisions of the law, the Fuel Controller has absolute power to cancel or suspend license without notice. All persons who continue to deal in gasoline without making application for a permit to do so will be subject to a penalty of \$50 for each day such business is conducted in contravention of the regulations. Provision is also made for the keeping of certain sales records, and all retailers of gasoline are called upon to post in their places of business the wholesale as well as the retail cost of gasoline handled by them. One important provision of the regulations is that, for the duration of the war, the sale of gasoline on Sundays is absolutely prohibited. Retail maximum prices are prescribed for the establishments selling gasoline in quantities over a thousand gallons a month. Profits are based on a ten per cent advance over the wholesale cost delivered.

**Training and Dilution Labor Districts**

WASHINGTON, Oct. 19—The United States has been divided into districts by the Training and Dilution Service of the Department of Labor, and superintendents for each will be named who will explain the purposes of the Training and Dilution Service to employers in their respective localities. In the main this will comprise explanations of the establishment of factory training departments for the conversion of unskilled into skilled workers.

**New 24-Cylinder Aviation Engine in Production**

RACINE, Oct. 19—The Sieverkropp Engine Co. has started work on the construction of a 24-cylinder, two-cycle, rotary aviation engine, which is expected to develop 500 h.p. at 1400 r.p.m. The engine is of a new type recently developed by Henry Sieverkropp, president and chief engineer of the company. The 24-cylinder engine is being built at the suggestion of the technical division of the Government aircraft board, on the basis of the performance of a smaller experimental engine completed by Sieverkropp about two months ago and submitted for official tests. The engine already constructed is a 12-cylinder, two-cycle, rotary type, rated at 72 hp., but it has developed 140 hp. at 2800 r.p.m. without appreciable effort. Mr. Sieverkropp is confident that the 24-cylinder motor will weigh considerably less than 1.98 lb. per horsepower and by the use of aluminum cylinders and other economies in weight expects to reduce the ratio to practically 1 lb. per horsepower.

**Winningham Out of Oil Division**

WASHINGTON, Oct. 18—C. C. Winningham, who on Aug. 1 was appointed chief of the Gasoline Section and Director of Publicity of the Oil Division of the Fuel Administration, has left that division. He has taken up other work with the Department of Labor. Winningham's place is to be taken by George H. Pride, of the Heavy Haulage Co., New York, who is Regional Director for a number of eastern states for the Highways Transport Committee. Pride is giving up his work with the Highways Transport Committee.

Edwin E. Taylor, formerly advertising manager of the Acme Harvesting Machine Co., Peoria, Ill., has resigned this position to become director of advertising for the Turner Mfg. Co., Pt. Washington, Wis., manufacturer of farm tractors, gas engines and other power machinery.

J. G. Perrin, chief engineer of the old Lozier Motor Co., who took up government work in the aviation department directly after America's entry into war, is now manager of the Canadian plant of the Willys-Overland Co. at Toronto.

Louis Geer has been appointed assistant to John Squires, chief of the materials division of the Denby Motor Truck Co., Detroit.

O. E. Harmon has been placed in charge of the service department of Fuller & Sons Mfg. Co., Kalamazoo. M. E. Fuller has been appointed employment supervisor.

Ralph H. Ratliff, advertising manager of the Butler Mfg. Co., Indianapolis, has resigned and will take up farming.

J. S. Burdick, for the past six years body engineer of the Locomobile Co. of America, Bridgeport, has severed his connection with the company and enlisted in government work for overseas service as automotive engineer.

Douglas C. Halley, formerly connected with the wholesale selling staffs of Scripps-Booth and Studebaker, has been appointed a first lieutenant in the Motor Transport Corps, and is stationed at Camp Holabird, Baltimore.

Don Ferguson, chief engineer of the old Cartercar Co., and for some time a designing and consulting engineer in Detroit and Milwaukee, has become resident engineer of the ordnance department under Major James Guthrie, commanding the Detroit district.

Florence Gardner, secretary to A. A. Gloetzner, sales manager of the Covert Gear Co., Detroit, has been appointed purchasing agent for the Louisiana Motor Car Co., Shreveport, La.

George Crittenden, sales manager of the old Krit company, has been commissioned a lieutenant in the navy.

## Truck Sales Managers Meet

CLEVELAND, Oct. 19—The National Association of Motor Truck Sales Managers, which was formed about two months ago, held its third meeting yesterday and to-day at the Statler Hotel and outlined plans of action for future work.

It has a permanent office at 1344 Wells Building, Milwaukee, where Executive Secretary J. M. Carney will conduct the organization's business.

One of the first things to be taken up is the contract with dealers, which exists to-day in many varieties. The sales managers believe they can work out a contract which will be acceptable to all the manufacturers.

It is also believed much can be done to make uniform the methods of handling time payments, and that the trading of used trucks can be made a real business and free from the abuses that grew up with passenger car trading.

An interchange of information is also planned, one of the matters to be covered being the records of shifting sales-

men who go from plant to plant and work for short periods.

The next meeting will be held Nov. 15-16 at the Lafayette Hotel, Buffalo.

The directors, elected some time ago, chose the following officers: J. E. Tracey, Sterling Motor Truck Co., president; H. T. Boulden, Selden Truck Sales Co., first vice-president; W. D. Wrightmire, Winther Motor Truck Co., second vice-president; E. T. Herbig, Service Motor Truck Co., secretary; A. R. Fernald, Willys-Overland, Inc., treasurer; J. M. Carney, executive secretary.

The directors, in addition to Tracey, Boulden, Wrightmire, Herbig and Fernald, are: F. J. Pardee, Diamond-T Motor Co.; F. L. Pierce, Federal Motor Truck Co.; A. C. Burch, Clyde Cars Co.

The membership includes in addition W. B. Morse, Brockway Motor Truck Co.; B. D. Jones, Republic Motor Truck Co.; W. S. Stevenson, Bethlehem Motor Corp.; F. J. Alvin, United States Motor Truck Co.; G. W. Weller, Indiana Truck Corp.; F. R. Mitchell, Gramm-Bernstein Motor Truck Co.; C. H. Woodruff, O. Armleder Co.; J. D. Potter, American

Motor Truck Co.; D. F. Wittaker, Acason Motor Truck Co.; C. H. Roberts, Bessemer Motor Truck Co.; L. Lynch, Columbia Motor Truck & Trailer Co.; W. J. Dietrich, Harvey Motor Truck Co.; C. A. Wales, Locomobile Co. of America; E. F. King, Available Truck Co.

## What Langley Did for the Science of Aviation

(Continued from page 718)

of 4600 ft. in 1¼ min. While the distance from the houseboat in a straight line to the point at which the aerodrome descended was only about 1600 ft., yet it was estimated by those present that this straight line distance was certainly not greater than one-third of the total length of past travels, which would mean a distance of something like 4800 ft. The length of the course as painted on a coast surveyor map and afterward measured was 4200 ft., and it, therefore, seems safe to say that the total distance traveled was about three-quarters of a mile, and the speed was, therefore, about 30 miles an hour."

## Extracts From Senate Aircraft Report

(Continued from page 701)

and had an affirmative reply, following which he delved deeply into Mr. Hunt's experience as an engineer. Senator Reed asked Henry Ford his opinion of the Delco system and if it were as good as any and heard him say "I think it is." Senator Chamberlain questioned R. H. Collins of the Cadillac Motor Co.: "What do you think of the Delco ignition system?" and had the answer: "It cannot be better."

Senator Reed asked W. C. Leland: "What is the best ignition, in your opinion, to use with the Liberty engine?" and secured the answer: "My belief on this is very pronounced, that the type of ignition now being used, which is the Delco ignition system, is the best ignition system that we know of for this high-speed, multiple-cylinder work. We base that on our experience with the Cadillac company. We have used the Delco system since 1911."

Later in gathering testimony Senator Reed encountered an army officer who had once had trouble with the generator on the Liberty engine and he spent some time trying to get the officer to admit that it was the Delco system that had failed, but the officer insisted that it was the generator.

Many other interesting facts are revealed in the reading of the testimony. The opening inquiry was with Col. C. G. Edgar, who was in charge of aviation field construction. In the course of the interrogation the Colonel admitted that he had had no previous experience in this work and had been in the sugar business, besides being "interested in navy beans." He also testified that at the outset we attempted to match the British training fields, established four years, and tried to float 300 cadets with 600 enlisted men and 72 officers at each field, but found that we required 750 men to float 150 cadets. The reason for numerous fatalities from sickness at flying fields in 1917-1918 he showed were due to over-crowding. At Camp Kelly No. 2, where accommodations had been erected for 2100 men, 4700 soldiers had been housed.

J. E. Kepperly, vice-president of the Curtiss corporation, told how production had been hampered by frequent separate investigation by the numerous agencies, the Department of Justice, Navy Intelligence, Army Intelligence, Niagara Frontier League and the company's secret service. Often, he said, each of these agencies would make its appearance and demand to be taken through the plant and shown books and so forth, always creating a confusion and delay.

At the Packard plant Senator Reed by questioning O. E. Hunt developed that the Packard twelve-cylinder motor car engine was designed in December, 1914, and not ready for production before August, 1915, from which he drew comparisons in the time between the design and production of the Liberty airplane engine. Mr. Hunt also told of the Bugatti engine made in France, which has

a cannon mounted in the crankcase and which shoots seven or eight shots, alternating incendiary and explosive shells automatically. The shooting, he said, is aimed by the control of the plane.

An interesting conversation ensued when in the testimony of George W. Houston, general manager of the Wright Martin Aircraft Corp., he mentioned George W. Goethals, and Senator Frelinghuysen inquired: "Is this George W. Goethals, General Goethals?" Houston replied: "Yes, sir," and the inquiry was made by Senator Frelinghuysen: "I understand that General Goethals' connection with the company was prior to our entrance into the war?"

At this point, states the testimony, informal discussion occurred which the reporter was directed not to record. And this was followed by additional inquiries:

Senator Frelinghuysen: "Was General Goethals' connection with the company known to the Government at the time he was called into service as an officer?"

Mr. Houston: "It was. General Goethals at that time was president of the Wright Martin Aircraft Corp. and he resigned the presidency shortly after he entered the Army as acting quartermaster general."

Senator Frelinghuysen: "Has General Goethals any interest in the stock of the company?"

Mr. Houston: "I cannot say as to his personal interests, but I do not think so."

Tests published in the testimony of the De Haviland plane equipped with a Liberty engine show that with fighter equipment it had an endurance at full throttle of 1 hr. 58 min., with half throttle 2 hr. 38 min., at 6500 ft. Its ceiling was 19,700 ft., speed in 10,000 ft. climb, 13 min., speed at ground level, 120 m.p.h., at 6500 ft., 118 m.p.h., at 10,000 ft., 114 m.p.h., and at 15,000 ft., 107 m.p.h.

Other testimony by Col. D. E. Clark of the Department of Military Aeronautics developed that he went abroad with the mission under Colonel Bolling, which investigated the merits of foreign planes, and that he recommended our adoption of:

De Haviland 9 for day bombing.

Bristol fighter for observation.

Martinsyde equipped with Liberty engine for single seater pursuit.

Spad with 150-hp. Gnome and 180-hp. Hispano Suiza engines for single seater combat.

Caproni triplane for night bombing.

The recommendations made no mention of the De Haviland 4 which we are now building. The Colonel also told that according to boasts by Lieutenant-Colonel Hall, formerly of the Hall-Scott Motor Co., 3600 changes had been made in the De Haviland 4. This was denied by the statement of another officer, Col. T. H. Bane, who stated in his testimony that the De Haviland 4 as made in this coun-

try was very similar to the British and had only very few and minor changes.

Complaints were filed by several officers in their testimony about the method used in this country of bending the cables, sustaining the planes, over the "eye" and wrapping and soldering them. It was stated that in many cases the solder does not soak through, with the result that the cable is hidden from view under a pipe-like shape formed by the solder, and is not only dangerous because it is not firmly held, but also because inspection is impossible. The British Government splices the cables after wrapping them about the "eye," and, said the various officers, the same custom should be followed here.

An interesting side-light on the failure of our Bristol airplane program was revealed in the testimony by Major H. S. Martin of the Department of Military Aeronautics, who explained that Col. D. E. Clark, who recommended the adoption of the Bristol and has been blamed for its failure, had been advised prior to his trip abroad that the Liberty engine would weigh 740 lb., and in consequence assumed that it could replace the Rolls Royce, which weighed 700 lb. In addition, said Major Martin, after the receipt of the Bristol plane in this country it was so "improved" that its weight was increased by 800 lb. and the combination of the heavier Liberty engine weighing 825 lb. instead of 740 plus the 800 lb. of added weight in the plane itself was the actual cause of the failure.

Testimony by Major G. H. Brett, Department of Military Aeronautics, supplied the committee with figures showing that 3129 airplanes had been furnished our Army in France by foreign sources up to July 31, 1918. Of these 1617 were school planes, chiefly Nieuports, and 1512 were combat planes, comprising mainly Sopwiths and Spads.

"Improvements," such as those on the Bristol mentioned above, were quite numerous. Col. H. H. Arnold, Assistant Director of Military Aeronautics, told that the compasses used in the De Haviland planes were worthless, that they had "died of improvements." "Our production people," he said, "improved on it to such an extent they made it worthless."

The English in mounting the compasses use agate to reduce the friction of the rotating member and because it is a non-conductor. We "improved" the compass, said Colonel Arnold, by putting steel on the agate, removing the non-conductor feature and making the compass worthless. In this connection it can be noted that many months ago Captain Fritt, British compass expert in this country, informed the authorities that as we used the compass it was of no value.

Examples of the worthlessness of much of the testimony are frequent. The instance of the inquiry of the cc

mittee with members of the French Mission is a confusion of replies that is typical of much that took place. Senator New inquired of the French officers if it would not be best to make all the planes we possibly can, and received the following replies:

Edouard De Billy: "Certainly, by all means."

Colonel Tulasne: "Certainly."

Lieutenant Marquisan: "Oh, no. It is better to have one plane of the very best type than ten of an obsolete type."

Again, many witnesses, it developed, were men with high-sounding titles and little experience. In the instance of W. K. Rider, called before the committee, it developed that he was in the production engineering department of the Signal Corps with the title of "Aeronautical Mechanical Engineer, Signal Corps Service at Large," and that he had no college education, was 20 years old and had worked three years for the Wright-Martin Aircraft Corp. He also told that he was not a flier.

Similarly Major Cushman A. Rice testified about British planes to the committee, the R. E., he said, was an experimental plane and very fast, and according to British experts here the R. E. is a two-seater artillery plane, neither fast nor experimental. He also told that Great Britain uses a 75-hp. Rolls Royce engine in certain planes, while the British authorities claim that no Rolls Royce of that horsepower has ever been made. Further confusing testimony was in the nature of that given by the French officers who told the committee that they did not like the De Haviland 4 because it was not a good fighting plane as well as an observation plane. Great Britain never intended the De Haviland for aught but observation work when it was designed, and such testimony tended only to confuse and mislead.

Discussing fatalities at flying fields in this country, Colonel Arnold told that after these commenced to increase a diagram was devised with curves, which showed that the majority of accidents occurred at 3 p. m., and he said: "I wish to state that as soon as we got that curve fixed up and found out that the majority of casualties occurred at about 3 o'clock in the afternoon, General Kenly said 'we will cut out flying at 3 o'clock' and so he stopped all flying between the hours of 11 a. m. and 3 p. m." The committee did not inquire if this stopped or reduced the casualties, nor why the greatest number of deaths occurred at 3 p. m. Since the greatest amount of flying took

place at that hour, which is commonly recognized as the best flight hour, it is not surprising that the greatest number of accidents resulted at that time. It would be interesting to learn if the greatest "casualty occurrence" has shifted to some other hour, and if that hour is not now the one when most flights are made.

Another point in the general testimony that emphasizes itself to the reader is the absence of any testimony from those men who were most particularly interested and who were so severely criticized. The 1200 pages contain no statements either by Col. E. A. Deeds, Howard E. Coffin or others who were criticized by various officers and in turn by the committee when it compiled its report. There are several instances during the testimony where single individuals made statements harmful to the original Aircraft Production Board, and there is at least one instance where the word of one individual was accepted by the committee and incorporated in the final report to the detriment of the members of the Aircraft Production Board. And in consequence the impression remains that the men thus criticized were tried without a hearing, while the army officers and others who testified were given the opportunity to make these men appear guilty possibly of their mistakes.

Praise of the Liberty engine is frequent and convincing throughout the testimony. Henry Ford, W. C. Leland, R. H. Collins, C. F. Kettering and others testified that it was the "best engine they knew of." Major R. S. Brown, asked by Senator Reed if he knew of any engine better than the Rolls Royce, replied: "Yes, sir, the Liberty engine." Captain D'Annunzio, asked by Senator Chamberlain: "How about the power of the Liberty engine as compared with the Fiat, pound for pound?" replied: "The Liberty engine is better."

#### Government Sulphuric Acid Plants

WASHINGTON, Oct. 19—Two sulphuric acid plants are to be erected in Pennsylvania under the supervision of the Construction Division of the Army, at a cost for both plants of \$3,000,000. These plants will be operated by the Government. One will be located at Emporium and the other at Mt. Union.

The Emporium plant will consist of 8 units on a site which has been selected upon Driftwood Creek, close to the plants of the Aetna Explosive Company and the Emporium Iron Company. In the event that sufficient power cannot be ob-

tained from the plant of the iron company, a one-thousand kilowatt-power plant will be erected. The estimated cost of this plant is \$2,000,000.

The Mt. Union plant will be erected adjacent to the plant of the Aetna Explosive Company. Twenty acres of land have been purchased.

#### Michigan Press Co. Reorganized

YPSILANTI, MICH., Oct. 19—The Michigan Press Co. has been reorganized, Theodore H. Millington of Detroit becoming president; Charles W. Chapman, secretary-treasurer, and C. A. Perkins of Ypsilanti, vice-president. The first two named parties have a controlling interest in the company, Millington being an engineer who was formerly with the General Motors Co., and Chapman being a Detroit attorney. The company will continue to make the Perkins power presses and will bring out a new four-wheel drive tractor which Mr. Millington has perfected.

#### New Mail Export Rates

WASHINGTON, Oct. 19—Under new regulations by the War Trade Board, articles shipped by mail to the United Kingdom, France or Italy, when not composed of samples of merchandise, will require individual export licenses and applications will have to be made for them. Hereafter, however, shipments can be made without individual export licenses through the mails of any commodity not on the official export conservation list when such shipments are destined to:

Abyssinia, Afghanistan, Argentina, Belgium, Bolivia, Brazil, China, Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, Egypt; the colonies, possessions, and protectorates of Great Britain; the colonies, possessions and protectorates of France; Guatemala, Haiti, Honduras; the colonies, possessions and protectorates of Italy; Japan, its possessions or protectorates; Liberia, Monaco, Nepal, Nicaragua; the colonies, possessions or protectorates of the Netherlands; Oman, Panama, Paraguay, Peru, Salvador, San Marino, Siam, Uruguay (excluding any portion of the foregoing occupied by the military forces of Germany or its allies), or shipments of samples of no commercial value, or any commodity, when such shipments are destined to the United Kingdom, France, Italy or Japan, their colonies, possessions and protectorates (excluding any portion thereof occupied by the military forces of Germany or its allies).

These shipments which can be made without the individual export license should have noted on the package the following:

"Shipped under export license RAC—52."

A statement of the contents.

Name and address of shipper.

Name and address of consignee.

## Calendar

#### CONVENTIONS

Oct. 22-24—Atlantic City, N. J. Annual, Automobile Accessories Branch, National Hardware Association of the United States, Marlborough-Blenheim Hotel.

#### ENGINEERING

\*4-15 New York. Society of

Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

#### SHOWS

Oct. 12-19—Atlanta. Tractor demonstrations. Eastern State Fair and Automotive Exhibition.

Oct. 14-27—Dallas, Tex., Seventh Annual Texas Automobile Show. Texas State Fair.

Oct. 30-Nov. 4—Shreveport, La. Tractor demonstration. State Fair.

Nov. 11-16—Phoenix, Ariz. Tractor demonstration, State Fair.

Nov. 11-16—Pittsburgh, Pa. Fall Automobile Show. Motor Square Garden, Automobile Association of Pittsburgh.

Jan. 13-19—Des Moines, Ia. First Tractor Show. Des Moines Thresher & Tractor Club. H. J. Clark, Mgr.

### *Here's How Hudson Dealers Are Adjusting Themselves to Meet the New Conditions*

Service is fast becoming the chief and practically exclusive business of many Hudson dealers.

Sales Departments are being curtailed as the number of Hudsons still to be manufactured decreases.

Nevertheless, Hudson dealers have in many ways expressed their enthusiastic support of the Hudson policy and their faith in the Hudson future.

There are demands from a dozen sources for every Hudson Super-Six that the factory can still deliver.

This loyal adherence of Hudson dealers and this testimony to Hudson quality from owners, prospective and present, are naturally sources of great satisfaction at this time.

Yet the most satisfying feature of present abnormal conditions is the *optimism* of Hudson dealers.

They apparently look upon the approaching period of non-production as merely an interim for "taking stock", as it were, and getting ready for a period of Hudson achievement and success that will exceed even the wonderful years in which the Super-Six made automobile history.

### HEATER BUSINESS IS BOOMING WITH

**UTILITY Pump  
for All Cars  
\$12.00  
For Fords \$7.50**

### UTILITY HEATER for ALL Cars

With the first signs of cold weather, the great rush for Utility Heaters has started. Thousands of users are getting Utilities installed *now*, before real cold weather sets in.

Utility dealers everywhere are smashing last year's fall heater sales. Few car users these days will endure 8 months of cold motoring when a Utility Heater costs so little. Send for free descriptive pamphlet.

#### A Model for Every Car

Utility Protected Heater for all cars. Price \$20.00.

Utility Front Seat Heater for roadsters, driving compartments of large cars and trucks. Also for rear installation on Maxwell and Chevrolet. Price \$12.50.

Utility, Jr., Protected Heater for Fords and other small cars. Price \$9.00.

Utility De Luxe Protected Heater for 8-cylinder cars. Regulated by foot adjuster. Price \$25.00.

Handled by good dealers everywhere. Dealers: Stock from your jobber. Get your share of heater business this next six months.

**UTILITY Rim  
Wrench for  
All Cars  
\$1.75**

Truck Manufacturers—Make the Utility Heater standard or optional equipment.

**UTILITY  
Universal Wrench  
Set for All Cars  
\$3.50**

**UTILITY Pedals  
for Fords  
\$1.25**

## Hughes Aircraft Report a Vindication

Shows That There Has Been Some Incompetence and Stupidity  
But None of the Gross Irregularities Charged

Rumors of Enormous Waste Found Untrue—Automotive Industry Put in Favorable Light—Some Individuals Censured—Squier Called "Incompetent"  
—Deeds May Face Court Martial—Rebukes for Vincent,  
Mixer and Vrooman—Coffin Exonerated

By Allen Sinsheimer

**W**ASHINGTON, Oct. 31—There has been no graft in the American air program.

There has been no profiteering.

There have been no pro-German or disloyal attempts by authorities to hamper the work.

There have been no criminal activities by members of the air boards, no dishonesty, wholesale or retail.

There are of course in this report some points that reflect seriously upon a few individuals. This was to be expected. Also there are points upon which there will be many diverse opinions, and this could have been anticipated.

*But viewed in contrast with the Borglum charges of thievery and disloyalty and the later Senate denunciations, the Hughes Aircraft Report, issued here to-day, together with a brief statement of concurrence by Attorney General Gregory, is a complete vindication of the members of the aircraft boards, military and naval, of the engineers of the automobile industry AND OF THE INDUSTRY ITSELF.*

*It is particularly an exoneration of Howard E. Coffin, former chairman of the Aircraft Production Board, and establishes thoroughly the earlier claims that anti-administration influences were much too eager to heed the Borglum accusations.*

In fact, with the background of extravagant charges of waste, traitorism and criminal activities that were spread broadcast last spring and dragged many good names in the mire, the few findings conveying censure in the Hughes report appear trivial, and the report must be regarded as being *practically a clean bill of health* for those in charge, both in the past and present.

The report is thorough. It is conservative. It savors of the work of a man who has quietly and exhaustively handled his job and made the sanest results from it. And it stands a complete contrast from the sensational and somewhat unreliable reports of the past that seemed bent more to establish delays than to understand or dispell them.

Careful perusal, while it may leave the impression that in some instances Mr. Hughes may have been too harsh, will at the same time leave the reader with the knowledge that *it is the work of a conscientious man.*

The charges made many times in Congress and the press and heard frequently that the \$650,000,000 appropriations have been wasted and thrown away are completely refuted at the outset by a statement that tells that, of the appropriations of \$691,851,866.47 made for the air program, only \$134,044,395.27 was disbursed to June 30, 1918, the end of the fiscal year, while at the same time 6171 planes and 12,633 engines had been produced.

## High Lights of the Hughes Report

No graft; no profiteering; no disloyalty.

Col. Deeds charged with issuing false publicity, and improper official conduct.

Col. Vincent accused of violating criminal code, but without intent to defraud.

Cost-plus profits too liberal.

Signal Corps responsible for delays.

Some enemy alien employees found.

Little waste in aircraft appropriations.

Extravagant labor costs found.

Delays due to lack of knowledge and experience.

*Lt. Col. Jesse G. Vincent, prior to the war, was vice-president in charge of engineering for the Packard company at a salary of \$25,000 per year which he gave up to take up army aircraft work. He was the important designer in the work of designing the Liberty engine.*

*Charges of criminal action by members of the aircraft boards are shown to have been mere "gossip" by the statement that no member of the boards was found guilty of a criminal act.*

It might naturally be expected that, among the many men taken from industrial life to fulfill positions as civil servants, some might follow their life-long industrial practices and, although actuated solely by altruistic motives, yet violate their positions, and this appears to be what has been done in some cases.

And, says the report in reply to the accusations that pro-Germanism prevailed, *there is no evidence to substan-*

*tiate the belief that work was hampered by disloyal authorities.*

The most serious accusations made as a result of the investigation are against Col. E. A. Deeds, formerly in charge of the Equipment Division, Signal Corps; Lt.-Col. Jesse G. Vincent, who designed the Liberty engine; Lt.-Col. G. W. Mixer, formerly of the Signal Corps, and 2d Lt. S. B. Vrooman, formerly propeller inspector.

Col. Deeds, upon whom much of the charge of dishonesty fell last spring, was found by Mr. Hughes to be in no instance guilty of a criminal act. He did, however, says the report, act as a confidential adviser to a former business partner while in the service of the United States and was also guilty of issuing untrue publicity, and as a result the attention of the Secretary of War is demanded by the report and a recommendation for trial by court martial made.

The other officers named are charged with violations of a criminal code that prohibits army officers from engaging in official business transactions with concerns in which they are financially interested. In the case of Lt.-Col. Vincent, who was formerly vice-president in charge of engineering for the Packard Motor Car Co., Mr. Hughes, while discovering no fraud or intent to defraud, found that Vincent owned stock in the Packard company while at the same time he engaged in transactions with that company as an officer in the U. S. Army.

It is in connection with the recommendation that Vincent be prosecuted under the criminal code, violated because "officers fail to show proper appreciation of the impropriety" of violating this code, that the report may seem harsh to some. Vincent, as vice-president of Packard, earning a salary of \$25,000 a year, gave up that position to become a major in the army earning less than 20 per cent of that amount. He and C. V. Hall were the designers of the Liberty engine, America's greatest aeronautical achievement.

The report, which embodies a summary of 17,000 pages of testimony taken from 280 witnesses, deals principally with appropriations and expenditures, responsibilities, possible criminal activities, causes for delay in the program, contractors' profits, labor, the cross license agreement and forms of contracts.

### What Deeds Said

Col. Deeds when interviewed by a representative of AUTOMOTIVE INDUSTRIES stated that he could not at this time make a public statement, and that in view of the possible trial by court martial he intends to refrain from all public discussion and make his reply to the charges to the War Department at the proper time.

### Baker Considers Court Martial

Secretary of War Baker is considering the charges against Col. Deeds and the possibility of placing him on trial to face a court martial. Last Spring, when very serious charges were made, both General Squier and Col. Deeds requested the Secretary to institute a military court to investigate them. At that time, however, the Secretary preferred to await the outcome of the Hughes inquiry. Whether or not he will order the trial now of Col. Deeds will be decided following full consideration of the report.

Col. Edward A. Deeds, formerly Chief of the Equipment Division of the Signal Corps, was one of the founders of the Dayton Engineering Laboratories Co., manufacturers of the Delco ignition system. In addition he has been interested in other Dayton enterprises. He came to Washington in 1917 first as a member of the Aircraft Production Board and later with a commission in the Signal Corps of the U. S. Army.

It does not enter into the present status of aircraft production other than to state recent production figures and to give praise to the present authorities, and it does not tell future aircraft plans, regarding these as "military secrets."

Of the \$691,851,866.47 appropriated for aircraft, it is told in the accounts of expenditures that the obligations incurred during the fiscal year ending June 30, 1918, including not only production but also field construction, truck purchases, planting of castor beans, etc., amounted to \$474,910,706.55. This again contrasts strongly with the frequently heard remarks that the appropriations have been wasted. As a matter of fact, but \$24,000,000 has possibly been wasted, according to the report, and this in a manner that could be expected in an industry as new and untried as aviation.

This sum was expended for 1600 SJ-1 planes and Hall-Scott A7a engines costing \$11,027,733.61 and for the Bristol fighters that cost \$2,500,000 to date and will cost more when the charge for cancellation of the contract is presented. The SJ-1 planes were condemned as dangerous. The Bristol was an English plane in which our authorities attempted to place too heavy an engine.

*Every nation in this war has expended many millions in similar manner—expenditures classed as for experimental work.*

Full authority for the establishment of the air program and for the control and administration of all matters pertaining to aircraft production—a question that has confused many and to a degree forced the resignation of Howard Coffin—has definitely been placed upon Brig. Gen. George O. Squier, Chief Signal Officer, and in turn upon his assistants, Col. E. A. Deeds and Col. R. L. Montgomery.

The Aircraft Production Board, which was headed by Howard E. Coffin, and which, it will be recalled, was the center of the storm prior to the Senate investigation, was found by Mr. Hughes to be solely advisory, and from August, 1917, on gradually became less important. "It will be observed that the order creating this board," says the report, "had the

## The Hughes Report Recommends:

**Trial by court-martial of Col. Deeds.**

**Enforcement of statutory conditions against Vincent, Mixter and Vrooman.**

**Investigation by Federal Trade Commission of proper costs of mahogany for propellers.**

**Supervision by Department of Justice of the re-audit of accounts.**

**Assignment of Bureau of Investigation, Department of Justice to follow up suggested delinquencies.**

**Investigation of spruce production on Pacific Coast.**

*effect of greatly limiting its authority and that it was even denied the right to hold direct communication with manufacturing plants."*

Commenting upon personal interests, Mr. Hughes stated that John D. Ryan, W. C. Potter and Howard E. Coffin were found to have taken no part in Government transactions with any concerns in which they had personal interests. Major H. C. Marmon was reported as having engaged in a trivial transaction but one that was in no way to be considered as seriously wrong and which was entirely without intent. All other members of the naval and military air boards were likewise exonerated of any criminal activities.

The findings against Col. Deeds followed exhaustive investigation. *No substantiation was found of the claim that Deeds was earlier named "Dietz," and it was said, according to the report, that he had had four generations of ancestors in this country.*

The inquiry developed that Deeds, together with Charles

## Ryan Gratified with Report

"I have just hastily read the report of the aircraft investigation made by Judge Hughes," stated John D. Ryan, Director of Aircraft Production, "and I am gratified of course to know that the investigation has resulted in finding no such conditions existed last spring in the work of aircraft production as was indicated by charges made at that time. I have long been satisfied that the men who preceded me did a very great patriotic service and did not use their position with the Government to make personal profit."

F. Kettering, vice-president of the Dayton Engineering Laboratories Co., and H. E. Talbott, associated with Deeds in business, have a common agent, George B. Smith, who looks after their financial affairs jointly. A letter from Deeds to the Aircraft Board, stating that he had given up all interests in the United Motors Co., Dayton Engineering Laboratories Co., Dayton Metal Products Co. and the Domestic Building Co., was introduced in the report as bearing the date Aug. 28, 1917. Mr. Hughes reported that he found that Deeds retained his stock in the United Motors Corp. and the Domestic Building Co. for some time beyond that date, and further had made a transfer of his United Motors shares at a later time to Mrs. Deeds. But despite these conflicting conditions, he found no evidence that would indicate criminal activities on the part of the colonel.

Regarding the orders placed for Delco ignition systems for 20,000 Liberty engines, Mr. Hughes found that Deeds had made no recommendations for the placing of these orders and further that "while there had been a question as to whether the magneto or Delco system was preferable" it has lately developed that the use of the Delco is growing in favor.

The charges that Deeds acted as adviser to his ex-partner Talbott are based on correspondence showing that Deeds gave opinions of the Judge Advocate General to Talbott to guide him in the selection of appraisers of plants at the expiration of contracts and also informed him of the character of his superior officer, General Squier.

*The claim that he gave out false publicity developed through the issuance of an erroneous statement about airplane production by Deeds to the Committee on Public Information. The statement was to the effect that the first American-built battle planes were shipped to France Feb. 1, 1918. Secretary of War Baker, who authorized the statement, it was found, gave his authority for its publication, relying upon Deeds for its accuracy. These actions on the part of Deeds were termed "highly improper" by Mr. Hughes and in consequence of them he demanded the attention of the military authorities.*

The report deals at length with the earlier plans for airplane production, telling much that was told in the Senate report, but explaining in greater detail that many contradictory telegrams, signed "Pershing," but frequently sent by various other officers in France, delayed production in this country and caused much confusion.

For example, one cablegram on April 19, 1918, urged large production of single-seaters while another on May 4 disapproved single-seater production in the United States. As a result of the confusion, after much cabling, the authorities on this side were forced completely to disregard advices from abroad and make their own decisions in many cases.

There is considerable and strong censure in the report for the delay in the production of Handley-Page, Caproni and DeHaviland-9 planes. It is shown that as early as Feb. 20, 1918, Howard Coffin urged immediate quantity production of Capronis here to be assembled in Italy. On March 26 production of Capronis was again taken up, discussed and referred to the Chief Signal Officer for consideration. On April 2 the Italian Ambassador inquired if there was any plan for producing Capronis. On April 23 a verbal order was given the Fisher Body Corporation for 250 of these planes. On May 9 other arrangements were made with the Fisher company, and in June they received a contract for 500 planes.

"There appears to be no adequate reason," says the report, "for this long delay in putting the Caproni planes into production." As a result of the delays "nothing is left of last fall's program for service planes, save the DeH-4s."

*The Liberty engine is given high praise in the report, and foreign experts are quoted in substantiation of its success.*

In discussing the selection of contractors and the distribution of work, the report tells of many investigations, inspections and conferences between the aircraft authorities and the Singer Mfg. Co., of the excellent facilities of this concern and of the fact that it never received Government contracts, stating "in the light of the correspondence, no explanation has been given of the failure to enlist the important resources of the Singer company for the purposes of aircraft production."

CAUSES OF DELAY IN PRODUCTION WERE DUE, SAYS THE REPORT, TO LACK OF KNOWLEDGE AND

EXPERIENCE, DEFECTIVE ORGANIZATION IN THE SIGNAL CORPS, LACK OF INFORMATION AS TO EQUIPMENT FOR SERVICE PLANES, CHANGES IN DESIGN AND EQUIPMENT, CONDITIONS IN MANUFACTURING PLANES AND THE CHANGES IN THE LIBERTY ENGINE. "IT IS QUITE CLEAR," IT IS STATED, "THAT THE DUTY OF PROVIDING AN ADEQUATE ORGANIZATION FOR AIRCRAFT PRODUCTION WAS BEYOND THE COMPETENCY OF THE CHIEF SIGNAL OFFICER, WHO HAD NEITHER TRAINING NOR EXPERIENCE FOR SUCH A LARGE INDUSTRIAL ENTERPRISE."

The lack of airplane engineers was another serious obstacle, and the lack of organization and responsibility is pointed out. A letter from Archer A. Landon, Mr. Coffin's assistant, and at present in charge of aircraft production, is introduced in the report and tells of the various situations created by the "dilly-dallying" caused by the fact that *no one would assume the responsibility for the work he undertook.*

Complaints against the profits paid on both engine and plane manufacture under the cost-plus contract plan are frequent in the report. It is pointed out that the Dayton Wright Airplane Co. in a contract for DeH-4s was given a fixed profit of \$875 per plane, based on 12½ per cent of the bogey cost of \$7,000 while these planes actually cost under \$4,400, on which a fixed profit of 12½ per cent would have been about \$550. In addition, it is stated that the profits are not always based, as they should be, on the actual investments of the companies. The first bogey cost on the Liberty engines was fixed at \$6,087 and later reduced to \$5,000, on which basis a fixed profit of \$625 was arranged in contracts with the Packard, Lincoln and Nordyke & Marmon companies, and "even at this reduced bogey and percentage," says the report, "the profits allowed were very large." The Packard company, for example, delivered 3100 engines by Sept. 6, 1918, with profits amounting to \$1,937,500. In addition to the \$625 profit per engine, the actual cost of the engines at the Packard plant amounted to \$3,873 per engine for the first 600 and \$3,442 for the first 1200, making an additional profit of \$450 per engine through the contractor's percentage of saving.

The Ford Motor Co., it is expected, will be able to turn out these engines at \$3,200 per engine, and on its contract for 5000 engines will have received profits of \$625 per engine, plus \$450 per engine allowed by the saving clause, making a total of \$5,375,000 profits which can be earned on the complete contract. The Lincoln Motor Co. is mentioned as having a special feature in that it was a new organization with a newly established plant, devoted exclusively to Liberty engine manufacture, and its contract contains a clause allowing for depreciation of the company's heat-treating plant equal to the difference between its cost and value to the company at the termination of the contract, and that cost of its testing plant will be allowed as a part of the production cost of the engines to be manufactured, while the machinery and equipment used in the performance of the contract will be depreciated 40 per cent.

The Lincoln company received financial advances from the Government amounting to \$10,800,000 up to August, 1918. The cost of production on the first 600 engines was \$3,583, making it a reasonable assumption, says the report, that the average cost for the 6000 engines contracted for would be \$3,000; but on the basis of an actual cost of \$3,200 per engine, the report estimated the Lincoln company would have earned by January, 1919, on the delivery of 6000 engines, \$6,450,000, not including profits on spare parts of \$1,500,000, making a total of \$8,000,000. This is exclusive of the depreciations allowed, which in the testing and inspection facilities and special tools amounts to 100 per cent. The entire paid-in capital of the company, it is pointed out, in contrast to the estimated \$8,000,000 profit and depreciation allowances, amounts to \$850,000.

"It is pointed out very clearly," says the report, "that the company has provided an excellent plant for the manufacture of Liberty engines, and that ultimately its profit, after paying taxes, will represent only an equity in its plant, without any assured business, as it has been devoted to Government work. On the other hand, it may be said that there is a very liberal flat depreciation allowance on machinery, tools and equipment,

(Continued on page 750—40)

# Complete Text of Hughes Aircraft Report

Washington, D. C., Oct. 25, 1918.

## The Attorney General:

I have the honor to submit the following report of the Aircraft Inquiry:

The investigation has been concerned with aircraft production. Other activities relating to aviation, but not to production, have been touched upon incidentally. Thus, upward of thirty training or flying fields with numerous structures have been provided, and to meet other aviation needs a great variety of construction has been required, here and abroad. These enterprises, being aside from aircraft production itself, have not been the subject of this inquiry, save as transactions relating to Wilbur Wright Field and McCook Field have invited scrutiny by reason of the aircraft enterprises centered at Dayton, Ohio, and the activities of Edward A. Deeds and his former business associates.

Another governmental activity which does relate to aircraft production, but is conducted separately from the orders for airplanes and engines, is known as the sales department. The Government itself purchases large quantities of lumber, fabric, chemicals, etc., which it resells.

When these commodities are supplied by the Government to contractors, the sales department is credited and the items are transferred to the other appropriate accounts. The largest item of this sort is for spruce. The account of the sales department for the fiscal year ending June 30, 1918, shows that spruce orders amounted to \$76,211,360.35, on which there had been deliveries and payments aggregating \$6,357,853.83, leaving unfilled orders of \$69,853,506.52; and of the spruce delivered the Government had resold to the extent of \$3,679,155.95.

It appears that the Government had also (to June 30, 1918) invested in its cut-up plant at Vancouver, Wash., the sum of \$1,487,237.81. While to some extent testimony has been taken bearing on the spruce contracts, it became evident as the inquiry proceeded that it would be impossible to reach any satisfactory conclusion with respect to the transactions of the Spruce Production Division without a special inquiry on the Pacific Coast, which in view of the extent and character of the activities involved would probably take several months.

It has not been practicable to undertake this as yet, in view of the magnitude of the work involved in other branches of the investigation, and accordingly it has been left to be undertaken hereafter by the Department of Justice as it may be advised. For this reason, a report on the operations of the Spruce Production Division or of the Sales Department will not now be attempted. Also, in view of the importance of the present inquiry in its special relation to airplanes and airplane engines, transactions of the Balloon Division have not been examined.

Aside from these limitations, the inquiry has taken a wide range. It has been prosecuted without pause since it was begun in the latter part of May last. About 280 witnesses have been examined and over 17,000 pages of testimony have been taken.

The more important plants have been visited, and a large part of the testimony has been taken at these plants where books, records, employees and Government representatives have been available. To compass all the activities involved in aircraft production, reaching into a great variety of contracts and operations involving numerous plants and the expenditure of many millions of dollars, would require the constant efforts of a force of investigators for a year or more longer and also the services of an army of accountants charged with the responsibility of checking and auditing the work of the hundreds of Government representatives now supervising the contractors' accounts.

It is impossible, of course, to say what irregularities or offenses such a protracted inquiry would bring to light, but

the investigation has been sufficiently comprehensive to give, it is believed, a survey of the field as a whole and to disclose the facts bearing upon the serious charges which have been made.

In addition, and as a result of information received through this inquiry, there have been special proceedings before grand juries. Thus, on information of violations of the Sabotage Act at the Hammondsport (N. Y.) plant of the Curtiss Aeroplane & Motor Corp., the matter was examined by the Grand Jury and indictments were returned in the Western District of New York and there have also been indictments in the same district for violations of this Act at the North Elmwood plant, Buffalo, of the same corporation. There also has been a special investigation by the Grand Jury at Sacramento, with respect to conditions at the Liberty Iron Works.

It is manifestly impracticable to state the details of even the more important evidence, but the salient and controlling facts which have been elicited will be set forth, so far as this is deemed to be compatible with military exigency.

## FIRST APPROPRIATIONS AND EXPENDITURES

At the time of the time of the declaration of a state of war with Germany, April 6, 1917, the appropriations available for aircraft production were those applicable to the fiscal year ending June 30, 1917. By the Act of Aug. 29, 1916, the sum of \$14,281,766 was appropriated for the expenses of the Signal Service, with the proviso that not more than \$13,281,666 should be used for the purchase, manufacture, maintenance and operation of aircraft and of described vehicles necessary for the Aviation Section.

It was further provided that not to exceed \$50,000 should be used for the payment of all expenses in connection with the development of a suitable type of aviation motor and not more than \$500 should be used for the cost of special technical instruction of officers of the Aviation Section.

Of the total appropriation above mentioned the sum of \$4,500,000 was later (Act of May 12, 1917) made available for the establishment of aviation schools and experimental stations, and it was under this appropriation that Langley Field, Virginia, was acquired and developed.

The Act of Feb. 14, 1917, appropriated \$3,600,000 for aircraft, buildings for equipment, and other accessories necessary in the Aviation Section, for use in connection with sea-coast defenses.

The Act of May 12, 1917, appropriated for the expenses of the Signal Service, for the fiscal year ending June 30, 1918, the sum of \$11,800,000, with the proviso that not more than \$10,800,000 should be used for aircraft production, including experimentation, and for the buildings for equipment and personnel, and necessary accessories. The sum of \$43,450,000 was appropriated by the deficiency appropriation Act of June 15, 1917, of which \$31,846,067.16 became available, under the terms of the Act, for the fiscal year 1917-18.

Provision for an adequate aircraft program for the Army was not made until the passage of the Act of July 24, 1917, appropriating for aeronautical purposes the sum of \$640,000,000.

## STATEMENT FOR FISCAL YEAR JUNE 30, 1917, TO JUNE 30, 1918

The aggregate of all aeronautical appropriations which were available for the Army for the fiscal year ending June 30, 1918, were as follows:

Act of July 24, 1917.....	\$640,000,000.00
Other aeronautical appropriations.....	51,851,866.47

Total .....	\$691,851,866.47
-------------	------------------

The estimated obligations charged against these appro-

priations during the fiscal year amounted to \$933,948,959.03. To the extent of \$176,924,903.42, this excess represented obligations of the Sales Department already described, for which it was contemplated there would be reimbursement by resales. (Of this last-mentioned amount, there were reported as disbursed in the Sales Department (to June 30, 1918) that is, for deliveries of materials, \$25,966,739.95\* the resales amounting to \$19,008,150.26, and the balance representing assets on hand.) Exclusive of the obligations of the Sales Department, the estimated aeronautical obligations of the Government for the fiscal year 1917-1918 amounted to \$757,024,055.61. These obligations were calculated on estimated costs, and the excess over the total aeronautical appropriations (that is, over \$691,851,866.47) will largely be offset by savings on the estimated costs and by cancellations of orders.

#### Obligations Other Than for Airplanes and Engines

The estimated obligations for the Aviation Equipment Division covered not only Airplanes and Engines, but a variety of equipment and other essentials. Thus, the estimated obligations, charged against the \$640,000,000 appropriation, for Transportation including motor trucks, chassis, motor cycles, bicycles, etc., amounted to \$42,938,630.73; for General Equipment including various sorts of apparatus and supplies \$34,979,741.53; for Maintenance including maintenance of supply depots, planting of castor beans, etc., \$17,948,955.60; for Special Clothing for aviators, mechanics, etc., \$2,520,512.63; for Machine Guns, Ammunition and Bombs, \$29,249,033.29; for Acquisition of Plants, \$2,595,599.83 and for Miscellaneous Equipment, including various incidental expenses of officers, stations and schools, \$7,748,617.75.

There were also charged against the \$640,000,000 appropriation the estimated obligations of the Construction Division, embracing training fields and construction here and abroad, amounting to \$62,232,664.55; of the Balloon Division (covering balloons and accessories), \$16,910,891.20; of the Schools Division, \$1,016,223.48, and of the Finance Division (including the pay of Reserve Corps and of civilian employees, and the reserve for foreign expenditures), \$35,963,417.55. The various estimated obligations for similar purposes, other than for airplanes and engines, which were charged against the other aeronautical appropriations for the fiscal year 1917-1918, aggregated \$28,009,060.92.

Thus, out of the total estimated obligations (\$757,024,055.61) for all aeronautical purposes (exclusive of the Sales Department) the estimated obligations for purposes other than airplanes and engines aggregated \$282,113,349.06.

#### Obligations for Airplanes and Engines

The amount of the estimated obligations for airplanes and engines and spare parts of both (including experimental and development work) charged, to June 30, 1918, against the aeronautical appropriations for the fiscal year 1917-1918 was as follows:

Charged to the \$640,000,000 appropriation.....	\$457,379,122.15
Charged to other appropriations .....	17,531,584.40
Total .....	\$474,910,706.55

#### Actual Disbursements for All Aeronautical Purposes

It should be noted that the amounts above stated represent estimated obligations, not actual disbursements. Although obligations were incurred, payments were to be made only as payments were earned by performance of contracts. Payments prior to June 30, 1918, were made on vouchers for amounts represented as earned, but such payments were only a part of the estimated obligations, by reason of delays in production. Further payments should be made only as production goes forward and contracts are duly performed.

Thus, as against the total estimated obligations for aeronautical purposes aggregating \$933,948,959.03 (including the sales department), the disbursements reported down to June 30, 1918, amounted to the sum of \$430,234,316.99. Out of the \$640,000,000 appropriation, the total disbursements for the fiscal year for all aeronautical purposes (that is, embracing those apart from airplanes and engines, as well as for the latter) amounted to \$363,818,014.87;† and, according to the accounts of the Bureau of Aircraft Production there remained of this appropriation in the Treasury of the United States on June 30, 1918, the sum of \$276,181,985.13. According to the books of the Treasury Department, the unexpended

balance of the \$640,000,000 appropriation amounted on June 29, 1917, to \$304,478,211.70. The difference of \$28,296,226.57 is explained by the existence of unwithdrawn balances which had been allotted to the Quartermaster Corps and the Ordnance Department and by various credits pertaining to the month of June which were not received in the Bureau of Aircraft Production until July.

#### Actual Disbursements for Airplanes and Engines

The actual payments for the fiscal year 1917-1918 against the estimated obligations for airplanes and engines, and spare parts of both (including payments for experimental and development work) are reported by the Finance Division of the Bureau of Aircraft Production as amounting to \$155,535,946.41, as follows:

Disbursed from the \$640,000,000 appropriation.....	\$142,908,398.95
Disbursed from other appropriations.....	12,627,547.46

Total .....

These disbursements included not only payments to contractors for articles delivered or on account of work and materials, but also advances in the nature of loans to contractors, upon security, made by the War Credits Board, and, in addition, the payments which had been made for the manufacture of planes and engines overseas.

The payments for manufacture overseas amounted to \$25,605,074.31, as follows:

Cash remittances to overseas disbursing officers for payment on overseas contracts for airplanes and engines .....	\$16,600,000.00
Paid on purchase of materials, supplies, etc. purchased by United States for shipment abroad to be used in overseas manufacture of airplanes and engines .....	*9,005,074.31
Total .....	\$25,605,074.31

The unpaid balances of advances to contractors (whose contracts are embraced in the obligations for airplanes and engines above described), these advances being repayable to the Government, amounted on June 30, 1918 (exclusive of interest) to \$21,491,551.14. The principal contractors who have received these advances are specified below:

Contractor	Advances Authorized	Advances Made	Balance Unpaid June 30, 1918 (Without Interest)
Curtiss Aeroplane & Motor Corp. ....	\$8,000,000	\$8,000,000	\$5,561,645.94
Dayton Wright Airplane Co. ....	2,500,000	2,000,000	1,405,222.57
Duesenberg Motors Corp. ....	1,650,000	1,650,000	1,632,447.97
Fisher Body Corp. ....	2,000,000	2,000,000	1,944,933.33
Lincoln Motor Co. ....	6,500,000	6,500,000	6,255,392.00
Nordyke & Marmon Co. ....	2,000,000	2,000,000	2,000,000.00
Packard Motor Car Co. ....	5,000,000	5,000,000	1,731,232.00
Trego Motors Corp. ....	315,000	285,000	281,696.75
Willys-Overland Co. ....	2,500,000	2,500,000	451,861.25
Various other contractors.....			227,120.88
Total .....			\$21,491,551.14

The amounts paid, to June 30, 1918, on account of experimental and development work on airplanes and engines, amounted to \$1,697,830.19, of which the principal items are these:

Expenditures of Experimental Station at McCook Field	\$974,300.20
Director, Bureau of Standards.....	64,077.33
Department of Agriculture.....	34,540.82
Packard Motor Car Co.....	249,159.10
†Dayton Wright Airplane Co.....	48,120.39
Dayton Metal Products Co.....	66,097.14
Miscellaneous payments .....	261,535.21
Total .....	\$1,697,830.19

Deducting these advances, and the payments of experimental and development work, the disbursements to the end of the fiscal year, June 30, 1918, for airplanes and engines, and their parts, manufactured or in process of manufacture in the United States amounted to \$106,741,490.77, as follows:

Total disbursed for airplanes and engines.....	\$155,535,946.41
Less—	
For overseas manufacture.....	\$25,605,074.31
For advances to contractors.....	21,491,551.14
For experimental and development work .....	1,697,830.19
Disbursed on account of production in United States.....	\$106,741,490.77

\*Corrections on further accounting raised this amount to \$26,557,706.87.

†Subject to correction by addition of \$590,966.62 for Sales Department.

\*This includes the compensation of the purchasing agent, The J. G. White Engineering Corporation, amounting to 3 per cent of the purchases, or \$262,662.02.

†Other vouchers allowed before June 30, 1918, but not paid until later, \$89,630.52.

AIRPLANES AND ENGINES DELIVERED DURING  
FISCAL YEAR ENDING JUNE 30, 1918

The reported deliveries of airplanes and engines made prior to June 30, 1918, are as follows:

## Airplanes

Elementary Training Planes		
JN4-D .....	2972	
SJ-1 .....	1600	4572
Advanced Training Planes		
JN4-H .....		
Training .....	402	
Gunnery .....	321	
JN6-HB .....	100	
S4-B .....	100	
S4-C .....	78	
Penguin .....	50	1046
Combat and Bombing Planes		
DeH-4 .....	529	
Bristol Fighter .....	24	558
Total planes .....		6171

## Engines

Elementary Training		
OX-5 .....	5474	
A7a .....	2188	7662
Advanced Training		
Hispano 150 hp. ....	2188	
Gnome 100 hp. ....	209	
Le Rhone 80 hp. ....	68	
Lawrence 28 hp. ....	114	2579
Combat and Bombing		
U. S. 12 Cylinder (Army Type) .....	1615	
U. S. 12 Cylinder (Navy Type) .....	775	
Hispano 300 hp. ....	2	2392
Total engines .....		12633

For some of the units thus delivered, payments had not yet been made at the close of the fiscal year. The payments to June 30, 1918, covered about 5530 of the airplanes delivered and about 9750 of the engines delivered. In addition, there had been deliveries of various planes and engine parts, and the greater part of these were also covered by the payments above mentioned. And there were also large payments to contractors under cost-plus contracts for labor, materials and overhead charges in connection with work in process.

## Allocation of Payments to June 30, 1918

The payments for the production of airplanes and engines, and parts, were made under two classes of contracts, (1) fixed-price and (2) cost-plus contracts:

Payments under fixed-price contracts .....	\$57,193,621.06
Payments under cost-plus contracts .....	49,547,869.71
	<u>\$106,741,490.77</u>

## Fixed-Price Contracts

In the case of payments under fixed-price contracts, the payments presupposed delivery to and acceptance by the Government of the articles contracted for. Most of the JN training planes, 150 of the Standard J-1 training planes, metal parts for Handley-Page planes, all the engines for the elementary training planes, and 1500 of the Hispano-Suiza 150-hp. engines are embraced in the orders placed on a fixed-price basis. Large numbers of parts of planes and engines were ordered on the same basis.

The payments under fixed-price contracts are shown to have been distributed as follows:

For engines and their parts .....	\$23,216,930.28
For airplanes and their parts .....	33,976,690.78
	<u>\$57,193,621.06</u>

## Cost-Plus Contracts

The cost-plus contracts for engines and parts related to the Liberty engines (U. S. 12s), most of the Hispano-Suiza, and the Le Rhone, Gnome and Bugatti engines. Among airplanes, 1450 of the Standard J-1 elementary training planes, the De Havilland 4 and Bristol service planes, and the Handley-Page wood parts, were under cost-plus contracts. The following is the distribution of payments under cost-plus contracts to June 30, 1918:

For engines and their parts .....	\$28,348,487.44
For airplanes and their parts .....	21,199,382.27
	<u>\$49,547,869.71</u>

These payments (being exclusive of advances in the nature of loans) embraced (1) cost of special tools and "increased facilities" owned by the Government but located in contractors' plants, (2) fixed profits on completed units delivered, (3) royalties on completed units delivered, (4) cost of manufacture of completed units delivered, and (5) payments for

work in process, that is, for materials, labor and overhead expense applicable to units in course of production. The distribution of these payments to June 30, 1918, is:

Special tools and increased facilities owned by Government .....	\$6,840,971.70
Fixed profits on completed units delivered .....	3,279,028.18
Royalties on completed units delivered .....	374,986.40
Payments to June 30, 1918, under cost-plus contracts for labor, materials and overhead charges applicable to delivered units and to work in process .....	<u>39,052,883.43</u>
	<u>\$49,547,869.71</u>

It is impossible at this time, by reason of the state of the accounts, to divide the last item covering cost of manufacture so as to give separately the manufacturing cost (exclusive of fixed profits and royalties) of the units which had been delivered and the cost of work in process at the close of the fiscal year.

APPROPRIATIONS AND OBLIGATIONS FOR FISCAL  
YEAR JUNE 30, 1918, TO JUNE 30, 1919

## Continuance of Prior Appropriations

The Act of July 9, 1918, making appropriations for the fiscal year 1918-1919, continued the prior appropriation of \$640,000,000, and other aeronautical appropriations, thus making them available for the present fiscal year and for the payment of obligations incurred prior to the passage of the Act. Under this provision the production orders given in the last fiscal year, which remain uncanceled, will be continued and payments will be made in accordance with the terms of the existing contracts as production progresses.

## New Appropriations

The Act of July 9, 1918, also made a new appropriation for the Air Service of \$884,304,758. This appropriation is available for the purchase, manufacture, maintenance, repair and operation of airships, war balloons and other aerial machines, with equipment, aviation stations, schools and fields; for the expenses of officers, enlisted men and civilian employees; and also for training, experimental work, creation, expansion, acquisition and development of plants, etc. Of this amount, there has been apportioned for Air Service Production the sum of \$760,000,000, of which \$200,000,000 has been set aside for airplanes, their spare parts, instruments and accessories, \$250,000,000 for engines, their repair parts, instruments and accessories, and \$200,000,000 for foreign expenditures. Various items for balloons, oils, gases and chemicals, transportation, plants, miscellaneous equipment and supplies, experimentation, and pay of Reserve Corps and civilians make up the remainder.

Against this new appropriation, thus apportioned, the obligations incurred to Sept. 30, 1918 (exclusive of the Sales Department) amounted to \$151,580,503.35, of which \$21,603,470.90 is for airplanes, their spare parts, etc., and \$102,746,372.91 is for engines, their repair parts, etc. The total payments against the new obligations amounted, to Sept. 30, 1918, to \$3,670,707.66 (exclusive of foreign expenditures and transfers to other departments), leaving then unexpended of the new appropriation of \$760,000,000, apportioned to Air Service Production, the sum of \$756,329,292.34.

## Payments Since June 30, 1918, and Total Payments to Date

The last financial reports available are of Sept. 30, 1918. The disbursements to that date which were made after June 30, 1918, for all aeronautical purposes and were chargeable to the appropriations for the prior fiscal year (continued as above stated) are as follows:

Disbursed from the \$640,000,000 appropriation (Act of June 24, 1917) .....	\$128,265,038.31
Disbursed from other aeronautical appropriations .....	<u>7,250,916.36</u>

Total disbursed since June 30, 1918, under prior appropriations for aeronautical purposes .....

\$135,515,953.67

The total disbursements for aeronautical purposes from June 30, 1918, to September 30, 1918, are in the aggregate:

Under appropriations prior to June 30, 1918 .....	\$135,515,953.67
Under appropriations after that date, as above .....	<u>3,670,707.66</u>

Total .....

\$139,186,661.33

These disbursements for all aeronautical purposes can not at present be apportioned so as to show separately the amounts disbursed since June 30, 1918, for airplanes and engines and parts.

## Deliveries to October 11, 1918

The total deliveries of airplanes and engines (exclusive of spare parts) to Oct. 11, 1918, appear, by the Government's reports, to be as follows:

**Training Planes**

	Since June 30, 1918	Total to Oct. 11, 1918
JN-4D .....	615	3587
SJ-1 .....		1600
JN-4H and JN-6H .....	609	1432
S4-B .....		100
S4-C .....	225	298
Penguin .....	245	295
E-1 .....	12	12
	1706	7324

**Engines for Training Planes.**

OX-5 .....	2532	8006
A-7a (Hall-Scott) .....	62	2250
Gnome 100 H.P. ....	69	278
LeRhône 80 H.P. ....	679	747
Hispano 150 H.P. ....	824	3012
Lawrence .....	328	442
	4494	14,735

**Service Planes.**

DeHaviland-4s .....	1821	2350†
Handley - Page (parts 85% complete) .....	100*	100
Le Pere .....	5	5
SE-5 .....	2	2
	1928	2457

**Engines for Service Planes**

Liberty (U.S.)-12s .....	7299	9689†
Hispano 180 H.P. ....	242	242
Hispano 300 H.P. ....	3	5
Bugatti .....	1	1
	7545	9937

\*25 sets of wooden parts and no metal parts delivered to June 30, 1918.

†Since the above was prepared information has been received that, to Oct. 18, 1918, 2556 DeHaviland-4s and 10,568 Liberty (U.S.)-12s have been delivered.

**PAYMENTS FOR AIRPLANES CONDEMNED****Standard J-1 Training Planes**

This type of plane was condemned as dangerous, in June, 1918, because of the unsuitability of the motor (Hall-Scott, A7a) used with it. There were 1600 of these SJ-1 planes ordered and delivered, and all deliveries had been made prior to June 30, 1918. The entire amount disbursed for these planes and their spare parts to Sept. 30, 1918, the date of the last financial statement, is \$11,027,733.61, of which \$8,593,576.11 was under cost-plus contracts.

There were 2250 A7a engines ordered for these planes all of which, with parts, have been delivered. The amount disbursed for these engines, and parts (exclusively under fixed-price contracts) to Sept. 30, 1918, amounted to \$6,487,134.75.

The aggregate cost of the SJ-1 planes with the A7a engines with spare parts, to Sept. 30, 1918, amounted to \$17,514,868.36.

There appears to have been no defect in the SJ-1 plane itself, and there is an expectation that it may be utilized by the installation of another engine. The cost of adapting these planes to such an installation may amount to \$2,000 a plane.

What salvage may ultimately be gained in this way, or on the A7a engines, cannot now be determined.

**Bristol Fighters**

The Bristol Fighter was condemned as unsafe in July, 1918. A contract for 2000 of these planes and for 1200 sets of spare parts had been placed with the Curtiss Aeroplane & Motor Corp. on a cost-plus basis at an estimated cost of \$19,190,100. Orders were also given to the Hayes-Ionia Co. and to the Lewis Spring & Axle Co., each for 400 sets of spare parts, at the estimated cost of \$1,890,000, or \$3,780,000 in all. The estimated cost of the Bristol planes and spares was thus \$22,970,100.

Only 27 had been delivered prior to cancellation, but there was a large amount of work in process. The amount shown by the accounts of the Bureau of Aircraft Production to have been paid on these contracts to Sept. 30, 1918 (exclusive of "increased facilities" owned by the Government), is about \$2,350,000. Taking the materials purchased for the Bristols, the labor and estimated overhead charges, it would appear that the total amount expended by the Curtiss Co. in the course of the production of the Bristols was about \$3,000,000. This does not include any claim for damages for the cancellation of the contract. The Finance Division of the Bureau of Aircraft Production makes a general estimate (which includes unpaid vouchers and possible claims for damages growing out of the cancellation of contracts) that the aggregate cost of the Bristol will amount to about \$6,500,000. What salvage there may be on the materials cannot now be determined.

The Liberty engines intended to be used in the Bristols can be utilized in other planes.

On this estimate, the cost to the Government of the SJ-1

planes (with engines), and on the Bristol planes, subject to reduction by whatever salvage there may be, amounts to \$24,000,000.\*

\*Further information has been received that a contract is contemplated under which about \$3,500,000 of Bristol parts may be used in a new type of plane, which, if successful, would reduce the estimated loss on the Bristols to \$3,000,000 and the total loss on SJ-1s and Bristols, subject to salvage on the SJ-1s, to \$20,500,000.

**SECOND. RESPONSIBLE OFFICERS AND ADVISORY BOARDS**

By the Act of July 24, 1917, full authority was given to the President to provide, through the War Department, for the purchase, manufacture, maintenance and operation of all types of aircraft, with all necessary equipment.

**Signal Corps**

Under the Secretary of War, the authority to establish the aircraft program and the control and administration of matters relating to aircraft production for the Army were vested in the Chief Signal Officer, Brigadier-General George O. Squier. It was under his direction that the organization of the Aviation Section of the Signal Corps, with its various departments of production, supply, inspection and accounting, was effected. The matter of aircraft production was intrusted to the Equipment Division, which was organized on Aug. 2, 1917.

Edward A. Deeds was made Chief of this Division with Sydney D. Waldon as his assistant. At the same time Robert L. Montgomery was made Chief of the Finance and Supply Division. There was a reorganization on Aug. 29, 1917, by which these two divisions were abolished and the functions of both were transferred to a new Equipment Division with Edward A. Deeds in charge.

Robert L. Montgomery was made the head of the Finance Department of the Equipment Division. Deeds, Montgomery and Waldon had been members of the Aircraft Production Board and in or about August, 1917, they were commissioned with the rank of Colonel.

Thus, Colonel Deeds as the head of the Equipment Division had direct charge, under the Chief Signal Officer, of all matters relating to aircraft production. On Jan. 14, 1918, Colonel Deeds became Industrial Executive in the Executive Division of the Signal Corps and was succeeded by Colonel Montgomery as head of the Equipment Division, but despite the change in technical relation it is apparent that Colonel Deeds remained in practical charge, under the Chief Signal Officer, of production. In February, 1918, William C. Potter became the head of the Equipment Division and remained in this position until the passage of the Act of May 20, 1918.

**Bureau of Aircraft Production**

By order of the President, dated May 20, 1918 (promulgated May 24, 1918) the Chief Signal Officer was put in charge of military signal duties, not connected with the Aviation Section; General W. L. Kenly was appointed Director of Military Aeronautics and charged with the duties which had formerly pertained to the Aviation Section, except so far as they related to aircraft production, and for the latter purpose the executive agency known as the Bureau of Aircraft Production was established. John D. Ryan was appointed head of this Bureau and thus became Director of Aircraft Production, Mr. Potter taking the post of Assistant Director.

**ADVISORY BODIES****National Advisory Committee for Aeronautics**

By the Act of March 3, 1915, an Advisory Committee for Aeronautics was established to consist of two members from the War Department, two from the Navy Department, a representative each of the Smithsonian Institution, of the United States Weather Bureau, and of the United States Bureau of Standards, together with not more than five additional persons qualified as experts. The prescribed duty of the Committee was to supervise and direct the scientific study of the problems of flying with a view to their practical solution. This body has been continuously maintained; it has examined numerous inventions and has been engaged in scientific study. But it has had nothing to do with the formulation of the aircraft program or with decisions as to the types of planes or engines selected for production.

The Committee was also active in securing the adjustment reflected in what is known as the cross-license agreement for the payment of royalties for the use of patented inventions pertaining to aircraft.

**Joint Army and Navy Technical Aircraft Board**

This Board was constituted in the early part of May, 1917. It was composed of officers of special qualifications by reason

of scientific study and experience, who were designated by the Secretary of War and the Secretary of the Navy respectively. The declared purpose was to "standardize, so far as possible, the designs and general specifications of aircraft except Zeppelins." The Board has been in continuous existence and has made various recommendations. These, however, have not been controlling and the Board has had no authority to enforce its views.

#### Aircraft Production Board

The Aircraft Production Board was created in May, 1917, pursuant to a resolution of the Council of National Defense. Its function was solely advisory. The initial steps in organization were taken under the authority of the Council of National Defense by Howard E. Coffin, who became Chairman of the Board and selected the civilian personnel consisting of Edward A. Deeds, Sidney D. Waldon and Robert L. Montgomery. Mr. Coffin—Vice-President of the Hudson Motor Car Company—was a member of the Advisory Commission of the Council of National Defense. Mr. Deeds had been engaged in manufacturing enterprises at Dayton; in April, 1917, he had been appointed a member of the Munitions Standards Board and placed on the Sub-Committee on Fuses and Detonators. Mr. Waldon had formerly been a Vice-President of the Packard Motor Car Company. Mr. Montgomery was a member of the firm of Montgomery, Clothier & Tyler, bankers and brokers, of Philadelphia. In addition to the four civilian members, the Chief Signal Officer and Rear Admiral D. W. Taylor, Chief of the Bureau of Construction, were appointed members of the Board representing the Army and Navy respectively.

While the Aircraft Production Board had no authority to commit the Government, the Board was continuously active in the formulation of programs and the adoption of resolutions of advice. Numerous contracts for airplanes and engines were placed upon its recommendation. When the Equipment Division of the Aviation Section of the Signal Corps was organized in August, 1917, the work of the Board became of less actual importance, though it was still conspicuous in routine. Colonel Deeds, Colonel Waldon and Colonel Montgomery now had executive duties in the Equipment Division under the Chief Signal Officer and for the most part the recommendations relating to the Army aircraft program naturally followed the views of the Army officers who were in actual control. Similarly, the recommendations relating to the Navy reflected Navy proposals. The Board, however, afforded a valuable opportunity for the interchange of opinion and the unification of effort.

#### Aircraft Board

The Aircraft Board, superseding the former organization, was established by the Act of Oct. 1, 1917. This was composed of nine members, including the Chief Signal Officer (Major-General Squier) and two other representatives of the Army, and the Chief Constructor of the Navy (Rear Admiral Irwin) and two other naval officers. For the Army, the Secretary of War designated Colonel Deeds and Colonel Montgomery; and for the Navy, the Secretary of the Navy designated Captain N. E. Irwin and Lieut.-Com. A. K. Atkins. The civilian members, appointed by the President with the advice and consent of the Senate, were Mr. Coffin (Chairman), Richard F. Howe (who had been connected with the International Harvester Company) and Harry B. Thayer (President of the Western Electric Company),—the last-named being appointed in February, 1918.

The Act creating the Aircraft Board empowered it under the direction and control of the Secretary of War and the Secretary of the Navy.

to supervise and direct, in accordance with the requirements prescribed or approved by the respective departments, the purchase, production, and manufacture of aircraft, engines and all ordnance and instruments used in connection therewith, and accessories and materials therefor, including the purchase, lease, acquisition or construction of plants for the manufacture of aircraft, engines and accessories; provided, that the Board may make recommendations as to contracts and their distribution in connection with the foregoing, but every contract shall be made by the already constituted authorities of the respective departments.

It was also provided that

except upon the joint and concurrent approval of the Secretary of War and the Secretary of the Navy there shall not be established or maintained under the Board any office or organization duplicating or replacing, in whole or in part, any office or organization now existing that can be properly established or maintained by appropriations made for or available for the military or naval service.

In February, 1918, Acting Judge Advocate General S. T. Ansell gave an opinion to the effect that the provisions of the Act should be construed to contemplate "only advisory or recommendatory functions". Thereupon, the Chief Signal Officer, in an order approved by the Secretary of War and the Sec-

retary of the Navy, defined the duties of the Aircraft Board as follows:

- a. To act as a clearing house between the General Staff and the Signal Corps for all matters pertaining to raw materials for foreign governments for the production of aircraft, the Equipment Division of the Signal Corps to act as purchasing agency.
- b. To act as a clearing house between the General Staff and the Signal Corps for all information in relation to requirements of foreign governments for aircraft to be manufactured in the United States.
- c. To act as a clearing house for all information as to requirements as between the army and navy for aircraft and raw materials.
- d. To study the requirements of the army and navy as regards combat and training planes. To study types with the Technical Divisions of the army and navy to the end that recommendations be made that given types be placed with industrial plants best fitted to undertake their manufacture. The Aircraft Board shall have no direct communication with manufacturing plants, except through the medium of the procurement divisions.
- e. As a result of above studies the Aircraft Board may recommend that preparations be made for production before actual contracts are made.
- f. To recommend the placing of experimental contract.
- g. All programs should be made up by the Board from information which shall be furnished by the proper army and navy military and naval branches, on the one hand, and the Equipment and Production Divisions of the army and navy on the other. All foreign cables respecting aircraft production should be cleared through the Board.
- h. The Aircraft Board should be the instrumentality through which contact is made on matters of large policy with other bodies such as Shipping Board, Allied representatives, etc.

Despite the broad language of the Act of Congress as to the power which might be committed to the Board under the direction of the Secretary of War and the Secretary of the Navy, it will be observed that this executive order had the effect of greatly limiting the authority of the Board and that it was denied even the right to hold "direct communication with manufacturing plants". It was further provided that all programs should be made up by the Board "from information which shall be furnished by the proper Army and Navy Military and Naval Branches on the one hand and the Equipment and Production Divisions of the Army and Navy on the other". The manifest purpose was to leave no question that the actual control of aircraft production rested with the Military and Naval officers.

The Aircraft Board held frequent sessions, and continuously made recommendations upon which action was taken and contracts placed, the service of the Board being virtually that of a clearing house for proposals which generally emanated from the responsible authorities and in all cases were dependent upon the action of these authorities for their final approval and execution.

#### THIRD. PERSONAL INTERESTS

There are no common law offenses against the United States, and a charge of crime under Federal law must rest exclusively upon the violation of a Federal criminal statute (United States vs. Eaton, 144 U. S. 677, 687; United States vs. George, 228 U. S. 422).

The applicable statutes of the United States, dealing with the question of personal interest of officers and agents of the Government in Government contracts are the following:

(1) Section 41 of the Criminal Code of the United States, formerly Section 1783 of the Revised Statutes, provides:

Sec. 41. No officer or agent of any corporation, joint stock company or association and no member or agent of any firm or person directly or indirectly interested in the pecuniary profits or contracts of such corporation, joint stock company, association, or firm shall be employed or shall act as an officer or agent of the United States for the transaction of business with such corporation, joint stock company, association, or firm. Whoever shall violate the provision of this section shall be fined not more than two thousand dollars and imprisoned not more than two years.

Under this statute, it is not enough that an interested person merely recommends or advises transactions with the Government. To constitute a violation of the statute, the interested person must "be employed" or "act as an officer or agent of the United States for the transaction of business with such corporations," etc.

(2) Section 3 of the Act of Aug. 10, 1917 (Food and Fuel Control Act) provides:

Sec. 3. That no person acting either as a voluntary or paid agent or employee of the United States in any capacity, including an advisory capacity, shall solicit, induce, or attempt to induce any person or officer authorized to execute or to direct the execution of contracts on behalf of the United States to make any contract or give any order for the furnishing to the United States of work, labor, or services, or of materials, supplies, or other property of any kind or character, if such agent or employee has any pecuniary interest in such contract or order, or if he or any firm of which he is a member, or corporation, joint-stock company, or association of which he is an officer or stockholder, or in the pecuniary profits of which he is directly or indirectly interested, shall be a party thereto. Nor shall any agent or employee make, or permit any committee or other body of which he is a member, to make, or participate in making any recommendation concerning such contract or order to any council, board, or commission of the United States, or any member or subordinate thereof, without making to the best of

his knowledge and belief a full and complete disclosure in writing to such council, board, commission, or subordinate of any and every pecuniary interest which he may have in such contract or order and of his interest in any firm, corporation, company, or association being a party thereto. Nor shall he participate in the awarding of such contract or giving such order. Any willful violation of any of the provisions of this section shall be punishable by a fine of not more than \$10,000, or by imprisonment of not more than five years, or both; *Provided*, That the provisions of this section shall not change, alter or repeal section forty-one of chapter three hundred and twenty-one, Thirty-fifth Statutes at Large.

This section covers those who act in an advisory capacity. It has no application to transactions occurring before its passage.

It is apparent that the section was guardedly drawn and its limitations should be noted. The first sentence of the section applies to interested persons only where they "solicit, induce, or attempt to induce" any person or officer, who is "authorized to execute, or to direct the execution of contracts," to make any contract or give any order for labor, services, materials, etc. The use of different expressions in the different clauses of the section suggests possible shades of meaning. The act of recommending does not come within the first sentence unless it is found to amount to "soliciting," "inducing" or "attempting to induce," nor does the first sentence cover solicitations addressed to others than the persons or officers duly authorized to make the contracts or give the orders.

The second sentence relates to "recommendations" by interested persons, but it is limited to recommendations made "to any council, board, or commission of the United States, or any member or subordinate thereof" in the absence of the disclosure described. Apparently this sentence does not cover recommendations made to individual officers acting under the authority conferred upon them by law, who are not members or subordinates of a "council, board, or commission."

The third sentence provides that the interested person shall not "participate in the awarding of such contract or giving such order." This would seem to relate to those who take part in the actual awarding of the contract or giving of the order and not to those who act in an advisory capacity only.

The section concludes with the proviso that its provisions shall not alter or repeal Section 41 of the Criminal Code above quoted.

To come within these statutes an interested person must either (1) act as an officer or agent of the Government for the transaction of business with the concern in which he is interested, or (2) solicit, induce or attempt to induce the person or officer, who is authorized to execute or direct the execution of contracts, to make a contract with or give an order to, the concern to which the interest relates, or (3) take part in a recommendation to a "council, board, or commission" or subordinate or members thereof, without the disclosure stated, or (4) participate in the award of the contract or giving of the order.

In connection with these statutes attention may be called to the following provision, which appears as a rider in the Appropriation Act of March 3, 1917, immediately following an appropriation for the distribution of documents (39 Stat. p. 1106):

*Provided*, That on and after July 1, 1919, no government official or employee shall receive any salary in connection with his services as such an official or employee from any source other than the Government of the United States, except as may be contributed out of the Treasury of any State, county or municipality, and no person, association or corporation shall make any contribution to, or in any way supplement the salary of, any government official or employee for the services performed by him for the Government of the United States. Any person violating any of the terms of this proviso shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than \$1000 or imprisonment for not less than six months, or by both such fine and imprisonment as the court may determine.

It will be noted that this provision, enacted in March, 1917, is not to be operative until July 1, 1919. It may be contended with force that this constitutes a legislative declaration, by implication, that the action described by the provision, that is, the mere supplementing of the pay of Government officials by private contributions, should not be deemed contrary to law prior to the date fixed.

## INDIVIDUAL RELATIONS OF OFFICIALS

### Present Bureau of Aircraft Production

John D. Ryan—William C. Potter

There is no suggestion, and no evidence, that either Mr. Ryan or Mr. Potter has taken any part in Government transactions with any concern in which he has a personal interest.

### Members of the Aircraft Board

The relations of the members of this board, who received commissions in the army are stated hereafter. As to Mr.

Coffin, and as to the naval officers who were members of this board, it should be said that there is no evidence that any one of them has taken any part in transactions or recommendations relating to any corporation, firm or association in which he has an interest. Disclosures of interest in particular corporations have been made from time to time by Mr. Howe and Mr. Thayer and with respect to such corporations it appears that they have abstained from participating in the recommendations made by the board; except that Mr. Howe in his disclosure of interest to the board on Feb. 12, 1918, stated that he was interested in a corporation holding preferred stock of the Willys-Overland Co., and that he was present at the meetings of the board on Dec. 7 and Dec. 18, when resolutions involving a contract with that company were passed, but that he was not aware of such financial interest at those times. As the board acts in an advisory capacity simply, Sec. 41 of the Criminal Code cannot be regarded as applicable, and the limitation of Section 3 of the Act of Aug. 10, 1917, with respect to mere recommendations, have already been pointed out.

### Officers of the Signal Corps Formerly in Control of Aircraft Production

#### (1) The Chief Signal Officer

It does not appear that General Squier had any interest in any corporations or concerns transacting business with the Signal Corps. The defects in the organization, which was created under his direction for the purpose of aircraft production, are matters distinct from any question of personal interest and will be considered in another division of this report.

#### (2) Colonel Edward A. Deeds

The charges pertaining to personal interest in Government contracts relate particularly to Colonel Edward A. Deeds and grow out of the highly suggestive transactions with his former business associates at Dayton. These transactions have been subjected to careful scrutiny.

Colonel Deeds was born near Granville, Ohio, on March 12, 1874. There is testimony that he once said that his name originally was "Dietz." No public record has been found to this effect. Colonel Deeds denies making the remark attributed to him and states that his family has borne the name of Deeds for at least four generations—his great-grandfather of that name coming from Pennsylvania.

For many years Colonel Deeds was an officer of the National Cash Register Co., and was one of several connected with that organization who were indicted in the Federal District Court for the Southern District of Ohio in 1912, for violation of the Sherman Anti-Trust Act. Upon the trial, Deeds, with other defendants, was convicted, but this conviction was set aside by the Circuit Court of Appeals (*Patterson v. United States*, 222 Fed. 599) and the prosecution went no further.

At the time of our entry into the war Mr. Deeds had large business interests at Dayton. His intimate business associates were Charles F. Kettering and H. E. Talbott. Mr. Deeds and Mr. Kettering (an inventor and engineer of ability) have been jointly associated in many enterprises with equal shares, it being their policy to organize corporations and to take their respective interests in stocks.

Mr. Deeds has supplied the financial talent and Mr. Kettering, who is without any aptitude for business details, the engineering skill. They have had, and still have, a common agent of a highly confidential sort, George B. Smith of Dayton, who holds the power of attorney of each, keeps their respective books, has charge of their bank accounts, signs their checks and generally looks after their financial affairs. They are still associated in various undertakings, and their relations are of the most intimate character.

In 1904 Kettering was employed in the National Cash Register Co. as a designer in the engineering department, and later he became associated with Deeds in the development of what is known as the Delco ignition system for automobiles. In the course of this development Deeds and Kettering organized the Dayton Engineering Laboratories Co., known as the Delco company. The enterprise was successful and the common stock was sold by Deeds and Kettering in 1916 to the United Motors Corp. for several million dollars in cash and certain shares of stock. Deeds and Kettering each retained a few shares of preferred stock; Deeds continued as president of the corporation, with a salary of \$60,000 a year, and Kettering as vice-president with a salary of \$50,000.

In April, 1915, Deeds, Kettering, H. E. Talbott, Sr., and his son, H. E. Talbott, Jr., organized the Dayton Metal Products Co. with a capital stock of \$200,000. The stock was held as follows: Talbott, Sr., 900 shares; Deeds, 500

shares; Kettering, 499 shares; Talbott, Jr., 99 shares; Charles H. Mead, 1 share, and George B. McCann, 1 share.

Prior to our entry into the war, this company had profitable fuse contracts with the British Government and had accumulated a considerable surplus. It appears that in the spring of 1917 both Deeds and Talbott were appointed on the Sub-Committee on Fuses and Detonators of the Munitions Standards Board. In 1916 the company had a contract with the Navy Department for fuses, and it received other fuse contracts from the Navy and the Ordnance Department of the Army in 1917.

As vice-president of this company Deeds had a salary of \$25,000 a year. The relation of the Dayton Metal Products Co. to aircraft production is that this company, in the latter part of the year 1917, acquired all the stock (save four qualifying shares) of the Dayton Wright Airplane Co., and also has sub-contracts for metal parts with contractors making airplanes and engines. The Dayton Metal Products Co. also subscribed and paid for 1000 shares (par value \$100,000) of the stock of the Lincoln Motor Co., which was organized to build Liberty engines, and has a paid-up capital stock of \$850,000.

In September, 1916, Deeds and Kettering organized the Domestic Building Co. of Dayton, for the purpose of erecting and financing plants for the use of various companies. The capital stock is now \$1,000,000, of which all but four qualifying shares are held by Deeds and Kettering in equal parts. This company owned the land and erected the building acquired by the Dayton Wright Airplane Co. for its principal airplane plant.

On April 9, 1917, the Dayton Wright Airplane Co. was incorporated with a capital stock of \$500,000 by Deeds, Kettering, H. E. Talbott and H. E. Talbott, Jr., in conjunction with Orville Wright. They had taken over the former Wright organization and thus had started an airplane enterprise at Dayton in a small way in the summer of 1916.

The larger enterprise of the Dayton Wright Airplane Co. was launched about the time of our entry into the war, manifestly with the expectation of obtaining Government contracts. While Deeds was one of the incorporators, he did not become a stockholder, the subscriptions for the first 5000 shares being as follows: H. E. Talbott 1990 shares, C. F. Kettering 2000 shares, H. E. Talbott, Jr., 990 shares, George H. Mead 10 shares, and C. A. Craighead 10 shares. In August, 1917, the capital stock was increased to \$1,000,000 (\$600,000 common and \$400,000 preferred).

The new common stock was taken by Messrs. Talbotts and Kettering in the proportion of two-fifths, two-fifths and one-fifth. There were early negotiations for a Government contract and as early as June 12, 1917, a contract with the company was recommended by the Aircraft Production Board. The contract was executed on Aug. 17, 1917 (under date of Aug. 1, 1917) and was for 400 Standard J-1 training planes at the fixed price of \$6,500 each.

For this, there was substituted the contract dated Sept. 7, 1917, which was also recommended by the Aircraft Production Board and was approved by General Squier. This contract was for 400 Standard-J airplanes, 2000 DeHaviland-9s and 1500 Martinsydes with spare parts. By later modifications the Martinsydes and DeHaviland-9s were omitted and provision was made for 4000 DeHaviland-4s.

These contracts were on a cost-plus basis, the estimated amount involved being upward of \$30,000,000. There was to be a fixed profit of \$620 on each Standard-J plane and \$875 on each DeHaviland, making a total fixed profit of about \$3,750,000, exclusive of fixed profit on spare parts covered by the contract, thus expected to be earned, according to the contemplated deliveries, before the end of 1918.

The contract also provided for additional profits to the extent of 25 per cent of the saving under the bogey or estimated cost of the planes (\$7,000 on the DeHavilands) and it is estimated that the additional profit on this basis would have amounted to over \$2,600,000. When the bogey cost of \$7,000 was fixed, letters were obtained from the Dayton Wright Airplane Co., and from the Fisher Body Corp. (which also had a contract for DeHavilands), that after 250 machines had been produced there would be an equitable adjustment if the bogey cost was found to be "materially wrong." Accordingly, a contract is now about to be signed reducing the bogey cost to \$5,000 and the fixed profit to \$625 per plane.

Even at this rate, the fixed profit on the 4000 DeHavilands will be \$2,500,000, and it is believed that there will be an additional profit through saving under the bogey cost, and on spare parts, of not less than \$1,000,000.

In August and September, 1917, when the first Government contracts were awarded, the capital stock of the company (\$1,000,000) had not been paid in. It was not paid in until Dec. 1, 1917, when, in one transaction, the stock was paid for

and all the shares, preferred and common, save five qualifying shares were transferred to the Dayton Metal Products Co., which thus became and still remains the owner of the Dayton Wright Airplane Co.

As the latter company practically received nothing on the issue of its capital stock save the fixed property represented by its plants, it was lacking in working capital and this at the outset was supplied by various loans and advances of the interested parties. In December the Government agreed to advance the company \$2,500,000, of which \$1,500,000 was advanced at once.

The name of Orville Wright was used in this enterprise, but his chief activity has been as a consulting engineer in connection with experimental work. He has not been responsible for production. Mr. Kettering is an engineer of ability, but his work also has been that of experimental engineering; he is not a manufacturing or production expert.

Much emphasis is placed by the parties concerned upon the fact that they were able to avail themselves of the old Wright organization which had been continued as already stated. But this was a very slender basis for the prompt selection of this newly-organized company, which had not even completed its financial arrangements, as one of the few companies immediately admitted to the advantages of large and highly profitable Government contracts.

The promoters of this enterprise, not content with these profits which were to accrue to them either directly or through their ownership of the Dayton Metal Products Co. at once took advantage of the opportunity to increase their gains by salaries as executive officers of the Dayton Wright Airplane Company. Dating from Aug. 1, 1917, the salaries thus allowed were as follows: H. E. Talbott, Sr., \$35,000; C. F. Kettering, \$35,000, and H. E. Talbott, Jr. (thirty years old, who was made president of the company), \$30,000. Talbott, Sr., was at the time receiving, and continued to receive, \$60,000 a year as president of the Dayton Metal Products Co., Kettering received a salary of \$25,000 from the Dayton Metal Products Co. and \$50,000 from the Delco Co.; and Talbott, Jr. was also receiving a salary of \$18,000 from the Dayton Metal Products Co.

There would seem to be no question but that the members of the Aircraft Production Board in recommending contracts had confidence in the capacity of those undertaking the venture, and the previous success of this group, while Mr. Deeds had been associated with them, was well known.

But the fact remains that practically at the inception of the Government's aviation activity in connection with the War, and within the sphere of Colonel Deeds' important if not commanding influence, his former business associates were placed at once through Government contracts in a position where they had the assurance of very large profits upon a relatively small investment of their own money and in addition were able to secure generous salaries which they charged against the Government as part of the cost of manufacture.

That Deeds, Kettering and Talbott continued to be on the most intimate and confidential footing in connection with the prosecution of the Government work by the Dayton Wright Airplane Company is apparent from their correspondence, of which the following are excerpts:

Letter Deeds to Kettering, June 13, 1917:

Mr. C. F. Kettering, Washington, June 13, 1917.  
City National Bank Bldg.,  
Dayton, Ohio.

My dear C. F.:

You will be interested to know that the standard training machine is going to be called the U. S. primary training and will not be called the Curtiss J.N. This was decided last week and I forgot to tell you when in Dayton.

Provision will be made for either Mr. Coffin or myself to appear before the S. A. E., and as I am one of the Committee on Arrangements will see that the plans of the Aircraft Production Board get properly before the Association.

Relative to the design of planes, I do not care to write what is being done but will discuss it with you when I get home and you will see that we have already gone away down the pike in this matter. Everything is filling up now in pretty good shape.

Yours very truly, E. A.

\*Society of Automotive engineers.

Telegram Deeds to Talbott, July 3, 1917:

Mr. H. E. Talbott, July 3, 1917.  
Dayton, Ohio.

General Squier went direct to Detroit. Will probably spend fourth at his old home in Michigan. May be in Dayton Thursday or Friday, arriving there from Detroit or from Champagne, Illinois. Harold, Kettering and Wright can take care of him. He will be interested in the Dayton Wright factory and laboratory. Orville Wright laboratory and especially Mr. Kettering's views on scientific subjects. In general he is highly technical.

E. A. Deeds.

Telegram Kettering to Deeds, August 4, 1917:

E. A. Deeds, Dayton, Ohio, August 4, 1917.  
Room 527, Munsey Building,  
Washington, D. C.

We believe all confidential telegrams should be sent to Mr. H. E.

Talbott, Sr., City National Bank Building, or George B. Smith, instead of the Dayton Wright Airplane Company.  
C. F. Kettering.

#### Telegram Deeds to Kettering, August 4, 1917:

August 4, 1917.  
Mr. C. F. Kettering,  
City National Bank Building,  
Dayton, Ohio.  
Hereafter all confidential telegrams will be sent to H. E. Talbott, Sr., instead of to the Dayton Wright Airplane Company.  
E. A. Deeds.

#### Telegram Deeds to Talbott, September 16, 1917:

Old Point, Virginia, Sept. 16, 1917.  
H. E. Talbott,  
Dayton, Ohio.  
For your personal information as coming from your local attorney. Judge Advocate General has ruled it legal for government to select one, contractor one and the two a third, as appraisers of market value of plant at expiration of contract. If you care to raise the question the above will be found to be the final ruling.  
E. A. Deeds.

When this last telegram, which puts in a strong light the relations of the parties, was sent, Deeds was an officer in the Army. This highly improper conduct, in holding communication in this manner with his former business associate in a transaction pending between the Dayton Wright Company and the Government Department in Colonel Deeds' charge, demands the attention of the military authorities.

But evidence of favoritism, influence, or confidential communications of this sort, however otherwise reprehensible, do not make out criminal liability under the statutes above quoted, unless it appears that the representative of the Government has a pecuniary interest in the Government contract or order, or is an officer or stockholder of, or has a pecuniary interest in, a corporation, firm or association which is a party to the Government contract or order. And the question is whether Colonel Deeds had such an interest. His statement is that he had no such interest but on the contrary had given up large salaries to devote himself to the Government service.

About the time he received his commission as Colonel in the Army, Mr. Deeds addressed the following communications to the Secretary of War and to the Aircraft Production Board, under date of August 28, 1917:

Washington, D. C., Aug. 28, 1917.

Hon. Newton D. Baker,  
Secretary of War,  
Washington, D. C.

Dear Sir:

You have honored me by appointment temporarily as an officer in the Regular Army of the United States, and as a member of the Aircraft Production Board connected with your Department. It is possible that this Board in the development of the airplane work may wish to recommend a contract with some of the corporations in which I have had an interest. Following the advice of counsel, I have resigned my official relations with these corporations, and made bona fide transfers of my stock therein to other parties.

For your protection as well as my own, I desire to file with your Department a copy of a written disclosure of my relations, both past and present, to these corporations which I have this day filed with the Aircraft Production Board, and I enclose same herewith.

In serving in the positions to which you have appointed me, I desire to comply with both the spirit and letter of the law, and to do no act which might invite criticism upon myself or your Department.

I count it an honor and privilege to be thus called into the service of our country and am pleased to make whatever sacrifice of time and money that service may demand.

I enclose a second copy of my statement to be filed with you as Chairman of the Council of National Defense.

Yours very respectfully,  
(Signed) E. A. Deeds.

Washington, D. C.,  
August 28, 1917.

The Aircraft Production Board,  
Washington, D. C.  
Gentlemen:

As a member of your Board and interested in the letting of contracts on the recommendation of that Board on behalf of the Government, I desire at this time to make a full and complete disclosure of the interest I may have in any corporation which might be a party to any such contract, or which might furnish supplies to the Government through the instrumentalities of your Board.

I was a stockholder and officer in the following, to wit:

- (1) The United Motors Company of New York, being a union of several companies manufacturing automobile parts.
- (2) The Dayton Engineering Laboratories Company, of Dayton, Ohio, manufacturers of ignition and starting devices for automobiles.
- (3) The Dayton Metal Products Company, of Dayton, Ohio, engaged among other things in the manufacture of munitions.
- (4) The Domestic Building Company, of Dayton, Ohio, a corporation formed for the development of real estate and which now owns the land and buildings leased to The Dayton Wright Airplane Company.

In all of the foregoing corporations I have severed my official connection therewith by resignation and have made a bona fide transfer to other parties of all my stock therein.

In addition to the above corporations, I was an incorporator of The Dayton Wright Airplane Company, but never owned any stock therein. I am also the president of and a large stockholder in The Domestic Engineering Company, of Dayton, Ohio, makers of Delco Light Plants, and expect to retain my official connection therewith and my financial interest therein.

I also own the ground embraced in The Moraine Experimental

Flying Field near Dayton, Ohio, used for aviation purposes but out of which I receive no compensation.

I make this disclosure now so that your Board, as the representative of the Government, may be fully informed as to my relations, past and present, with these corporations, and be thus enabled to act wisely on any order or contract involving any of these corporations either directly or indirectly. I desire that this written disclosure be recorded in the minutes of your Board for the mutual protection of all of us.

Yours very respectfully,  
(Signed) E. A. Deeds.

The facts with respect to the disposition of Colonel Deeds' interests (so far as pertinent to this inquiry), and the method of disposition, are as follows:

#### United Motors Corp.

#### Dayton Engineering Laboratories Co.

The significance of Colonel Deeds' statement with respect to the disposition of his interests in these corporations is that the Delco ignition system is used in the airplane engine known as the Liberty motor. In the planes manufactured abroad, the magneto ignition system had been used and prior to its use on the Liberty motor, it appears that the Delco system had not been employed on an airplane engine. In the specifications for the Liberty motor, the Delco system was required to be installed with the first 20,000 engines. As already stated, the Delco system is controlled by the Dayton Engineering Laboratories Co. (Delco company) and this company is owned by the United Motors Corp.

On the sale of his Delco stock to the United Motors Corp., Deeds had received, in addition to cash, 30,000 shares (no par value) of its stock. [The total issued stock amounted to 1,200,000 shares.] After certain distributions, he still held at the time in question, 17,500 of these shares. He also had an interest in a pool of certain shares, on which 3880 additional shares were received in November, 1917.

In his letter (above quoted) to the Aircraft Production Board, Deeds stated that he had severed his official connection with the United Motors Corp. and had made a bona fide transfer of his shares. He had resigned as Vice-President and director on Aug. 16, 1917.

The only transfer made by him of any of his shares in that company was by gift to his wife. He endorsed, for transfer, the certificates for 17,500 shares on October 13, 1917, and they were transferred to Mrs. Deeds' name on October 17, 1917.

Thereafter, it is testified, they were held by the confidential agent, George B. Smith, for her account. Entries of the transfer were made in Colonel Deeds' books by Smith not earlier than October, 1917, and were dated back to August 28, 1917. In the earlier statement of his assets on August 31, 1917, submitted to him by Smith, the shares appear as part of his property. Mrs. Deeds' name first appears in the statement of assets of October 31, 1917. The remaining shares (3880) received on the dissolution of the pool about November 22, 1917, were transferred from the pool manager directly to Mrs. Deeds, as Mr. Deeds' donee, and the certificates were received by Smith on her behalf. Prior to the transfer of the stock in October and at the time of Colonel Deeds' letter to the Aircraft Production Board, he had simply told his wife that it was to be her stock, and it does not appear that there had been an effective gift of the shares. The actual value of the 21,380 shares was approximately \$500,000.

In addition to these shares in the United Motors Corp., Deeds also held 38 shares of Delco preferred stock, which he had retained at the time of the sale of his common stock. These preferred shares he transferred to Kettering. It appears that the transfer was first entered by Smith in Colonel Deeds' private journal in December, 1917.

The date of the entry was afterwards changed to August 28, 1917 to correspond to the date when Smith was notified that Colonel Deeds had received his commission in the Army. The stock was transferred to Kettering on the books of the company on October 13, 1917. The payment was made by debits in Deeds' open account with Kettering.

If there were evidence that Colonel Deeds had acted as officer or agent of the Government in the transactions with the Delco Company, or with the United Motors Corp., prior to October 13, 1917, there would be ground by reason of his interest for charging a violation of the statute, and it may be doubted whether there was then or thereafter such a transfer as would avail to take the case out of the statutory prohibition.

But there is no evidence that Deeds acted for the Government in any transaction with either of these corporations. So far as appears, the Government made no contracts for Delco ignition either with the Delco company or with the United Motors Corp.

The contracts for the Delco system were made by the contractors who were manufacturing the engines under contracts

with the Government, and the dealings with the Delco company or with the United Motors Corp. in relation to the Delco system were had by these contractors.

It must also be said that, despite the natural inference from former business association and interests, the proof is lacking that the selection of the Delco system was due to the solicitation of Deeds. It can hardly be questioned that the design of the Liberty motor contemplated the use of the Delco system, and that the magneto system could be used only by a special adaptation.

The Delco system, however, had been extensively used for automobiles, notably by the Cadillac and Packard companies, and was in high favor with those who were developing the Liberty motor. While there has been a question as to which system was preferable, and it has been understood that foreign representatives at first did not approve the departure from foreign practice, and many may still be found to disapprove it, there is considerable evidence that the use of Delco ignition has been growing in favor, and there has been testimony in this investigation from impartial and competent sources commending its adoption.

Special attention has been given to the memorandum directing the use of the Delco system in the first 20,000 Liberty motors. In the first memorandum by Major Gray, Chief of the Specification Section, under date of October 6, 1916, the accessories recommended were so placed that the Delco ignition came last on the list. This was then rearranged, apparently to attract less attention to Delco in alphabetical order.

The recommendation, Major Gray testifies, for the use of the Delco system and the other accessories specified came from Major Vincent, one of the designers of the Liberty motor and then executive officer of the Airplane Experimental Department of the Equipment Division, who stated that he did not believe they would be justified "in specifying for quantity production any other accessories than those which had thus far been tested out satisfactorily."

The situation was a delicate one, says Major Gray, as Major Gray himself had been president of the Hess Bright Company (he had resigned his office and disposed of his holdings in June, 1917), whose ball-bearings were required as one of the accessories, and Colonel Deeds had developed the Delco system. Major Gray testifies that he brought the question to Colonel Deeds' attention, who said, "I do not like really to have anything to say about it, because in that list is the Delco ignition and if I authorize it it will look as though I have an axe to grind." The sum of the matter is that there is no satisfactory evidence that Colonel Deeds signed, prepared or directed the order for the use of the Delco ignition although it cannot be doubted that he desired the system to be used. Nor is there evidence that any recommendation was made by Colonel Deeds to the Aircraft Board or to any other council, board or commission regarding the matter.

His statement to the Aircraft Production Board on Aug. 28, 1917, that he had made a *bona fide* transfer of all his stock in the United Motors Corporation, when the stock had not in fact been transferred and at most he contemplated a gift of the stock to his wife, was neither candid nor truthful, and is certainly not to be regarded as a "full and complete disclosure." But in the absence of proof of solicitation, inducement or recommendation by him, or action on his part as an officer or agent of the Government in transactions with the United Motors Corp. or the Delco company, there are no facts bringing the case within the statutory prohibition.

#### Domestic Building Co.

In his letter of Aug. 28, 1917, to the Aircraft Production Board, Colonel Deeds stated that he had made a *bona fide* transfer of his stock in this company. This was not true. It appears that on that date he resigned the office of president of the company, but he did not dispose of his stock. The stock of that company is still held in equal portions by Deeds and Kettering.

Colonel Deeds was plainly led to make the statement in his letter by the fact that the Domestic Building Co. had acquired the land and had erected the building which was in course of completion, and was then occupied and intended to be used as the principal plant of the Dayton Wright Airplane Co. for the manufacture of airplanes.

It is said that in anticipation of a lease of the property to the Dayton Wright Airplane Co., it had been agreed prior to Aug. 28, 1917, that Deeds' stock in the Domestic Building Co. should be sold to Kettering.

But there is not sufficient evidence of a definite and binding agreement to that effect, or of anything more than a loose understanding between intimates, whose arrangements could at any time be adjusted to suit their mutual convenience.

Certainly, there had been no transfer of the stock. It was

not until November that there was an adjustment of accounts with this company, and then, instead of a sale of his stock by Deeds, he retained his stock in the Domestic Building Co. and the plant erected by that company was purchased by Talbott, Sr., Kettering and Talbott, Jr. who at once transferred it to the Dayton Wright Airplane Co.

On Feb. 4, 1918, the Domestic Building Co. made a direct conveyance to the Dayton Wright Airplane Co. of an additional tract of 8.34 acres, adjoining the first tract, at the price of \$13,344, or \$1,600 per acre.

However, there is no ground, so far as the retention of Deeds' stock interest in the Domestic Building Co. is concerned, for charging a violation of statute. It is not enough that the Dayton Wright Airplane Co. purchased these properties, or that certain advances by Deeds were taken into account in fixing the purchase price of the main plant, or that both parcels of land were sold at more than the amount they had cost the Domestic Building Co.

The Government has never had any contracts with the Domestic Building Co. and it does not appear that Colonel Deeds has acted as an officer or agent of the Government in any transactions between the Government and that company. The gratuitous statement contained in his letter to the Aircraft Production Board that he had made a transfer of all his stock in this company may be said to indicate a willingness to state, as an accomplished fact, a transaction which never took place but was merely in contemplation as a step to be taken if deemed to be necessary.

#### Dayton Wright Airplane Company.

Colonel Deeds' statement in his letter of August 28, 1917, that he had never been a stockholder in this company was true. The stock is owned by the Dayton Metal Products Co., and if Colonel Deeds had or has any interest through stock ownership in the profits on its contracts with the Government, this interest must be derived from an interest in the stock of the Dayton Metal Products Co.

His relation to the organization of the Dayton Wright Airplane Company is this: He was an incorporator, and while he did not subscribe for stock, and none was issued in his name, the payment of the stock of the company to the extent of upwards of four-fifths of its par value was made, in substance, by the transfer to the company of the plant built by the Domestic Building Co., owned by Deeds and Kettering, and this company received therefor unsecured notes of Talbott, Sr., Kettering and Talbott, Jr., only a small part of which has been paid. Thus, Deeds and Kettering through the Domestic Building Co., virtually furnished the main plant of the Dayton Wright Airplane Co., on a credit to the Talbotts and Kettering. The transaction was as follows:

The airplane factory was erected on a tract which the Domestic Building Company had acquired from the Moraine Development Company (a corporation in which Deeds and Kettering were largely interested) at a price a little over \$753 an acre. The building was intended for the use of the Domestic Engineering Company, another concern owned by Deeds and Kettering, which was engaged in the business of supplying Delco lights for general illuminating purposes.

It was later decided that it should be used by the Dayton Wright Airplane Co., which entered into possession. Still later, it was arranged that the syndicate composed of Talbott, Sr., Kettering and Talbott, Jr., should purchase the plant from the Domestic Building Company and convey it to the Dayton Wright Airplane Co.

In November, 1917 (while the building was still incomplete), Mr. Allan R. Smart, a public accountant (of Barrow, Wade, Guthrie & Company) made an adjustment of the accounts of Deeds, Kettering, Talbott, Sr., and Talbott, Jr., for various advances and a balance was struck of \$683,732.16 as owing to the Domestic Building Company.

In this adjustment, the land (25.55 acres) was taken at \$1200 an acre and the building at the amount of the expenditures upon it, making the price of the plant (called the Moraine plant) \$836,401.08. The balance of \$683,732.16 was covered by three individual notes of Talbott, Sr., Kettering and Talbott, Jr., in the proportion of two-fifths, two-fifths and one-fifth, as follows: H. E. Talbott, \$273,492.87, C. F. Kettering \$273,492.87, and H. E. Talbott, Jr., \$136,748.43.

All of the notes were dated November 4, 1917, and were payable to the Domestic Building Company one year after date with 6 per cent interest. The notes are unsecured. The makers of the notes have paid interest quarterly; and, in addition, Talbott, Sr., has paid \$3,492.87 on the principal of his note, reducing it to \$270,000, and Talbott, Jr., has paid \$26,746.43 on the principal of his note, reducing it to \$110,000.

It appears that Mr. Kettering has made payments of

\$6,000. This transaction left the Talbotts and Kettering as the owners of the Moraine plant, which the Dayton Wright Airplane Company was operating, and the stock of the Dayton Wright Airplane Company for which they had subscribed had not been paid in.

The payment of the subscriptions for the stock of the Dayton Wright Airplane Co., the concurrent payment by that company for two plants (the Moraine plant, already mentioned, and another at Miamisburg), and the transfer of its stock, thus paid for, to the Dayton Metal Products Co., were effected by an exchange of checks on Dec. 1, 1917.

Shortly before, the Miamisburg plant had been acquired by Talbott, Sr. (for the syndicate), for the sum of \$60,000 and was turned over to the Dayton Wright Airplane Co., at \$127,202, the profit being divided between himself, Kettering and Talbott, Jr., according to their respective interests in the syndicate. To accomplish the desired result, the following procedure was adopted:

The Dayton Wright Airplane Co., gave to the syndicate its check for the sum of \$955,071.25, made up of the purchase price of the Moraine and Miamisburg plants (\$836,401.08 less an item of interest (\$8,531.83) for the Moraine or main plant and \$127,202 for the Miamisburg plant).

The Dayton Metal Products Co., gave its checks to the syndicate for \$183,459.55, for various balances of accounts and for \$999,500, the purchase price at par of the stock of the Dayton Wright Airplane Co. (less five shares retained). The syndicate thus received checks to the aggregate amount of \$2,138,030.80.

The syndicate gave their check to the Dayton Wright Airplane Co., in payment of the capital stock of \$1,000,000 and another check to the Dayton Metal Products Co., for \$1,136,537.20 as the purchase price of certain securities which the Dayton Metal Products Co. sold to the syndicate, making the total of the syndicate's checks \$2,136,537.20.

The Dayton Wright Airplane Co. gave its check to the Dayton Metal Products Co., in re-payment of advances for \$44,928.75, the difference between the sum of \$955,071.25 paid by the company for the plants and the sum of \$1,000,000 received for its stock.

The transaction was accomplished with a minimum use of cash (less than \$1,500), and as a result the Dayton Metal Products Co., had all the stock (save five shares) of the Dayton Wright Airplane Co.; the Dayton Wright Airplane Co., had the Moraine and the Miamisburg plants; Messrs. Talbotts and Kettering had the securities which they had purchased from the Dayton Metal Products Co.; and the Domestic Building Co. (owned by Deeds and Kettering) continued to hold the notes which the Talbotts and Kettering had given to that company on the settlement in November.

In the transfer by the syndicate of the shares of the Dayton Wright Airplane Co. to the Dayton Metal Products Co., it was agreed that all dividends in excess of 7 per cent. per annum on the transferred stock, and in excess of 8 per cent. per annum on the common stock, should be paid to Talbott, Sr., Kettering and Talbott, Jr., in the proportion of two-fifths, two-fifths and one-fifth.

Why they should have desired these profits to be divided in the syndicate proportions instead of taking the profits through their dividends, in the proportions in which they held the stock of the Dayton Metal Products Co., the purchaser of the shares, has not been made clear. The Talbotts and Kettering also took an option from the Dayton Metal Products Co., to repurchase all the shares at any time within five years for the sum of \$999,500.

#### Dayton Metal Products Company.

Colonel Deeds originally held one-fourth of the stock of this company, or 500 shares. It appears from the minutes of the Board of Directors that at a meeting of the Board in Dayton, on May 21, 1917, President Talbott stated that the company had been advised by the Ordnance Department of the Army "that, in all probability, the entire facilities of the company would be utilized for munition work, and, in all probability, contracts would be given to the company as soon as appropriations were made by the Government."

It is further set forth "that Mr. E. A. Deeds explained that he had been called to Washington and requested to take place on some of the committees of the Council of National Defense; that he had been to Washington and that he had accepted the call, and he therefore desired it that he might act as uninterested, directly or indirectly, in any manufacturing plant which was contemplating business with the Government, and that he desired to offer his resignation as vice-president and as director of the company." The minutes show the acceptance of this resignation and that Mr. Kettering was elected vice-president. The minutes of the

meeting of May 21, 1917, conclude with the following statement:

At this meeting Mr. Deeds offered for sale and discussed probable purchasers for his stock in the Dayton Metal Products Co., and Mr. Deeds offered to the directors his entire holdings of stock at its book value less 15% to cover costs and probable losses in view of the possibility of no future Government contracts being secured and the business of the company would have to be readjusted into lines being developed by the Experimental Department.

Some time subsequently—in the early part of the year 1918—the accountant drew a line across the last-mentioned statement in the minutes. He explains that he did not consider it "a corporate record," but a matter between the stockholders.

The testimony of the parties concerned is that Talbott, Sr., Kettering and Talbott, Jr., purchased all Deeds' shares in the Dayton Metal Products Co., at their book value as of May 1, 1917, less 15 per cent. and gave in settlement of the purchase price their notes as follows:

H. E. Talbott.....	200 shares	\$207,706
C. F. Kettering.....	200 shares	207,706
H. E. Talbott, Jr.....	100 shares	103,853

The notes were dated May 22, 1917, were payable to Deeds' order one year after date, with interest at 4½ per cent, and were placed in the hands of George B. Smith, the confidential agent of Deeds and Kettering. The notes were wholly unsecured. According to the stock certificate book the old certificates were cancelled and new certificates issued to the Talbotts and Kettering under date of May 22, 1917.

It is not only open to doubt whether the transaction described in the minute book took place on May 21, 1917, but on all the evidence it is reasonably clear that it did not take place on that date. The minutes are typewritten and pasted in the minute book.

No one of the parties is willing to testify positively that the proceedings described in the minutes took place on that day. Mr. S. S. King, of the Dayton Lumber & Manufacturing Company, has testified that he and Deeds went to Washington on the same train on May 18, 1917, and that they were in communication every day in Washington, from May 19th to 23d.

Furthermore, it appears that on May 21, 1917, when Mr. Deeds is represented as making his statement at the meeting of directors in Dayton, he was making his first appearance, according to the minutes of the Aircraft Production Board, at a meeting held by that Board on that day in Washington. He himself testifies that he was in Washington on that day.

While Mr. Deeds is represented as resigning his office as vice-president of the Dayton Metal Products Co. in May, 1917, he continued to draw his salary until the end of June, 1917. The notes were placed in the custody of the confidential agent Smith, but he made no entry in Deeds' bills receivable book of these notes, until September.

It does not satisfactorily appear, in view of the nature of some of the items, that the adjustment of accounts in fixing the book value and the determination of the amounts of the notes could have been made before June 30, 1917.

There are stock certificates bearing the date of May 22, 1917, and purporting to have been issued after the issue of the new certificates to the Talbotts and Kettering for the Deeds' shares, but these certificates were issued to members of the Talbott family dividing the shares he had formerly held.

Upon all the evidence, it is not established that the stock was purchased as early as May 22, 1917, and there are many indications that the transaction was dated back to that date.

However, Colonel Deeds' stock was actually transferred on the books of the company, and the notes dated May 22, 1917, were given, apparently not later than September, 1917.

On Dec. 31, 1917, interest was paid by the makers on their respective notes to that date; and interest was paid quarterly thereafter. On Jan. 18, 1918, Talbott, Sr., paid \$7,706 on account of the principal, reducing his note to \$200,000; in February, 1918, Talbott, Jr., paid \$3,853 on account of the principal, reducing his note to \$100,000, and on Sept. 11, 1918, Kettering paid, on account of his note, the sum of \$10,000.

If the transaction was a *bona fide* sale of the stock Colonel Deeds thereby parted with all his stock interest in the Dayton Metal Products Co. and thus did not have, by virtue of an interest in that stock, an interest in the profits of the Dayton Wright Airplane Co. The parties all deny that there is any secret agreement or option or understanding of any sort for a retransfer of the shares to Colonel Deeds, or for a sharing of profits with him.

To conclude: The fact is that the transfer of the shares in the Dayton Metal Products Co., which owns the stock of the Dayton Wright Airplane Co., was made to Colonel Deeds' intimate business associates on their unsecured notes, which are overdue and unpaid save to a small extent. But there is

no proof upon which it can be charged that Colonel Deeds retained an interest in the Dayton Metal Products Co. and thereby in the Dayton Wright Airplane Co.

#### The Wilbur Wright Field

This is a tract of about 2245 acres leased to the Government by the Miami Conservancy District, of which Mr. Deeds was the head. It was a portion of the area selected by the Miami Conservancy District for the impounding of waters in the event of a serious flood. The property was acquired by the Government for a flying field and was developed by the erection of hangars, barracks, a storehouse and other structures. Upward of \$3,000,000 has been expended by the Government in this development.

On April 30, 1917, Major (now General) Foulois was directed to inspect land sites for aviation purposes at various places, including Dayton, and several tracts at Dayton were examined by him, and by Captain (now Colonel) Edgar, on May 8. These officers were met at Dayton by Mr. Deeds and both Deeds and Orville Wright accompanied them on their inspection of the tracts in the vicinity. As to these, on May 11, 1917, Major Foulois reported as follows:

The largest tract of land inspected is about ten miles from Dayton and contains about 4000 acres. This tract of land is admirably suited for aviation purposes, is under the control of the Conservancy directors and any portion of it can be acquired by the Government at a very low cost. The purpose for which this land has been set aside by the State of Ohio makes it extremely desirable for aviation purposes, in that it will be always used for agricultural purposes only and no buildings or other obstacles will ever be erected within the area set aside. Options on this tract of land, or any portion thereof, will be mailed to this office within the next few days.

On May 15, 1917, General Squier recommended that the approval of the Secretary of War be obtained for the rental of several aviation training sites, including the one at Dayton which was thus described:

Approximately 2500 acres in the vicinity of Dayton, Ohio, at the rate of \$17,500 per year with the privilege of renewal for three years, and the option of purchase at \$350,000, the cost of crop destruction being \$75,000. This will provide a four-squadron training field.

Mr. Coffin, as chairman, endorsed the proposal, stating that it was "in the judgment of the Committee a wise and necessary action," and the project was approved on behalf of the Secretary of War by the Acting Chief of Staff. On May 19, 1917, General Squier authorized Captain Edgar to lease this site, and others, and to proceed with the contracting for the necessary buildings.

The first lease was signed on May 22, 1917 (by Captain Edgar for the Government and Mr. Deeds for the Conservancy District) for 2075 acres for the period ending June 30, 1917, at the rental of \$2,000, the Government also agreeing to pay \$73,000 to cover damages to crops.

There was an option for renewal for the year beginning July 1, 1917, at the rental of \$17,660, and for a further renewal for the year beginning July 1, 1918, for a tract containing 2500 acres (including the 2075 acres first mentioned) at a rental of \$20,000, and for further annual periods ending July 1, 1922; and there was also an option to purchase the 2500 acres for \$350,000.

Of the proposed tract of 2500 acres, 505.27 acres were found to be marshy and were withdrawn and 250.47 acres, said to be of equal value, were added. This left a tract of 2245.20 acres, for which a new lease was executed on July 1, 1917, for the period ending June 30, 1918, at the rental of \$18,404.69, with annual options of renewal at a rental of \$20,000 until June 30, 1922, with the option to purchase at the same price.

The rental for the first year is explained by the fact that there were 210.47 acres of which possession could not be taken until March 1, 1918. Soon after that date the Commanding Officer at the field stated that 34.94 acres were in the possession of the Government, but that the remaining acres were available for occupancy but "were very low and swampy and in the present condition of no value to the Government." For the Miami Conservancy District it was stated that it had settled with the tenants at considerable expense in order to get possession and it was unwilling to take back the land from the Government.

There is an adjoining tract of 32 acres (part of the original 2500 acres) which with 8 acres additional were sold to the Government as a site for a warehouse.

It appears from the testimony of Ezra M. Kuhns, the secretary of the Miami Conservancy District, that at the time of our entry into the war the District had been able to secure options on only about 300 acres of the tract in question, but when negotiations with the Government began there was swift action. Mr. Deeds had brought the matter to the attention of Mr. Waldon as early as April 24, 1917, and had sent to

him one of the District's engineers with maps. The following telegrams show the activity of Deeds and Talbott:

Telegram Deeds to Kuhns, April 30, 1917:

Washington, D. C., April 30, 1917.

Ezra M. Kuhns,  
Miami Conservancy District,  
Dayton, Ohio.

Subject of our trip yesterday moving very rapidly and very satisfactorily. There is no doubt in my mind but what we will be successful. Avoidance of publicity very essential. Inspection will be made end of this week or first of next. You and Morgan\* must plan now as though it was decided.

E. A. DEEDS.

\*Morgan was the engineer of the Miami Conservancy District.

Telegram Deeds to Kuhns, April 30, 1917:

Washington, D. C., April 30, 1917.

Ezra M. Kuhns,  
Miami Conservancy District,  
Dayton, Ohio.

Options should be rushed in the vicinity of Fairfield raising the price if necessary.

E. A. DEEDS.

Telegram Deeds to Kuhns, April 30, 1917:

Washington, D. C., April 30, 1917.

Ezra M. Kuhns,  
Miami Conservancy District,  
Dayton, Ohio.

Ohio State University is ordered to-day to co-operate with the Dayton School and Magruder Lord and Knight instructed to report at Camp Borden Canada Monday to learn course of instruction. Publicity will follow these instructions, and no one outside of Signal Corps officers know of our plan for the larger school and so far as everyone is concerned Dayton School is the Wright field civilian school. Think you should advise Wright Morgan Harold Talbott and Kettering so that they will not disclose anything inadvertently. The civilian school will continue, regardless of what is done with the other plan and Ohio state will give the preliminary instruction in military tactics and all class room work while the Wright Field Company will give the instruction in aviation. Harold Talbott should be the channel through which publicity is given out, and there is no objection using the last statement if called upon.

E. A. D.

Telegram Deeds to Talbott, May 11, 1917:

Washington, D. C., May 11, 1917.

H. E. Talbott,  
Dayton, Ohio.

Think your whole plan ideal.

E. A. DEEDS.

Telegram Talbott to Deeds, May 11, 1917:

May 11, 1917.

E. A. Deeds,  
Care New Willard,  
Washington, D. C.

Contracts remaining secured to cover twenty-five hundred acres will be closed by to-morrow evening. Will start Monday on immediate possession of land so the fields will be ready when buildings are finished. This applies to central one thousand acres in front of building. Builders may retain use of buildings and barns for a few months and in some cases until winter, but main fields must be prepared without delay if they are to be used this fall. Think best to give no reason for immediate possession and feel sure we can arrange it. We can arrange financial matters as suggested. Wire if you approve.

H. E. TALBOTT.

Telegram Deeds to Talbott, May 11, 1917:

Washington, D. C., May 11, 1917.

H. E. Talbott,  
City National Bank Building,  
Dayton, Ohio.

With few exceptions owners can, if necessary, continue to live in their houses for a year thus avoiding necessity of moving this summer. Their teams will be employed, giving revenue to them. District wants to try out flying on large scale and wants to try experiment at once. This is only a suggestion. You doubtless may have a better one. May be necessary to exercise option at once, and if so I will gladly go on District's note for full amount.

E. A. DEEDS.

Telegram Deeds to Talbott, May 12, 1917:

Washington, D. C., May 12, 1917.

H. E. Talbott,  
City National Bank Building,  
Dayton, Ohio.

Suggest Kuhns Emmett Grant and Brown be here Monday morning for conference on conservancy bringing description of entire twenty-five hundred. Tax value and tax rate of property under discussion. Will be helpful. Publicity can be delayed at this end without difficulty. Everything moving nicely.

E. A. DEEDS

The partiality for this site does not appear to have been warranted by any advantages it can be said to possess. Indeed, no satisfactory reason appears for the securing of so large a tract, as apparently 1400 or 1500 acres would have answered the purpose.

Fields of about 650 acres were selected at Rantoul and Detroit for two-squadron fields, and the field at Dayton was for four squadrons. Both the leasehold interest and the option to purchase are subject to a flood easement. The evidence is that in case of a flood such as that of the year 1913, the impounded water (that is, after the completion of the dam which it is understood will be completed in two or three years) would cover the lowland to a depth of about forty feet; the lowest hangar would have twenty-four feet of water, that is over the eaves, and the highest hangar would have thirteen feet of water. The barracks and various buildings which stand on higher ground would not be seriously affected. The warehouse itself (a large structure) is in a dry place, and the suggestion that some of the property stored there during the past year has suffered from moisture is not supported. Aside from the consequences of flood in the Miami Valley and the use of the area as a detention basin, it should be added

that a considerable part of the tract consists of swamp land which is unsuitable for the use for which it was leased.

There is no evidence that Deeds himself had any interest in the land acquired. He was head of the Miami Conservancy District, but this was a public enterprise not organized for profit. Apparently, at an earlier period, advances had been made by the Dayton Metal Products Company (a portion of which had originally been charged to Deeds personally and later credited back to him and charged to the maintenance account of the company) which had been used for the purchase of options for the District.

The result of this transaction was to leave the Dayton Metal Products Company a creditor of the enterprise but without interest in the land. Mr. Deeds had been appointed on the Munitions Standards Board in March, 1917, and he accepted appointment on the Aircraft Production Board on May 11, 1917. At this time, however, he was acting only in an advisory capacity and it was before the passage of the Act of Aug. 10, 1917. He testifies that his only interest in this project was as a citizen of Dayton.

#### The Contract for Wilbur Wright Field

The next step was the placing of the contract for development. The contract was signed by Captain Edgar under the direction of the Chief Signal Officer and its terms were not unreasonable. It was on a cost-plus basis with a sliding scale, which as applied to the amount actually expended gives the contractor a commission of seven per cent with a maximum limit of \$140,000. The contractor, the Dayton Lumber and Mfg. Co., was recommended by Deeds.

This company had done nothing in an extensive way for several years, having been engaged since the year 1908 in selling material, and in operating a planing-mill and a lumber-yard. Its capital stock was \$75,000. Prior to April, 1917, one S. S. King had owned 117 of the 750 shares. King's holdings were then increased to 417 shares, and in acquiring these 300 shares King was backed by H. E. Talbott, who as president of the City National Bank of Dayton arranged for a loan of \$60,000 for the purpose. King wrote Talbott on April 25, 1917: "As to the ownership of the stock, if you see fit to back me up in it this can be determined in any manner that you see fit."

It was not long after the control of the Dayton Lumber and Manufacturing Company was thus acquired that the arrangement was made for giving to this company the contract to develop Wilbur Wright Field. King's narrative of the circumstances in which this contract was obtained is very illuminating, and affords a notable contrast to the difficulties of many who unavailingly sought contracts with the Government.

King was sent for by Talbott and informed that he (King) had been "recommended down at Washington to assume the responsibility of putting up some buildings for Wilbur Wright Field," and suggested that he immediately set about effecting an organization for the purpose. This was on Saturday, May 17, 1917, and on Sunday Talbott telephoned to King, asking him to leave immediately for Washington.

Accordingly King went to Washington on Sunday afternoon, taking the same train with Deeds. It was arranged that King should call the next day at Deeds' office, which he was informed was on the same floor with that of the contracting officer, Captain Edgar. Accordingly on the following day, May 19, Deeds introduced King to Captain Edgar and in two or three days, on May 23, the contract was signed. As Colonel Edgar testifies: "King was brought down here by Colonel Deeds and recommended to us as a proper contractor, the most available in Dayton for the work."

The following is a portion of the correspondence between Deeds and Talbott relating to this contract:

Telegram Deeds to Talbott, May 23, 1917:

Washington, D. C., May 23, 1917.

H. E. Talbott,  
City National Bank Building,  
Dayton, Ohio.

King probably returns to Dayton this evening. He is undertaking something which he alone is unable to get through with. It will be important that you give him a vision of this job and some very definite suggestions how to hit it in a big way. This is the biggest undertaking that has ever been put across in Dayton.

E. A. Deeds.

Telegram Deeds to Talbott, May 23, 1917:

H. E. Talbott,  
Dayton, Ohio.

Washington, D. C., May 23, 1917.

Suggest you personally direct publicity regarding contract to be given soon, so that it will avoid criticism and at the same time tell the story. This is particularly vital because of Captain Waring to start work Friday and the visitors whom I am bringing, who may read the papers. Your good judgment is needed on this.

E. A. Deeds.

Telegram Deeds to Talbott, May 24, 1917:

H. E. Talbott,  
City National Bank Building,  
Dayton, Ohio.

Washington, D. C., May 24, 1917.

—ranging for contract do not overlook a local contractor

and lumber man in Osborne. Ezra Kuhns knows his name. He has been friendly to us and I promised him something to do on this job.

E. A. Deeds.

Telegram Talbott to Deeds, May 28, 1917:

May 28, 1917.

E. A. Deeds,  
Care New Willard,  
Washington, D. C.

Just to remind you chartered accountants of Government selection, expense to be paid by contractor and charged to cost of work. Piece work for labor only on various unit sections in various classification of work, will do much towards speed and economy. Each individual transaction to have the approval of officer in charge before it is effected.

H. E. Talbott.

Telegram Deeds to Talbott, May 31, 1917:

May 31, 1917.

H. E. Talbott, Sr.,  
Dayton, Ohio.

Wire what progress has been made on Dayton field. This is for our report to the council. If foundations have been started, for instance, and how many men on the job. This only needs to be a rough estimate.

Deeds, Aircraft Production Board.

Telegram Talbott to Deeds, June 1, 1917:

Deeds,  
Aircraft Production Board,  
United States War Department,  
Washington, D. C.

June 1, 1917.

Steam shovel and large trench digging machine now in place. Three cutting gangs at work. Teams and tractors on ground. Carpenters finishing sheds and office for construction purposes. Foundation excavations in progress. Have plant and equipment for six concrete gangs which will be at work early in the week. Sidewalks progressing. Repairing highways to facilitate trucking operations from Dayton. Purchased five new Packard trucks to augment transportation over the existing available trucks. Next week will see everything booming along. All material, lumber, cement, planks, board, roofing, located and on the way. Wish you would think over method of authority which can be given me to rush transportation of railway cars. This looks like the main point of congestion. All departments of construction now organized with experienced and competent supervisors and foremen. All this in spite of the fact that it has rained every day since Waring has been here.

H. E. Talbott.

Despite the indication of these messages, and of his transactions with King, Mr. Talbott testifies positively that he had no interest in the enterprise, except as a citizen of Dayton, and got nothing out of it beyond 6 per cent interest received by the Dayton Metal Products Co. on money loaned.

King had no capital available for the enterprise, nor had the Dayton Lumber & Mfg. Co. King's testimony is:

Q. Did you have the capital to swing that? A. Not without assistance.

Q. Where did you expect to get the assistance? A. When I talked to Mr. Talbott he told me on the Saturday afternoon, I said, "Well, this will take a good deal of money." He said, "Yes, but," he said, "you need not worry about that. We will work out some way for that." He said, "I do not know how we will work it out, but we will work out some way for that."

The financial assistance that King needed was obtained upon the credit of the Dayton Metal Products Co., supported by the personal guaranties of H. E. Talbott and C. F. Kettering. Notes of the Dayton Lumber & Mfg. Co. to the extent of \$400,000 were discounted by the Dayton Metal Products Co. with the American Exchange National Bank of New York. It was originally contemplated that these notes should be endorsed by Deeds and Talbott, as is shown by the following extract of a letter to Mr. Talbott from W. H. Bennett, vice-president of the American Exchange National Bank, under date of June 25, 1917:

Referring to the conversation which the writer had with you on Thursday, I have conferred with Mr. Kenzel, Assistant Cashier of the Federal Reserve Bank, and upon your statement that the Dayton Lumber & Mfg. Co. is under contract with the United States Government for the preparation of the aviation field at Dayton, and that said company is to receive payments on the tenth of each month on the presentation of receipted vouchers for work completed in the previous month; and that it is the intention of the Dayton Metal Products Co. to make advances to said Dayton Lumber & Mfg. Co. of amounts necessary to carry on the work, he ruled that the paper executed by the Dayton Lumber & Mfg. Co. and endorsed by the Dayton Metal Products Co. to cover said funds so advanced will be eligible for rediscount with the Federal Reserve Bank.

Therefore, we feel that it will probably be of mutual advantage to provide for the advance of \$400,000 requested from us by a three months' note executed by the Dayton Lumber & Mfg. Co. to the order of the Dayton Metal Products Co. and endorsed to Mr. H. E. Talbott and Mr. E. A. Deeds. If you so desire, the endorsement of the individuals can be secured by an assignment from the Dayton Metal Products Co. of certain securities now in safe keeping with us to the individuals referred to.

It was subsequently arranged that the endorsements should be those of Talbott and Kettering, who also gave their separate agreement of guaranty. The avails of discounted paper were passed by the American Exchange Bank to the credit of the Dayton Metal Products Co.

It appears from the accounts between the Dayton Lumber & Mfg. Co. and the Dayton Metal Products Co. that, while the latter company ultimately paid the notes, their proceeds were used in large part from time to time for the benefit of the Dayton Metal Products Co.

The credit to the Dayton Lumber & Mfg. Co., thus extended to it upon its notes, was furnished without security, or, as Mr. Talbott put it, with "no further security except in the man (King). I trusted the man; I knew his contract." After the contract had been obtained, King increased his stockholdings in the Dayton Lumber & Mfg. Co. by the purchase of 104 additional shares, borrowing for the purpose \$20,000 from the Dayton National Bank.

It appears that the total amount paid by the Government under the contract with the Dayton Lumber & Mfg. Co., to Aug. 14, 1918, amounted to \$3,115,161.94. This represents the amount paid for the cost of the work, that is, for lumber, materials, etc. The commission or profits of the contractor, which had been paid to that date, amounted to \$102,436.04.

There has been considerable trouble in connection with the contract, and the accounts are far from being in satisfactory shape. An audit of the books of the company was made by Barrow, Wade, Guthrie & Co., to Nov. 30, 1917.

They reported that they found "the payrolls very incomplete, full of errors, corrections and erasures," and that there was "abundant evidence that great laxity and carelessness has been exhibited by the employees of the company, especially those in the paymaster's department."

These statements are amply confirmed by the evidence in this investigation, and the accounts are in course of being reaudited by Government accountants.

The consideration of the various irregularities in the accounts and of the questions to which they give rise must await the result of this examination. It will be observed that the Government has withheld a large part of the compensation of the contractor until a satisfactory adjustment has been made.

Of the profits received from the Government, it would appear that the moneys have been retained in the business of the company, except to the extent of a dividend of \$37,500, that is, 50 per cent on the capital stock.

Of this dividend, King was entitled, on the 251 shares acquired in his name, to \$26,050, and of this amount it appears that he had received 70 per cent, or \$18,235, to July 1, 1918. He had paid \$11,000 on account of his loan (\$21,000) to the Dayton National Bank.

He had paid nothing on the \$60,000 loan from the City National Bank. No agreement has been proved for a division of profits on this contract, and there is no proof that Colonel Deeds has had an interest in the contract or in the Dayton Lumber & Mfg. Co.

Even if it appeared that the Dayton Metal Products Co. was interested in the contract (which would explain transactions otherwise difficult to understand), this fact would not affect Colonel Deeds unless he were found to be interested in that company. The question would thus come back to the transfer of his stock in the Dayton Metal Products Co., which has already been considered.

#### McCook Field (formerly known as North Field)

This is a field of approximately 200 acres in and adjacent to Dayton, which was leased by the Government from the Dayton Metal Products Co., and has been used for the purpose of making various tests. Lieut.-Col. Vincent first suggested another field (South Field or Moraine Field), and brought the matter to the attention of Colonel Deeds, by whom that field was principally owned. On Sept. 27, 1917, Colonel Deeds sent the following telegram to Mr. Talbott:

Washington, D. C., Sept. 27, 1917.

Mr. H. E. Talbott,  
City National Bank Building,  
Dayton, Ohio.

Colonel Clark takes letter regarding Moraine flying field with him to Dayton to-night. George McCann has another letter, for Mr. Kettering. Government will lease land, put up buildings and operate experimental field. Lease will be for three years without privilege of purchase, as that is not necessary. Have complete description of property prepared, also statement of cost of buildings already erected and suggest monthly rent arrangement and have George McCann bring them to Washington to complete lease. Have him prepare deed for this property to Mr. Kettering, who in turn, will lease it to the Government.

DEEDS, Equipment Division.

Talbott and Kettering refused to consent to this use of South or Moraine Field, as it was said to be needed for experimentation in connection with the Dayton Wright Airplane Co., and they suggested North Field, or what afterward became known as McCook Field.

The latter tract had originally been purchased by Deeds and Kettering, each of them bearing one-half of the cost, and they had made some improvements, such as leveling, removing trees, etc., and had erected one or two small buildings. The object of their purchase had been to develop a training field for airplanes to be used by civilians, but this project could not be carried out.

The suggestion was that this parcel, with approximately

82 acres of land adjoining, which was owned by the Dayton Metal Products Company, would be suitable for the Government's use as an experimental station. Deeds did not wish to be a party to the lease, and conveyed to Kettering his undivided one-half interest in the parcel owned by them in common, and Kettering then conveyed that parcel to the Dayton Metal Products Co., which thereupon leased the entire tract to the Government.

The lease was dated Oct. 4, 1917. Colonel Deeds was present at the conference at which the terms were settled, and sent the following telegram to Talbott on Oct. 3:

Washington, D. C., Oct. 3, 1917.

Mr. H. E. Talbott,  
City National Bank Building,  
Dayton, Ohio.

Have worked out a lease for the North Dayton field twelve thousand eight hundred dollars a year without cash payment. It is the best thing that can be done under the circumstances and suggest its acceptance. Craighead will discuss it with you in detail when you see him.

DEEDS, Equipment Division.

Lieut.-Col. Edgar, under the authority of the Chief Signal Officer and the approval of the Chief of Staff and of the Assistant Secretary of War, signed the lease on behalf of the Government. The rental is at the rate of \$12,800 a year, with an option of renewal from year to year until June 30, 1921. There is no option to purchase; the lessor agrees that at the expiration of the lease the lessee may remove the structures and improvements erected by it upon the premises.

The contract for the development of the field was made with the Dayton Lumber and Manufacturing Company, notwithstanding the fact that the contractor had failed to give satisfaction in connection with the Wilbur Wright Field. This is explained by Colonel Edgar as follows:

We had an organization at the Wilbur Wright Field. We had practically reorganized King's force, and it was determined to take them over to McCook Field, which was brought to us by Colonel Deeds as a rush job which must be done immediately. He personally brought the proposition to me as a proposition that had to be put through immediately. They had no place to test the planes that were coming out. We did not pick out McCook Field; we had nothing to do with its location. A contract was made for the rental of the ground of the McCook Field, and we were importuned to take our organization over there with this contractor and finish this job up and it was done.

Q. Importuned by whom? A. By Colonel Deeds.

The total amount expended by the Government upon McCook Field to Aug. 14, 1918, amounts to \$949,085.35, and the contractor's compensation is 7 per cent of the cost with a maximum limit of \$46,200. The amount paid to that date as contractor's profit was \$26,667.65. The remaining portion of the total compensation has been withheld awaiting the audit of the contractor's accounts.

There is no proof that Colonel Deeds has had an interest in the contract for the development of this field. Nor does it appear that he had an interest in the lease executed by the Dayton Metal Products Company to the Government, or in the rent reserved. While Colonel Deeds originally owned a part of the tract leased to the Government, he conveyed—by what purported to be an absolute sale—his interest to Kettering, and was not interested in the lease by Kettering's grantee, the Dayton Metal Products Company, unless he was interested in the stock of that company, a question already considered.

It is understood that the amounts advanced by Deeds in connection with the development of that portion of the tract in which he had an undivided one-half interest were taken into account in the settlement that was made in November, 1917, when the amount to be paid (by notes) to the Domestic Building Company for the plant acquired by the Dayton Wright Airplane Company was determined; but this fact is not sufficient to establish an interest in the lease so as to bring the matter within the range of the Federal penal statute.

#### South Field or Moraine Field

This is a tract of about 110 acres lying south of the city of Dayton, and a short distance from the plant of the Dayton Wright Airplane Company. The greater portion of the land belongs to Colonel Deeds. It has been improved by the erection of a number of hangars and other buildings. This land was leased about Nov. 30, 1917, to the Dayton Wright Airplane Co. for a period of three years, at a rental of \$1 per year. It is used by that company as a place of experimentation. The expenditures for hangars and improvements upon South Field which had been made by Colonel Deeds had been taken into account in the settlement made with the Domestic Building Company.

#### Acceptance Field

This is a field lying close to the plant of the Dayton Wright Airplane Company, upon which the airplanes it manufac-

tures for the Government are taken out for trial. The greater part of this field belongs to the Moraine Development Company, and it appears that Deeds is interested in this field as a stockholder in that company. Deeds and Kettering each hold 2055 shares out of a total of 10,003 shares, the majority of the stock being held by Adam Schantz. This field is leased to the Dayton Wright Airplane Co. The transactions relating to South Field and Acceptance Field were with the Dayton Wright Airplane Company and not with the Government.

### (3) Colonel Sidney D. Waldon

During the period in question Colonel Waldon was a stockholder in the Packard Motor Car Company. This interest he retained, but he disclosed it to the Aircraft Production Board at its meeting of Aug. 27, 1917, and to the Secretary of War, and it does not appear that he took part at any time in any proceedings of the board or in any other transactions in relation to the Packard company. No interest on his part in any other concern having dealings with the Government is shown.

### (4) Colonel Robert L. Montgomery

At the time Colonel Montgomery entered the service of the Government he was one of the directors of the J. G. Brill Company of Philadelphia, holding one share of common stock.

Colonel Montgomery states that he resigned from the board of directors and sold his share of stock on Sept. 22, 1917, before any contract was made by that company with the Government, and that he did not negotiate the contracts in which that company is interested. Colonel Montgomery further states that at the time he entered the Government's service it was agreed with his partners that no member of the firm should have any interest in any concern connected with aircraft work.

It appears that the wife of one of his partners held for some time 200 shares of the stock of the Curtiss Aeroplane and Motor Corporation, which she had purchased in her own right, and then sold it, and that subsequently she bought some 500 shares of the stock of the Wright-Martin Aircraft Corporation. With these transactions Colonel Montgomery had no connection.

Colonel Montgomery's firm (Montgomery, Clothier & Tyler), in August, 1917, took an interest of \$250,000 in an underwriting syndicate through the National City Co., for the flotation of \$5,000,000 six per cent. notes of the Electric Auto-Lite Corporation. Later, Montgomery, Clothier & Tyler issued a circular offering the notes for sale to the public. These notes of the Electric Auto-Lite Corporation were secured, in part, as the circular states, by a specific pledge of collateral among which were shares, amounting to \$12,500,000 in par value, of the common stock of the Willys-Overland Co.

The Farmers' Loan and Trust Co., of New York was made trustee to receive the pledge. The sale of all the notes was completed by Sept. 12, 1917, \$116,000 being sold through Montgomery, Clothier & Tyler, who received \$8,500 in settlement of their interest in the underwriting. Colonel Montgomery states that this transaction, with others, was undoubtedly mentioned to him by his partners at or about that time, but that he never saw the circular or had the transaction fully explained to him until May of this year.

In August and September, 1917, at the time of this transaction, Colonel Montgomery on behalf of the Government was negotiating contracts with the Willys-Overland Co., for the manufacture of engines for training planes. The Willys-Overland Co., not only made these contracts, but also had a substantial interest in the Curtiss Aeroplane & Motor Corp., which at the time had contracts with the Government for airplane engines.

While the Electric Auto-Lite Corp. was affiliated with the Willys-Overland and Curtiss companies, the transaction in question concerned the flotation merely of notes of the Electric Auto-Lite Corp., and the interest of purchasers of these notes in the stock of companies having dealings with the Government was only through the pledge of the Willys-Overland stock as collateral security.

It appears that while Colonel Montgomery's firm took part in the sale of the notes as members of the underwriting syndicate, none of the notes were actually purchased by his firm, either for firm account or for any individual partner, and in these circumstances it is believed that there would be no sufficient ground for holding the above-quoted statutes to be applicable.

Apart from the above matter there is no evidence that Colonel Montgomery has had an interest in, any corporation,

association or firm with which he has dealt as an officer or agent of the Government.

## OTHER OFFICIALS

### Lt.-Col. Jesse G. Vincent.

In April, 1917, Mr. Vincent was vice-president of the Packard Motor Car Co., in charge of engineering, with a salary of \$25,000 a year. Under his contract with that company, made in 1912, he was entitled to subscribe for certain shares of its stock. On Aug. 15, 1917, having resigned his office, he made a settlement with the company, receiving his salary to that date and a bonus of \$5,000 for the preceding year's work, and at the same time, through the exercise of his option, he acquired \$15,000 of common stock at par which with the stock dividends previously declared thereon gave him approximately 347 shares.

He had purchased outside about 82 shares, so that he became a stockholder in the Packard Motor Car Co., to the extent of 429 shares of the common stock of the par value of \$42,900. This stock he has continued to hold since August, 1917; he has received dividends of 1% per cent. quarterly with the exception of one quarter for which a dividend was passed.

From about May 27, 1917, until Aug. 15, 1917, Mr. Vincent, while paid by the Packard Company, was actually at work for the Government in the development of the Liberty Motor. It is said that for this period he was 'loaned' by his company to the Government.

On Sept. 3, 1917, he received a commission in the Army with the rank of Major and later he was raised to the rank of Lieutenant-Colonel. About July 1, 1917, he was put in charge, as a civilian, of the Engine Design Section of the Signal Corps and he remained in this service after he was commissioned and until Oct. 1, 1917.

On the latter date, the Airplane Experimental Department of the Signal Corps was established in charge of Lt.-Col. Clark, with headquarters at McCook Field, Dayton, and Major Vincent was associated with this department as its executive officer with his office at the Lindsey Building, Dayton. On February 6, 1918, he was put in charge of the Airplane Engineering Department at Dayton and in command of McCook Field. He is now in charge of the Airplane Engineering Division of the Bureau of Aircraft Production.

Both before and after Major Vincent received his commission in the Army, he had transactions with the Packard Motor Car Co., in which he acted on behalf of the Government. On June 6, 1917, the Aircraft Production Board adopted a resolution which provides, after recitals, as follows:

Therefore, Be It Resolved, That the Board proceed immediately to secure space wherein to bring together sufficient draftsmen under a competent engineering organization to produce complete designs of 8 and 12 cylinder motors, to be known as the US-8A and US-12A respectively; that the design for the 4 and 6 cylinder motors follow as soon as practicable, these motors to be known as the US-4A and US-6A respectively. These designs and drawings to be made to include the designs and drawings for the special tools necessary to produce the parts of these motors. The Board should undertake to have the parts made wherever in its judgment they can be most quickly and advantageously done and have them sent to Washington and assembled here in space to be secured, parts to be made for Five (5) US-12A and five (5) US-8A.

And Be It Further Resolved, That the Board recommend to the Office of the Chief Signal Officer that the sum of \$250,000 be immediately set aside to carry on this work and that a disbursing officer be assigned to handle this fund.

This allotment, or \$249,159.10, was paid to the Packard Motor Car Co. for drawings, models, tests, etc., and for six US-8A's and five US-12A's which were to serve as standardized engines. No written contract for this work or written order for this work setting forth unit prices or specifying the terms on which the work was to be performed is found in the files of the Signal Corps, and in this respect the proceeding was very irregular. Instead of there being an appropriate agreement or written order, it appears that verbal orders were given from time to time by Mr. Vincent, which, it is testified, were confirmed in conversations with Mr. Deeds.

The first voucher presented by the Packard Company for this development work was for \$104,500, which was paid on Aug. 11, 1917, upon a certificate of Mr. Deeds, then a civilian in charge of the Equipment Division. While Mr. Deeds was familiar in a general way with the work, it does not appear that he or any one else acting for the Government, except Mr. Vincent, had detailed information as to what had been done or as to actual cost.

The exact amount of the outlays could not then be stated either by the company or by Mr. Vincent and, while definite amounts were placed opposite particular services and engines described in the voucher, these amounts were mere estimates.

The voucher did not so state, but the payments were virtually payments on account. Included in this first voucher (paid Aug. 11), were the salaries and traveling expenses, as estimated, of those in the engineering organization which Mr. Vincent had effected for this development work, including the salary of Mr. Vincent himself after he came to Washington as above stated. As he testified:

In other words, this item was intended to cover not only the making of drawings, but the moving of engineers here to date and also a lot of traveling expenses incident thereto . . . that was all lumped under original design work. Q. Was there any itemization of that anywhere? A. There was not, because it was impossible to make any such itemization. I knew roughly what it would cost. Q. How much of that amount of \$37,000 included in that voucher (that is, the voucher for \$104,500) was for salaries? A. I should say about one-third. Q. For what period were those salaries allowed? A. They were allowed for the period that the men were actually on the job.

Q. Is your salary included in the \$37,000? A. I think it is.

Another voucher in similar form for \$73,194.72 was presented by the Packard Co., on Nov. 20, 1917. It was accompanied by a letter from Major Vincent, representing the Engine Design Section of the Signal Corps, to Colonel Deeds which stated:

I have personally supervised this work and hereby certify that all of the above material has been delivered to the Government and is now being used for Government purposes.

The prices at which the engines are billed are only approximately correct and may be high or low, but this cannot be determined until a final checkup is made when the job is completed. There are several engines yet to be delivered and before we pay for the final ones, I will arrange to have a checkup made in order to insure that the total amount paid for the entire job is entirely fair to both the Government and the Packard Motor Car Company. I would ask that payment be made the Packard Motor Car Company promptly in this connection, as they are going to a great deal of trouble to do this experimental work for us.

A third voucher for \$60,000, for three engines, which was also a mere estimate, was paid on Dec. 6, 1917, on Colonel Deeds' certificate.

The fourth, and final, voucher was paid on Jan. 19, 1918, for the two remaining engines, which were put down at \$5,732.19 each so as to bring the total amount expended for the development work within the above-mentioned allotment of \$250,000. The Packard Company at this time submitted an itemized statement of its outlays which Major Vincent examined and approved. This statement purported to show the total cost of the entire work, that is the cost of material, and of labor, the direct expense (including travelling and other expenses of the organization which Mr. Vincent brought to Washington for the purpose of working on the design of the Liberty Motor) and the overhead charges. These items aggregate \$221,474.75, to which a profit of 12½ per cent (\$27,684.35) was added, making a total of \$249,159.10. Major Vincent wrote the following letter to Colonel Deeds in submitting the final voucher with his approval of the itemization of cost.

Dayton, Ohio, Jan. 19, 1918.

From: Major J. G. Vincent, Airplane Experimental Engineering Department, Lindsey Building, Dayton, Ohio.  
To: Colonel E. A. Deeds, Southern Railway Building, Washington, D. C.

Subject: Final Payment on the Liberty Engine Development Order.  
1. I am enclosing herewith bills from the Packard Company for the last or No. 6 8-cylinder engine, and the last or No. 5 12-cylinder engine. These bills have been held in abeyance until the Packard Company could furnish us with a final accounting covering the cost of the job.

2. You will remember that the joint Army and Navy Technical Committee set aside an appropriation of \$250,000 to cover the cost of this job. At the time they set aside this amount and asked me to have ten engines built, I was afraid it could not be done within the appropriation, but am glad to be able to advise you that altogether we built eleven engines, as well as two wooden models, and ran several tests under this order and still kept within the appropriation. You will note that the last two engines are built at \$5,732.19 each, as this just balances out the net cost to the Packard Company plus 12½ per cent profit.

3. As a matter of general information I want to point out that the Packard Company co-operated with us to the limit on this job, and many of their executives gave a great deal of their time to this work for which they received no pay whatsoever. It is also a fact that this work was put ahead of a great deal of other work, causing losses which can never be computed. They did this cheerfully because their heart was in the job, and my only object in mentioning it is to, in some degree, give them credit for their attitude, as I know no one at Washington can possibly realize what this brand of co-operation costs.

4. I want to go on record as stating that I do not know of any other place in the world where this job could have been done at anything like this cost.

5. During the last two years that I was with the Packard Company they spent approximately a half million dollars on aircraft development work—the spending of this money not only put me in position to know what should make an aircraft engine, but it also resulted in the development of an organization at the Packard plant which was ready and waiting to grab this Liberty job. I think you will find the brief résumé of costs entirely satisfactory, but I simply want to state that the Packard Company, of course, have a complete record of all the transactions, if they should ever be required. I think, however, that this job is so obviously reasonable that nothing else will be required. I want to urge that you have final payment made to the Packard Company immediately, as they are

carrying on a lot of development work for us and are, therefore, carrying considerable investment at all times.

(Signed) J. G. VINCENT.  
Major, S. C., U. S. A.

The irregularity of proceeding in this manner without a contract or proper order in writing is apparent. No price had been fixed for the work or materials; if only outlays were to be reimbursed, it was necessary that outlays should be appropriately proved before payment was made, and this had not been done in the case of the first three payments.

Nor does it appear that at the time the first voucher for \$104,500 was passed, on or about Aug. 11, 1917, Mr. Deeds had any authority in the absence of a written contract or a proper written order to give the certificate. The Chief Signal Officer testifies that he did not have such authority. Nor was his certificate itself accurate in its terms, as there was no agreement for a price, and if there was an agreement for the reimbursement of actual outlays, the voucher, being a mere estimate, was not in accordance therewith.

It should be said, however, that the evidence does not afford ground for the conclusion that the Government was defrauded or that there was any intent to defraud the Government on the part of any of the parties concerned.

The work was development work, these first engines being made by hand in advance of tooling up for quantity production in order to standardize the design, and it does not appear that the services rendered were not worth the amount paid or that the estimates of the outlays were not fair estimates; that is, that the amounts as estimated were not actually expended as set forth in the final statement.

Both Major Vincent and Mr. MacCauley, the president of the Packard Motor Car Co., testify that the amount paid under these vouchers as finally adjusted did not embrace any expenses incurred in the original work of the Packard Company in developing an aircraft engine, that is, prior to the time when Mr. Vincent came to Washington on May 27, 1917. Viewed as an arrangement for services on a cost plus basis, the allowance of profit does not seem to be excessive. While the vouchering was irregular, there is no sufficient basis for a charge under the statutes relating to false and fraudulent vouchers or the facilitating or obtaining of payments with intent to defraud the Government.

A distinct question, however, is presented as to Lt.-Col. Vincent. Section 41 of the Criminal Code explicitly prohibits any person who is directly or indirectly interested in the pecuniary profits or contracts of a corporation from acting as an officer or agent of the United States for the transaction of business with such corporation. It is manifest that Lt.-Col. Vincent acted as an officer and agent of the Government for the transaction of business with the Packard Motor Car Company in which he was a stockholder, and that this was in violation of the statute.

Lt.-Col. George W. Mixer

Lt.-Col. Mixer, formerly vice-president of Deere & Co. of Moline, Illinois, manufacturers of agricultural machinery, came to Washington in July, 1917, to undertake the organization of the Inspection Department of the Aircraft Engineering Division of the Signal Corps. He was later chief of the Inspection Department of the Equipment Division of the Signal Corps. He was commissioned as an officer in the Signal Corps, with the rank of Major, about Aug. 15, 1917.

The work of the Inspection Department covered the inspection or acceptance of material and manufactured articles furnished to the Signal Corps, including the inspection of airplanes and engines manufactured under contracts with the Government.

As chief of the department, Major Mixer dealt with the matters of organization and personnel and exercised a general supervision over the department in matters of administrative policy. In May, 1918, Major Mixer was made Production Manager and on the reorganization which resulted in the establishment of the Bureau of Aircraft Production he continued to carry the title of Production Manager, being directly under Archer A. Landon, who is Director of the Production Division which is broadly charged with the actual execution of the aircraft program after the receipt of engineering data.

Prior to his connection with the Government, Mr. Mixer held 25 shares (par value \$2,500) of the preferred stock of the Curtiss Aeroplane and Motor Corporation. He has not disposed of this stock. He testifies that he had sold his common stock in the company about two years ago and that he had not given thought to the retention of the few preferred shares; that his personal accounts are kept at his office in Moline, and are in charge of his secretary.

The Curtiss company had important contracts with the Government for the production of aeroplanes and Lt.-Col. Mixer was in charge of the organization of the inspection materials and products at its plant as well as at other

and he visited the Curtiss plant from time to time in the exercise of his authority as head of the inspection department and as production manager, and as an officer of the Government dealt with such questions at this plant as required attention.

The statutory phrase "transaction of business" is broad enough to embrace the activity of officers or agents of the United States who are heads of divisions having charge of the inspection of products under contracts requiring the action of Government inspectors in course of performance.

It would be a narrow construction to hold that the statute (Crim. Code, Sec. 41) is limited to the making of contracts or the placing of orders or transactions relating to payment or discharge. It would seem to be quite as important that the chief of a department of inspection, selecting the inspectors who act under his instructions at the plants of contractors, should be free from interest in the corporation whose work is inspected, as the inspectors themselves, and both the chief of an inspection department and the inspectors may properly be regarded as agents of the Government for the transaction of business with the corporation.

The same would be true of the production manager having supervision of production under contracts with the Government. No ruling in the Federal Courts with respect to the applicability of the statute to such an officer or agent of the Government has been found. In the view that the statute has the scope suggested, Lt.-Col. Mixer acted as an officer or agent of the United States, contrary to the prohibition, for the transaction of business with the Curtiss Aeroplane and Motor Corporation, in which he was a stockholder. His holdings were small, but it cannot be said that for that reason the statute is inapplicable.

#### Major Howard C. Marmon

Major Marmon joined the Signal Corps about June, 1917, and almost immediately was sent to Europe with the Aeronautical Commission. On his return he was assigned to duty with the Airplane Experimental Department at McCook Field, Dayton. Prior to his service with the Government he was vice-president and engineer of the Nordyke & Marmon Co. of Indianapolis, which was engaged in manufacturing mill machinery and motor cars, and he held \$15,000 in par value of the stock of that company, its book value being several times its par.

On entering the Army, he gave to his brother a power of attorney to dispose of his shares and they were transferred to his mother, Mrs. Elizabeth C. Marmon, and have since stood in her name. The transfer was a gift; Major Marmon testifies that he has no interest in the stock. His mother turns over to him the income of other property which is the equivalent of the salary he had previously received from the Nordyke & Marmon Co.

The Nordyke & Marmon Co. has a contract for 3000 Liberty engines, and spare parts, and previously had a contract, which was filled, for 1000 Hall-Scott engines and spares. The evidence is that Major Marmon had no part in the negotiations relating to these contracts or with the supervision of inspection, production or payments.

He has been engaged in the airplane experimental department, or engineering department at McCook Field. It does not appear that he has had any transaction with the Nordyke & Marmon Co. save that he sent to that company, with others, from McCook Field, the blueprints for the Liberty engine.

It also appears that he signed a communication from McCook Field relating to a Marmon automobile which had been ordered by Lt.-Col. Vincent for that department. Taking all the facts into consideration, there is no sufficient ground for a charge of violation of the statute in his case.

#### Second Lieut. Samuel B. Vrooman, Jr.

In a subsequent portion of this report, reference is made to the Mahogany Manufacturers and Importers Association, a voluntary association of the leading mahogany manufacturers of the United States, which was formed last January in connection with negotiations for the purchase by the Government of mahogany for airplane propellers.

One of the members of the association is the S. B. Vrooman Co. of Philadelphia. Second Lt. Vrooman is the son of Samuel B. Vrooman who was head of this company until his death a short time ago. Second Lt. Vrooman is thirty-one years of age and for upwards of nine years was at work in his father's company handling lumber, inspecting and selling. On his marriage in June, 1917, his father gave him \$10,000 in par value of the company's stock, which for some years has paid 20 per cent dividends annually.

This stock he still holds. In addition to the dividends on his stock, the S. B. Vrooman Co. has continued to pay him, since he entered the service of the Government, the sum of \$50 a week, which is the equivalent of the compensation

he previously received for his services to the company.

In December, 1917, S. B. Vrooman, Jr., became identified with the Equipment Division of the Signal Corps as a civilian and was made an inspector of mahogany purchased by the Government. In February, 1918, he was put in charge of the inspection of all propeller lumber. He selected the district officers, who in turn selected the inspectors.

Mr. Vrooman issued instructions to the district officers, visited the plants to see that the inspectors were doing their duty, and passed on disputed points. He has continued in this service and in July, 1918, received a commission as Second Lieutenant.

Among the plants subject to his jurisdiction as head of inspection of propeller lumber is that of the S. B. Vrooman Co., which has had contracts with the Government and is within the territory assigned to the district office at New York. S. B. Vrooman, Jr., selected the head of this office, Mr. McCullough, who was responsible to him for the efficiency of the inspection and for the carrying out of his instructions, which related to the inspection at the Vrooman plant as well as others.

The conclusion is not to be escaped that S. B. Vrooman, Jr., was the agent of the Government directly responsible for the proper inspection of the mahogany delivered by the S. B. Vrooman Co. to the Government under its contracts, and that his acting as such agent for the transaction of business with the corporation in which he was a stockholder was in violation of the statute.

#### FOURTH. THE AIRCRAFT PROGRAM

At the time of our entry into the war we had no combat planes, and only a few planes for training and scouting purposes. Approximately 100 airplanes had been delivered to the Army up to the year 1917. There were few flyers and still fewer who had any acquaintance with aviation engineering. The airplane manufacturing industry was in its infancy in this country. But these difficulties were not cealed. The necessity of prompt endeavor to surmount them and of securing at once the full benefit of foreign experience was obvious.

On May 22, 1917, the Joint Army and Navy Technical Aircraft Board, consisting of officers of the Army and Navy especially qualified by reason of aeronautical experience, made a series of recommendations to the Secretary of War and the Secretary of the Navy, which were duly approved by each secretary. It was recommended that there should be purchased by the Army (from the Curtiss Aeroplane and Motor Corporation) "700 Curtiss JN-4 advanced training planes, equipped with the Curtiss OX-5 engines, with 50 per cent extra engines and appropriate amount of extra engine and airplane spares." The purchase of 100 Gnome engines (40 for the Navy and 60 for the Army) from the General Vehicle Co. was also advised. It was recommended "that no action be taken on the suggestion by the Aircraft Production Board for the purchase of the Standard J airplanes, pending tests of this machine by Army flyers." Other recommendations were as follows:

9. The Board recommends that the Aircraft Production Board take immediate steps to obtain complete working drawings, complete machines for use as samples, and to arrange for the manufacture in this country of the following airplanes and engines:

##### AIRCPLANES

- Sopwith, 1 1/2 strutter.
- Spad, 1-place pursuit type.
- S. E. 5, 1-place pursuit type.
- Sopwith, 130-hp. Clerget, 1-place pursuit type.
- D. H. 4, 2-place reconnaissance.
- B. E. 2 D, 2-place reconnaissance.
- White, Gnome pusher, seaplane.
- Two types of Fairley seaplanes; 130-hp. Clerget type and also a Campania type.
- Farman, with a 150-hp. Hispano Suiza engine, seaplane.

##### ENGINES

- Lorraine-Dietrich 250 hp.
- Clerget, 130 hp.
- Hispano Suiza, 200 hp.
- Rolls-Royce, 270 hp.
- B. H. P. 200 hp.
- Gnome Mono-soupape, 170 hp.

The same Board on May 23 made further recommendations to the Secretary of War and Secretary of the Navy, which were also approved, as follows:

3. It is estimated that the needs of the United States Army for heavier-than-air aircraft until July 1, 1918, will be as indicated hereinafter and it is recommended that a building program to accomplish these needs be started at once.

## TRAINING

Under the present conditions in order to meet the needs of the United States Army only.

Type of Airplane	Number Required	Type of Engine	Number Required
J. N.-4	3,500	OX-5	7,000
DeH.-4	1,750	R-R or equivalent	3,500
S E-5	800	H-S	1,200
S.P.A.D.	800	H-S	1,200
Sopwith	800	Clerget 130	1,200
J. N.-4	800	Hall-Scott A-7-a	1,000

(Stop gap order)

In the event that the United States are called upon to train foreign flyers in addition to United States Army flyers.

Type of Airplane	Number Required	Type of Engine	Number Required
J. N.-4	5,000	OX-5	10,000
DeH.-4	2,500	R-R or equivalent	5,000
S E-5	800	H-S	1,200
S.P.A.D.	800	H-S	1,200
Sopwith	800	Clerget 130	1,000

airplanes and engines shown on the attached table, which also includes a schedule of guaranteed deliveries.

You will also find annexed a schedule of approximate prices of these airplanes and engines and a draft of the proposed agreement between the American and French governments which is now in the final stages of execution, although the orders have been actually placed by the French Government with its manufacturers. This agreement has been prepared after conference with the Judge Advocate General and his staff here and considerations of the arrangements under which England is having engines built in France.

## Foreign Orders

Accordingly Major Bolling reported that the following orders had been placed abroad:

## IN FRANCE:

## Training Airplanes:

725 Nieuports with Le Rhone engines and 150 Spads with Hispano engines. Deliveries to be in time to meet U. S. training program in France.

## Service Airplanes:

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June
1500 Breguet (Renault & Fiat)....	60	60	460	460	460	400	550	615
2000 SPAD (200 hp. Hispano)....	..	..	..	135	300	400	550	615
1500 New Spad (150 Gnome)....	..	..	50	100	200	300	350	500

## or

1500 Nieuport (150 Gnome)..... 300 400 400 400 .. ..

## Service Engines:

## IN ITALY:

500 S. I. A. 6 B (reconnaissance and day bombing airplane similar to the Breguet). Deliveries to begin October and be completed in December.

200 to 300 Caproni biplane with the new Isotta-Fraschini engine. Deliveries prior to June 30, 1918.

A formal contract was made between General Pershing and the French Government under date of Aug. 30, 1917, for the 5000 service planes and 8500 engines above described. The French Government entered into this contract upon the express condition that the United States should furnish the machine tools and raw materials which were fully listed.

In order to perform this condition, a contract was made under date of Oct. 4, 1917, by the United States Government with The J. G. White Engineering Corporation, by which the latter was to act as an agent for the purchase of the required materials on the basis of cost plus three per cent as compensation.

It turned out that there was great difficulty in obtaining these materials as the French specifications in important instances could not be met at the time by American manufacturers. While the contract with the French Government called for deliveries of materials for planes two and one-half months before delivery of the finished planes, and materials for engines three and one-half months before delivery of finished engines, and that all materials advanced by the French Production Service should be replaced not later than Nov. 1, 1917, it appears that only 14 per cent of the required materials had been placed at points of embarkation in the United States by Nov. 1, for shipment to France, 46 per cent by Jan. 1, 1918, and 67 per cent by March 1, 1918; 91 per cent was delivered at points of embarkation by June 1, 1918, and 99 per cent before the end of August.

From information recently received it appears that all materials shipped under the contract arrived safely in France and that substantially all have been satisfactory as to quality. For the materials thus delivered during the fiscal year ending June 30, 1918, there had been paid to The J. G. White Engineering Corporation \$9,005,074.31, of which \$8,742,412.29 represents the purchase price and \$262,662.02 the agreed compensation.

It is understood that in December, 1917, in view of the existing conditions, and the serious need for airplanes on the part of the French, the original contract was modified by a new contract calling for about one-quarter of the deliveries within the period contemplated in the first contract. The exact terms of the second contract are not now available here. It is also understood that further orders were placed with the French Government from time to time.

The deliveries originally contemplated on the foreign orders were not made; most likely by reason of the delays on the part of the United States in furnishing the required materials and the increased pressure of the needs of the Allies.

## Deliveries on Foreign Orders

Up to Feb. 1, 1918, it appears that only about 600 planes had been received under the orders placed with the French Government, of which only about 70 were fighters and bombers. The situation as it then existed is disclosed in the cable from General Pershing under date of Feb. 16, 1918:

P. 610 Paragraph 1-A. Dated Feb. 16, 1918.  
Conference to-day between Chief of Air Service A. E. F. and French Under-Secretary of State for aeronautics develops fact that

6. It is recommended that the Aircraft Production Board of the Council of National Defense take steps immediately to advise concerning the formulation of the plans how best to obtain in this country the following airplanes and engines with the designs of these airplanes and engines and the rights to manufacture them in this country.

## Airplanes

Type	No.	Type	No.
DeH.-4	2	R-R	4
S E-5	2	H-S	4
S.P.A.D.	2	H-S	4
Sopwith	2	Clerget	4
		130	
B E 2 C	2	R A F	4
Farman seaplane	2	H-S	4
Martinsyde	2	R-R-190	4
Sopwith	2	Clerget 110	4
1 1/2 strutter	4	R-R	16
Handley-Page twin	4	C U R 92 Rh-110	4
Caproni	2	With engine	4
Savoia	2	With engine	8
Savoia	2		

7. In addition, all such modern German airplanes complete with engines as it may be possible to obtain. These may be obtained either from the Allies or from Holland.

## 8. Additional Engines Desired.

- 4 Lorraine-Dietrich, 250 hp.
- 3 Clerget, 130 hp.
- 2 Hispano Suiza, 200 hp.
- 3 Rolls-Royce, 270 hp.
- 2 B. H. P., 200 hp.
- 4 Gnome Mono soupape, 170 hp.

## Report of Aeronautical Commission

Two months after we had entered the War, an Aeronautical Commission was sent to Europe. This Commission, which sailed on June 17, 1917, in charge of Major (afterwards Colonel) R. C. Bolling, was composed of Army and Navy experts and civilians. Captain Virginus E. Clark and Captain Edgar S. Gorrell represented the Army, and Navy Constructor G. C. Westervelt and Lieutenant Warren G. Child represented the Navy.

Major Bolling's report was sent from Paris on Aug. 15, 1917. The governing principle for the American Production program was stated by Major Bolling to be:

First. The United States must first provide itself with all airplanes and engines required for training purposes in America.

Second. The United States must next provide the airplanes and engines necessary for use strictly in connection with the operation of American forces in the field. It is best known in Washington what will be the size and composition of the American forces in the field at any given dates in the future. You have the information as to the number of types of airplanes required in direct connection with military operations of these forces. We have learned nothing to change the views on that matter which were held by Major Foulois when we left Washington.

Third. After these first two considerations comes the American program of putting into the field next year air forces in excess of the tactical requirements of its army in France. It is greatly desired that the United States shall do this. Such air forces should consist of fighting airplanes and bombers. (Then follows a statement of the proportions deemed advisable.)

The conditions of European production were described; and the advisability of obtaining through foreign orders the supply of airplanes and engines required for use at the front and in training abroad for a period extending to July 1, 1918, was strongly emphasized, as is shown by the following extract from the report:

In our opinion these American needs may be divided into two periods: First period, from the present time to July 1, 1918. Second period, subsequent to July 1, 1918. With every confidence in the ultimate performance of the American production program our investigations of production experience over here and of the sea-tonnage situation have convinced us that airplanes and engines produced in America cannot be actually delivered at the front in any great quantity prior to July 1, 1918. Subsequent to July 1, 1918, we believe that American production will not only take care of our needs but may become a large factor in maintaining the air forces of our allies. In considering the period between now and July 1, 1918, due weight must be given to the experience of all foreign countries and manufacturers in the delays in airplane and engine production which were not and could not be foreseen. Only at close hand can one appreciate how many and how great those delays have been.

After long and careful consideration of this subject we and all others here have come to the very strong conviction that most of the airplanes and engines for American use at the front and for our training here between now and July 1, 1918, must be produced either in France or Italy, where effective and successful methods of production are already in full operation. Because we consider this imperative, and absolutely essential to prevent failure of our air campaign next year, an arrangement has been made with the French Government under which they are to produce for us the

due to non-arrival in France of sufficient raw materials French production of aeroplanes and engines is insufficient to meet needs of French and American air service during the next three months. Nine American squadrons will be available for front line service next month and if military necessity requires that they be put into front line service several of these squadrons must be equipped with inferior types of aeroplanes purchased from the French Government, a procedure which is strongly disapproved. Urgently important every effort be made to expedite remainder shipment of J. G. White & Co. materials destined for France—almost 14,000 tons, and also urgently request no delay in shipment of service aeroplanes from the United States.

PERSHING.

#### Plight of Our Cadets Abroad

There may also be noted at this point the serious delays which occurred in securing adequate provision for the training of American cadets abroad. Hundreds of these cadets were held at concentration camps and other places for several months without suitable training. This was the more regrettable because these students embraced a large number who were exceptionally proficient and who had gone abroad early on the assumption that they would have important and superior advantages in training. It is said that their numbers were larger than the capacity of the French and British schools which it was expected would receive them.

In his cable of March 13, General Pershing speaks of the plight of these cadets as follows:

P. 726, Paragraph 1. Dated March 13, 1918.  
For Chief Signal Officer. Approximately 700 cadets are now under flying training in Europe. These cadets had to wait an average time of three months before commencing flying training. Approximately 700 cadets in Europe awaiting flying training. These cadets have already waited from three to five months for training, and it is estimated that some of them will have to wait at least four months before their training can be commenced. All of those cadets would have been commissioned prior to this date if training facilities could have been provided. These conditions have produced profound discouragement among cadets. In order to remedy injustice and to relieve cadets in Europe on equitable basis of rank with cadets trained in the United States request approval of plan to immediately issue to all cadets now in Europe temporary or reserve commissions in Aviation Section Signal Corps subject to revocation in all cases where on completion of training cadets so commissioned are found not to have requisite qualifications for officers in the Air Service. If plan approved will recommend cadets by groups according to seniority. Strongly recommend approval.

PERSHING.

The Secretary of War observed this condition during his visit to France in the spring and cabled that these cadets should at once receive their commissions, which were to be held subject to revocation if later they were not found to be qualified. General Pershing stated in his cable of March 30, 1918, that this relieved the principal difficulty so far as training was concerned and the situation as it then existed was "difficult because of lack of machines for front and not because of lack of training facilities."

#### Lack of Information Here as to Exact Status of Foreign Orders

Despite constant interchange of cables, information was lacking here as to the exact status of the foreign orders. While cable inquiries had been made from time to time, it appears from a letter written by Lt.-Col. Horner for the Chief Signal Officer to Colonel Bolling, as late as March 12, 1918, that the desired information had not been obtained. There had been apparently an utter lack of an adequate system of communication by which proper records could be kept here of the transactions abroad. Tables and charts of the foreign orders and deliveries were finally received here, but it seems that there still was considerable uncertainty as to the extent of the foreign obligations, and at the beginning of this investigation the extraordinary statement was made by Lt.-Col. S. E. Wolff, then head of the Finance Division, that notwithstanding repeated inquiries, extending over many weeks, he had been unable to ascertain within \$100,000,000 what obligations had been incurred abroad.

#### Agreement with French Government of May 3, 1918

On May 3, 1918, a new agreement was made with the French Government by which the contract of Aug. 30, 1917, was cancelled. Provision was then made by the French Government for the acceptance of orders of the American Government for aeronautical material, and for the acceptance by the American Government of orders of the French Government for raw materials and other supplies.

As these orders would be intended to meet, in the common interest, the military needs of each country presenting them, it was agreed that each Government should fill the orders so far as compatible with its own requirements and resources.

It was further agreed that upon the arrival in France of raw materials included in the contract of Aug. 30, 1917, they should be delivered to the French Government on the assurance that they would be utilized in accordance with the conditions set forth in the new agreement; and also, that until the American Army should be able to meet its own re-

quirements in aeronautical material, the French Government should place at the disposal of the American aviation units, and such instruction units as may be required, the same aviation material as used by the corresponding French units, both as to quality and quantity.

It would seem that by May 23, 1918, there had been delivered by foreign governments for our use abroad about 1400 training planes and about 350 service planes. Since that time there have been additional deliveries and according to a list obtained by General Kenly the approximate number of airplanes received by our forces from European sources to July 31, 1918, were as follows:

School or training planes.....	1617
Service or combat planes.....	1512

#### PRODUCTION IN THE UNITED STATES

##### Recommendations of Bolling Commission

While Major Bolling's Commission, in anticipation of delays here, placed large orders abroad, it is evident that the speediest production in this country that was possible, of a variety of airplanes and engines, was contemplated. The Bolling Commission recommended for production here:

##### AIRPLANES.

Advanced training Bristol Scout with 80 Le Rhone.  
Division or Corps d'Armee Bristol Fighter with 200 Hispano.  
Long Range reconnaissance and day bombing D. H. 4 with Rolls-Royce or some other equivalent engine to be later adopted. Fiat 300 has proved successful here.  
Fighting or Pursuit (fixed engine) Spad with 200 H.P. Hispano.  
Fighting or Pursuit (rotary engine) New Spad with 150 Gnome. (This airplane is now undergoing final tests.)  
Night bombing Caproni Triplane with 3 Isotta Fraschini 270 H.P. engines or other equivalent engine to be later adopted. For very long distance bombing with heavy loads the Italians are now arranging to use the Caproni Biplane with 3 Isotta Fraschini engines instead of the heavier Fiats now used. For distances of 400-500 miles (out and back included) the much greater consumption of gasoline and oil by the Triplane gives it little greater bomb carrying capacity than the Biplane with Isotta-Fraschini engines and the Biplane can be produced much more quickly and in greater quantities. It is also much easier to house at the front. For bombing at shorter distances nothing gives such great bomb carrying capacity as the Triplane.

##### ENGINES.

80 Le Rhone for training purposes.  
200 Hispano Suiza for fixed engine one place fighters and division or Corps d'Armee airplanes.  
150 Gnome Monosoupape for rotary engine fighters.  
Rolls Royce for U. S. production only under some special arrangement of a Rolls Royce factory in U. S. This engine is not considered suitable for great quantity production. It also requires very skillful mechanics to keep it in commission at the front.

While we have investigated many other excellent engines such as Renault, Fiat, Isotta-Fraschini and S. P. A. all of them are too heavy per horsepower to be recommended as engines for great quantity future production in the U. S. Renault, Fiat and Isotta-Fraschini all have new designs now under test which may prove very desirable. The Bugatti engine appears perhaps to offer the most interesting future development for light weight per horsepower and ease of quantity production. The developments with our U. S. engine now under test are probably the most important consideration in this question of engine production in the U. S. Of course, we are without any adequate information over here as to these developments.

##### Recommendations of Army and Navy Technical Members of Bolling Aeronautical Commission

Captain Clark, U. S. A. S. C.; Captain Marmon, U. S. A. R. S. C.; Naval Constructor Westervelt, U. S. N., and Lieutenant Child, U. S. N., the Army and Navy technical members of the Bolling Commission, on their return to the United States made a report to the Secretary of War and the Secretary of the Navy under date of Sept. 4, 1917, which embraced the following recommendations:

23. So far as land airplanes are concerned, the types at present indicated as necessary, are the following:
  - (A) Primary Training—dual control—about 90 H.P.
  - (B) One or two types of machines for training toward the fast fighter—Single seater—using for the present, the 80 H.P. Le Rhone rotary engine.
  - (C) Army observation—two seater—using probably between 225 and 250 H.P.
  - (D) Single-seater fighter—using a rotary engine of about 170 H.P. (If a water-cooled engine can be built which will, at altitudes, give more power per total weight than the rotary, this type of aeroplane should be eliminated.)
  - (E) Single-seater pursuit—should mount an engine which will give about 150 H.P. at 20,000 ft. altitude.
  - (F) Day bomber—should mount one engine which will give about 325 H.P. at 15,000 feet.
  - (G) Night bomber—should mount two or three of the engines mentioned under (F).

In order to minimize the number of types of engines, it might be desirable to use the same engine in the Army Observation and in the single-seater pursuit. Such an engine should give about 130 H.P. at 15,000 feet.

##### Recommendations of Captain (afterwards Lt.-Colonel) Clark

Captain Clark, who had a larger experience in aeronautics prior to our entry into the war than any other member of the

Commission, was the expert largely relied upon to make suggestions as to the planes which should be manufactured. He visited numerous factories in England, France and Italy and also observed the types of planes in operation at the front. He testifies that his final recommendations on his return to this country in early September, 1917, after learning the situation with respect to engine production here, were for the production of the following types of planes:

Day bomber DeH-9 with the Liberty direct drive, 12 cylinder high compression engine.

Army observation Bristol fighter with the same engine.

Night bomber, a Caproni triplane with 3 Liberty low compression geared engines (Handley-Page an acceptable substitute).

Two-seater fighter, a Bristol fighter with the Liberty 8-cylinder, or with that number of cylinders which should be developed.

Single-seater pursuit,—the Spad, with the Hispano-Suiza.

Single-seater combat with a rotary engine, 150 H.P. Gnome.

Advanced training machine, Bristol Scout, with 85 H.P. Le Rhone.

## PROGRAM AS ADOPTED

### Elementary Training planes

There were selected for production to be used as elementary training planes the Curtiss type known as the JN4-D, with the OX-5 engine, and the Standard type known as SJ-1, with the Hall-Scott or A-7a engine. The program called for 4800 JN4-Ds (later reduced to 3700, and this number was somewhat increased after May, 1918); for 1600 SJ-1s; for 7950 OX-5 engines and 2750 Hall-Scott or A-7a engines (reduced to 2250).

### Advanced Training planes

For advanced training, it appears that there were originally chosen the Bristol Scout with the Le Rhone 80-hp. engine, the Thomas Morse S-4 with Gnome 100 hp., and the U. S. Training with the Hispano (150 hp.). There were modifications which resulted in the adoption of the types known as S4-B (with Gnome 100 hp.), the S4-C (with Le Rhone 80 hp.), the JN4-H and JN6-H (with the Hispano 150 hp.), and the Penguin (with the Lawrence 28 hp.).

### Service or Combat and Bombing Planes

The types first selected for production were the Spad (single-seater pursuit), with the 200 hp. Hispano Suiza engine; the Spad, using the U. S.-8 engine; the Spad Mono-coque, using 150 hp. Gnome engine; the Martinsyde; the DeH-9, the Caproni and the Handley-Page, with the Liberty engine (U. S.-12). Subsequently the Martinsyde and the Spads were rejected, the production of the DeH-9 was first limited and then postponed, the Caproni and the Handley-page were not treated as a part of the immediate program, and the plans for production were centered on the DeH-4 and the Bristol Fighter with the 12-cylinder Liberty engine (U. S.-12).

The program charts which were prepared show extraordinary variations with respect to quantities and surprising expectations as to deliveries. Thus the program for DeH-4s shows a total program on Aug. 2, 1917, of 8000; Aug. 16, of 7500; Aug. 22, of 5000; Aug. 24, of 6000; Aug. 25, of 15,000; Aug. 31, of 6000; Sept. 4, of 15,000; Oct. 17, of 250; Oct. 29, of 1000, at which number it appears to have been continued until Jan. 18, 1918, from which time it was increased until 4500 appear in the program of Feb. 11, 1918, and 8000 in that of Feb. 19 and thereafter.

According to this program or schedule it seems to have been anticipated on Aug. 2, 1917, that 25 DeH-4s would be delivered in October, 100 in November, 425 in December, 750 in January and 1000 in February, and more in each of the succeeding months. Even as late as Sept. 4, 1917, the schedule shows expected deliveries of 62 in October, 1917; 250 in November, 1063 in December; and in the program of Nov. 5 50 were scheduled for delivery in December, 100 for January, etc.

The program of Sept. 5, 1917, for the DeH-9s calls for 2000 of this type; that of Oct. 9, for 4000; Oct. 17, 6750; Oct. 25, 7750; Oct. 29, 7000, at which it continued until Jan. 18, 1918, when it became 7500, to be reduced on Feb. 1 to 5400; and on Feb. 12 the DeH-9 schedule was cancelled.

On Sept. 5, 1917, according to this schedule, deliveries of DeH-9s were expected as follows: November, 1917, 50; December, 200; January, 250, and 300 in February, March, April, May and June. On Nov. 5, 1917, 50 seem to have been expected in January and 300 in February, 1050 in March, 1500 in April, 1900 in May and 2200 in June. As late as Jan. 18, 1918, 40 are scheduled for March and 500 for April.

The program for the Bristol Fighters started on Aug. 2, 1917, with 1000. It appears to have been raised to 3000 on Aug. 16, 1917, within one week it was dropped again to 1000, and on Nov. 26 the program was finally raised to 2000. It seems that on Aug. 2, 1917, deliveries of 25 were scheduled

for October, 50 for November, 100 for December, 125 for January, etc. On Nov. 5, 1917, the schedule calls for 50 in January, 150 in February, 200 in March, etc.

On Aug. 9, 1917, the Caproni program called for 500; on Aug. 16, for 9000; on Aug. 22, for 2000; on Aug. 24, for 500, and there were other variations until the program appears to have settled down after Sept. 28, 1917, to 1000. On Feb. 19, 1918, the program dropped to 50; it called for 250 on May 3, 1918, and was afterwards increased to 1000.

On August 9, 1917, when the program for Capronis called for 500, monthly deliveries of 100 were scheduled to begin in February, 1918. A week later, on August 16, 1917, when the program was increased to 9000, deliveries of 900 were scheduled for December, 1350 for January and each month thereafter. When the schedule was dropped to 1000, deliveries appear to have been expected of 100 in February; and in February deliveries of 100 seem to have been looked for in May.

The Handley-Page program shows on September 5, 1917, a total of 1500, with anticipated deliveries of 100 in December, 300 in January, 400 in February, etc. As late as January 8, 1918, deliveries were scheduled for February of 110, 190 for March, 200 for April, etc. On March 18, 1918, the program had dropped to a total of 50.

These programs, with their variations and schedules of deliveries, appear to be grotesque in the light of the actual facts, but they bear the *imprimatur* of the Planning Department of the Equipment Division with the countersign (except in the case of the De-H-9s) of official approval.

### Suspension of the Program for Single-Seater Pursuit Planes

On October 5, 1917, in reporting the failure of the Spad Mono-coque, the cablegram from our representatives overseas also contained the following advice as to single-seater pursuit planes with rotary engines:

Recommend you build no rotary engine single-seater pursuit airplanes to be sent to Europe existing machines this type will be out-classed by changing time yours arrive build only what you need for use in United States training purposes.

This, however, did not touch the Spad intended to be used with the fixed engine, that is, with the Hispano Suiza engine. That machine was not experimental. As early as July 15, 1917, there was official advice that "200 H.P. Hispano Suiza (is) now fighting on front in Spad aeroplanes." Colonel Bolling reported in his cablegram of August 1, 1917, that the Spad with that engine is "the best fixed engine fighter now in service." There is no reason why this fighting plane should not have been produced here in quantity many months ago. The failure to do so was not due to lack of facilities, but simply to a change of opinion at a critical time as to what was advisable.

Responding to repeated and urgent recommendations for production of Spads in this country, an order for 3000 Spads was placed with the Curtiss Aeroplane and Motor Corporation under date of September 19, 1917. But this order had barely been placed when doubt was cast upon the enterprise, and after preparation for production was well under way the order was cancelled on November 7, 1917.

This is the date of the cancellation, as testified by Mr. Morgan, then vice-president of the Curtiss Company. It was nearly six months later that the production of a single-seater pursuit plane (the S. E. 5) was undertaken, and thus there was a serious loss of time through a reversal of judgment which was in turn reversed.

It should be noted that virtually all the cables of advice sent by our military representatives abroad are signed "Pershing," but doubtless they most frequently come from subordinate officers, and with respect to the subject under consideration, from those in charge of the Air Service overseas. In a cablegram received here on October 5, 1917, the following appears:

If USA 8 cylinder heavier than Hispano Suiza pounds per horsepower build no monoplane pursuit airplanes with USA 8 cylinder engines. Machine will be useless by time it arrives here. Increase number DH 4s or DH 9s by number monoplane pursuit airplanes. This is necessary provided USA 12 is success. Useful loads increasing so rapidly here that engines now in United States are not considered powerful enough meet requirements. Two-place pursuit airplanes considered most urgently needed airplanes next year.

The view thus set forth found support in influential quarters here. On October 27, 1917, Lieut.-Col. Clark in a memorandum sent to Mr. Coffin expressed the opinion that "all fighting and bombing by day will be done in two-seaters flying in regular formation." And he added, "The single seater will be eliminated." A few days later the following cablegram was received:

Nov. 8, 1917. No. 252 (S. D. 2709) Par. 1.

Your 359, paragraph 7, and other cables concerning American engine program. Situation here has changed much during three

months since original recommendations and continues changing constantly. Following general principles appear clear to us. First. Single seater fighter will probably become obsolete general use next year, although small numbers will always be used special purposes. Recommend you produce number already actually under contract and started. Believe we can obtain here all this type required future above number actually under contract here and America. This applies both single seater fighter airplanes and engines. Second. Two seater fighter airplane with stationary engine will supersede single seater. 400 horsepower probably sufficient next six months, after that five hundred horsepower necessary. This summarizes cables already sent you.

It will be observed that while this message recommended against further production, it distinctly stated that the number, already under contract and started, should be produced. But this was not done.

On November 30, 1917, Colonel Deeds cabled:

Curtiss company have completed drawings and ordered material for Spad for 220 H.P. geared Hispanos. We have cancelled that order. Tulasne suggests possibility of helping the French program by building Spad planes here to be equipped with 220 H.P. geared Hispano engines built in France. We could get production in February without materially affecting output of two-place fighters. We are not urging this because of the fact that we have ordered material which can be utilized in other machines, but if it would help your program here is a quick source for these machines.

To this there was a reply (from London) on December 14, 1917, as follows:

With reference to paragraph 1 your cablegram 461 do not recommend unionized production Spad airplanes for France. No such request received from French here. Believe they can produce all these airplanes they need. Think our only efforts should be applied airplanes and engines already on our program. United States should leave production single place fighter to Europe.

The Spad contract having been cancelled and preparations for the production of single seaters in this country abandoned, in less than two months there was an urgent request from our military representatives abroad that Spads be produced here. As early as February 10, 1918, it was recommended that steps be taken to "put into production 1000 Spads one-place with 220 H.P. Hispano Suiza engines for earliest possible delivery in France."

It was said that "French delivery of one-place Spads very uncertain and can not be depended upon. Should have more definite information next two weeks as to whether your production Spad one-place fighter should be further increased." While this new proposal was evidently the result of the breakdown in the French deliveries, it seems that a closer inquiry into the progress of our deliveries of raw material abroad and the conditions of French manufacture would have revealed the serious importance of continuing the production of single seaters in this country in accordance with the original program.

However, the authorities here were not then ready to follow the new recommendation, and two weeks later, on February 25, 1918, they cabled the following reply:

Production of Spads with 220 H.P. Hispano Suiza engines does not fit well into our program because engines cannot be put in production without material delay. Probably first deliveries in France in December. We could somewhat more easily produce the 300 H.P. Hispano Suiza engine. We are now producing large number of 150 H.P. engines for training planes, and could even increase production. We believe with this information you will probably decide not to request production of Spads here. Please give us your full advice.

It was not until March 9, 1918, that this cablegram was answered, with the statement that "question being considered. Will advise you soon." On April 6, 1918, Mr. Potter cabled that the British Air Board had advised that they could supply at once two hundred SE-5 planes without engines. He added, "We can arrange production for 180 H.P. Hispano Suiza engines for same at rate of five per day within 30 to 60 days. Shall we arrange engine supply. If so, will you arrange contract for planes." On the same day Colonel Deeds cabled:

We could within four weeks begin to supply 180 H.P. high compression direct drive Hispano Suiza engines to be shipped to England, to be installed in the planes by the plane manufacturer. Would this type of fighting machine be of value to you, and if so shall we proceed to provide them for you? We are advised that this type is in successful use by the British on the front.

On April 19, 1918, the following urgent message was received from our representatives abroad:

The United States should make immediate preparations for the production of single seater machines to supplement those we may receive from France and England.

But on April 21, 1918, there was a further cablegram (referring to Mr. Potter's cable of April 6, 1918) stating that the whole subject was still under consideration. This message was (in part) as follows:

Will the production of 180 H.P. Hispano Suiza engines be interfered with by contracts placed by French or English. If not, we strongly recommend production of this motor for our needs this year on following basis. (Giving delivery dates.) The situation with reference to single seater fighters for remainder of

1918 is as follows: Both France and England have a plane production in excess of their engine production and as the 180 H.P. Hispano Suiza is already in production in the United States in small quantity, our only practical means of securing the necessary number of single seater fighters will be for the production of this engine for overseas duty to be increased so as to provide the number indicated and for us to distribute these engines here month by month as conditions require. The entire question of the provision of single seater aeroplanes for 1918 and 1919 is being thoroughly investigated and a comprehensive report with all data necessary will be forwarded by an officer familiar with the entire situation.

On April 24, 1918, Mr. Potter cabled that contract could be made with the British Government for SE-5s at the rate of 30 per week beginning July 1st; that 180 H.P. high compression Hispano-Suiza motors could be supplied from here for those planes at the same rate, and that the same machine could be put into production here and shipments begun in September. He asked quick advice if arrangements were desired which would permit of "quickest possible delivery of single seater fighting planes on the front," and he added "SE-5 equipped with 180 Hispano is the only machine we can produce quickly."

To this an answer was received on May 4, 1918, disapproving the production of SE-5s, as follows:

Production of SE-5 for 180 Hispano in America disapproved since it appears that necessary planes for this engine can be obtained in Europe either SE-5, Spad or both.

This was followed on May 12, 1918, however, by a cablegram stating that the question was still open pending final report of Board of Air Service officers, and that final recommendation would be cabled in about ten days.

On May 15, 1918, Mr. Potter cabled referring to the message from overseas of April 19, 1918, urging immediate preparation for production of single-seater fighters and calling attention to the fact that the cablegram of May 4, 1918, was an exact reversal of the former recommendation. He said:

We took immediate action on this recommendation and have given orders for 1,000 SE-5s. Your 1052, par. 2-A exactly reverses these recommendations. In view of this inconsistent information and also due to requests for production of SE-5 from Air Division for training purposes, we have decided not to change our orders for production on these machines, and request that samples be sent promptly in accordance with our London 81, par. 3.

The final result is that there has been no renewed order for the production of spads, and that the order for SE-5s is being proceeded with, but that the American machine of this type is still in an experimental stage. It is understood that the machines are being tested, and that the questions which have arisen and have been brought to the attention of the authorities are receiving their consideration. We have not as yet sent from this country to the battle front a single pursuit or combat plane, as distinguished from the heavy observation or bombing planes, and after giving due weight to all explanations the fact remains that such pursuit planes could have been produced in large quantities many months ago had there been prompt decision and consistent purpose.

#### Delayed Program for the Handley-Page and Caproni Bombing Planes

Although the Handley-Page and Caproni planes remained in the program, production was delayed. Both these types of bombing planes were included in the modified recommendations of the Joint Army and Navy Technical Board on Nov. 21, 1917, and these recommendations were approved by the Secretary of War and the Secretary of the Navy.

#### Handley-Page Planes

On Jan. 25, 1918, a resolution recommending a contract for Handley-Page planes with the Standard Aero Corporation was tabled by the Aircraft Board, in view of the fact that such an order might interfere with work already undertaken by the company. On Feb. 8 the board discussed the advisability of concentrating upon the manufacture of a single type of night bomber, and it was stated that, due to the lack of history as to the comparative performance of the Handley-Page and Caproni, the decision had been made to put both types into production in the United States.

Arrangements had been made for the assembly in England of Handley-Page machines for the American service, and on Feb. 19 the minutes of the Aircraft Board show that a cable had been received on Feb. 14 by the British War Mission indicating that it would be serious to cancel these arrangements.

The minutes add that in view of "a cable received Feb. 18 from General Foulis recommending the building of both the Handley-Page and Caproni types, because of the military needs for the immediate future, it was decided that at present both types should be constructed," and the secretary was asked to keep before the board's attention the necessity

of making a decision prior to July 1 concerning the concentration on the manufacture of one of these types for the year 1919.

On March 19 the Aircraft Board recommended that a contract be placed with the Standard Aircraft Corporation for the assembling of 500 Handley-Page planes and the furnishing of such parts (other than wood parts) as the Government might require, these planes to be assembled and taken down and disassembled and packed for export shipment to such extent as the Engineering Department should require, but not more than 10 per cent of these, that is, 50 planes, to be fully assembled for testing and flying in this country. Orders for 1000 sets of wood parts and for various metal parts of the Handley-Page were placed. In a letter to Colonel Bloomfield, Air Division, under date of March 20, 1918, M. W. Kellogg, Director of Production, thus summarizes what had been done up to that time:

2. Some time ago miscellaneous orders were placed from time to time, either by letter or word of mouth with people that our Production Department felt could facilitate this matter by having manufacturers start on the work. These manufacturers, as per list attached, have done more or less work. The ones that are further advanced are the W. R. Mullins Company of Salem, Ohio, who are supplying approximately 75 per cent. of the metal parts to be used, also the Grand Rapids Airplane Company of Grand Rapids, Michigan of the wood parts, they having at this time received about 250,000 feet of spruce and I understand that a large part of this has been in the kilns and they will start work in a short time which, we would judge to be approximately from a week to ten days manufacturing some of the parts. The other manufacturers are in a more indefinite condition. We are now trying to adjust the questions between them and the Signal Corps by giving them a formal contract, and at the same time ascertaining as far as possible the exact conditions of their detail part of the work. Some of these sub-contractors have very small items. As an example, the two tire companies have only been instructed to develop and make the molds for the tires and have manufactured a very few tires each. Other companies have only made dies for a very small percentage of the stampings, etc., etc.

3. We gave a contract a week ago for the assembling of the machines that are going to be assembled, to-wit: fifty, and for the marking, listing, packing, etc., for export abroad for four hundred and fifty, to the Standard Aircraft Corporation who, in connection with our engineers, will use their best efforts to push the work.

4. We are just starting at this time to line up our Production Department on an aggressive assembling of this material and a correlation of same with a view that if it develops that any of the manufacturers are in such a position that they would seriously delay the work, to put pressure upon them to try to overcome such a condition.

5. We are advising you of all these facts to as clearly as possible give you a picture of the situation so that you can use your own judgment and do as he sees fit in this connection.

6. You will note that while he has ordered numerous parts for 1,000 planes, our assembling contract only covers 500. This was done with the distinct understanding that if the contractors did their work efficiently and well and in proper time, we would favor them with a further order of not less than 500 more machines.

The first Handley-Page plane assembled in this country was flown in the early part of July.

The Standard Aircraft Corporation, it appears, was able to produce the first Handley-Page machine within ninety days from the time they were given full authority for that purpose, and the testimony is that, making allowance for whatever advantage existed by reason of the fact that previous contracts had been let for certain parts the first machine could have been produced at the outset within one hundred and twenty days. Further time, of course, would have been required for quantity production, but for the long postponement of the program of the Handley-Page no satisfactory reason is shown.

#### Caproni Planes

In the minutes of the Aircraft Board, under date of Feb. 12, 1918, it was recited that the Italian manufacturer Caproni had sent to this country samples of his triplane and biplane, with his production engineer, Captain D'Annunzio, expert fliers, and thirteen factory experts, to assist the United States in placing Capronis into production.

On Feb. 7 the board had recommended that a contract be made with the Standard Aircraft Corporation for the manufacture of fifty Caproni planes. Mr. Coffin urged on Feb. 20 that plans be laid for quantity production of Capronis to be assembled in Italy, but it was the feeling of the board that the matter should be held in abeyance until the production of sets of Caproni parts for the Italian Government were under way.

On April 11, 1918, it appears to have been the sense of the Aircraft Board that the Caproni should be put into immediate production, in view of (1) repeated cable advices to that effect, (2) the actual experience in Europe with the Caproni, (3) the fact that Captain D'Annunzio had assured the Signal Corps that there would be no difficulty in the installation of the Liberty motor. On March 21, 1918, Mr. Potter advised the board that the Italian Government did not desire a contract for the manufacture of Caproni parts in this country because of the remoteness of contemplated

deliveries, and inquired the disposition of the board as to the manufacture of 50 complete Capronis, as recommended on Feb. 7. On March 26, 1918, the question of manufacturing the Caproni was again raised in the board, and after discussion was referred to the Chief Signal Officer for the consideration of Colonel Waldon, with especial reference to the question of the establishment of an assembly plant in France.

On April 2 a letter addressed by the Italian ambassador to the Chief Signal officer was referred to the board, inquiring whether the American Government intended to build Caproni planes for its own use, and if so, how many. Discussion was had of the question, "in view of cables recently received urging such production and the expense already incurred by the Government in preparation therefor."

On April 23 Mr. Potter stated to the board that a verbal order has been given to the Fisher Body Corporation for 250 Caproni planes, and that preparations for production were under way. On May 9 it was further stated by Mr. Potter that arrangements had been made with the Fisher Body Corp. and Captain D'Annunzio for the manufacture of 500 sets of Caproni parts by that company, contract for which would be let as soon as funds were available, and that preparation for production was under way, which, however, was not promised before September. Contracts were made in June, 1918, by the Fisher Body Corp. and the Curtiss Aeroplane and Motor Corp., each for 500 Capronis. There were arrangements several months ago, apparently of a tentative character, with the Standard Aircraft Corp. for four Capronis, of which one has been built.

There appears to be no adequate reason for this long delay in putting the Caproni planes into production. If it was due to congestion in plants selected for production this could have been obviated by a better and wider distribution of work. This is, of course, so far as the matter of plane production is concerned. The immaturity of the Liberty motor doubtless had its effect, but it would seem that orders for the motors sufficient to meet all appropriate demands should have been distributed in such a way that there could have been no occasion for delay in the building of planes because of the lack of orders for the engines to go with them.

#### Postponement of the DeHaviland 9

In his recommendation, on his return from Europe in September, 1917, the DeHaviland 9 was preferred by Captain Clark, as the DeH-4 appeared to him to be obsolescent at the time the Bolling Commission was in England and the DeH-9 was designed along the same general lines as the DeH-4, but with its weaknesses, from a military standpoint, corrected.

In other words, he regarded the DeH-9 as far better suited for bombing than the DeH-4. The principal distinction is that on the DeH-9 the rear man—the gun fighter—is moved back about twenty inches from his position on the DeH-4; the pilot is moved back so that he is placed immediately in front of the gun fighter; the fuel is moved forward so that it is near the engine, and between the fuel tank and the pilot is a bomb compartment.

The contracts with the Dayton Wright Airplane Co., the Fisher Body Co. and the Standard Aircraft Corp., originally called for DeH-9s. When, on Sept. 22, 1917, the program, as it then stood, was submitted to Colonel Bolling on behalf of the Chief Signal Officer, it called for 2000 DeH-9s, and the reply was that the number was not sufficient and should be doubled.

It may also be noted that in the same cablegram (Sept. 22nd) from the office of the Chief Signal Officer it was stated that the first deliveries of the DeH-9 with the Liberty 12, and synchronized Marlin piston type airplane gun, would be made in November, 1917.

The sample machine, however, which was first received from England was the DeH-4. The DeH-9 had not yet been put into service at the front. Apparently there was no sample DeH-9 available here until at the end of February, 1918, and it seems to have been thought that progress had been made to such a degree in the developing of the design of the DeH-4 for production that it was advisable to concentrate upon the production of the DeH-4 to the virtual exclusion of the DeH-9.

Consequently, in the substitution of contracts, the DeH-4 took the place of the DeH-9 and it appears that in February, 1918, directions were received from Colonel Deeds and Colonel Montgomery that orders for DeH-9s were to be cancelled for the present, pending information from abroad.

It seems that with an adequate production program this improved type, or its American equivalent, could have been produced here some time ago, but it has not yet been put into quantity production. It is said, however, that the DeH-9 is

now "being put out of production abroad" because of the "coming in" of the DeH-9A which is a further improvement.

#### Result

For obvious reasons, it is not deemed advisable to make public the details of the present aircraft program. That can be stated by the military authorities whenever they think it wise to do so. For the present purpose it may be said that the abandonment of the program for the Spads left us, until recently, without any program for single-seater pursuit planes, and that also, until recently, so far as service planes were concerned, there remained a program for immediate production which was virtually limited to DeHaviland 4s and Bristol Fighters.

The Bristol Fighter as redesigned to take the Liberty motor proved to be a failure and after a series of fatal accidents was discarded. The Bristol was so far removed from a machine that could carry an engine of that power that it has been admitted by high authority that it as "a very foolish thing to put the two together."

Thus, nothing is left of last fall's program for service planes save the DeHaviland 4s. The course of production of these planes is hereafter stated. It appears that after the remedying of various defects they are being successfully used as observation and bombing planes. There are certain limitations, which it is not necessary to describe, of their military effectiveness for this purpose, and machines of the later and improved types are to be provided. By reason of a lack of manouverability the DeHaviland 4 cannot serve the purpose of a pursuit plane.

#### Engines for service airplanes

The Bolling commission's recommendations for the production of engines in the United States for service airplanes embraced the 200-hp. Hispano-Suiza for fixed engine single-seater fighters, the 150 Gnome for rotary-engine fighters, and the Rolls-Royce for United States production only under some special arrangement for a Rolls-Royce factory in the United States.

It was said that the Rolls-Royce engine was "not considered suitable for great quantity production. It also requires very skillful mechanics to keep it in commission at the front." It was added that the Renault, Fiat, Isotta-Fraschini and S. P. A. were too heavy per horse power to be recommended for great quantity production in the United States and that the first three mentioned had new designs under test which might prove very desirable. Special attention was directed to the development of the Bugatti engine. And this statement of the Bolling commission concluded with the observation that the developments in connection with the United States (Liberty) engine now under test "are probably the most important consideration in this question of engine production in the United States."

#### Rolls-Royce and Sunbeam Engines—British Experience

There has been considerable testimony as to the feasibility of securing, in the year 1917, the early production of certain foreign engines, notably the Sunbeam and the Rolls-Royce. In order that there might be an authoritative statement of British experience, there was obtained, through the courtesy of the British ambassador, a memorandum under date of June 22, 1918, which has the authority of the British Air Ministry.

From this it appears that when we entered the war in April, 1917, the British had in use the following airplane engines: 160-hp. Beardmore; 150-hp. RAF4-A; 180-hp. LeRhône; 130-hp. Clerget; 190-hp. Rolls-Royce; 150-hp. Hispano-Suiza; 275-hp. Rolls-Royce; 320-hp. Cossack Sunbeam; 230-hp. RAF3-A. The following engines at that time (April, 1917) were "coming on": 150-hp. BR-1; 180-hp. Viper Hispano; 220-hp. Geared Hispano; 200-hp. Arab Sunbeam; 220-hp. B. R. 2; 270-hp. Falcon, Rolls-Royce; 140-hp. Clerget; 375-hp. Eagle Rolls-Royce; 260-hp. Maori Sunbeam. With respect to these engines, the memorandum furnished by the British ambassador contains the following statement:

Of those "in use" in April, 1917, all were good reliable engines, but it was obvious that they could not remain in the front rank for very much longer.

Of those "coming on" the two Rolls-Royce engines and the 180 Viper Hispano were practically certain to be a success.

The others were undeveloped and could not have been recommended at that time; so that in April, 1917, no Sunbeam engine could have been recommended for manufacture in America, and the general opinion in England was that the Rolls-Royce was quite unsuited to American methods of production.

A further communication from the British ambassador states that what is quoted above on the Rolls-Royce and Sunbeam may be taken to apply equally to July and August, 1917. It should be added that in 1917 Colonel Bolling cabled advis-

ing against the production of the Sunbeam engine in the United States.

#### The Hispano-Suiza Engine

A different situation existed with respect to the Hispano-Suiza engine, which had been used extensively abroad. In the summer of 1917 the 150 hp. Hispano-Suiza engine was in production at the plant of the Wright-Martin Aircraft Corp. at New Brunswick, N. J. That company had received an order from the French government in February, 1916, for 450 of these motors. Although the contract was to be fully performed by the late summer of 1916, there was serious delay and deliveries did not begin until March, 1917.

This delay was due in large part to the difficulty of putting into production an article of very fine workmanship and material which was entirely new to American shop practice. The greatest problem in this sort of work has been the procurement of materials of proper refinement and texture.

The delay was also apparently due in considerable measure to conditions which could have been remedied, and a comparatively small force was engaged on the Hispano-Suiza motor work during the year 1916, the main effort of the company at that time being motor car production. (Since the fall of 1917 virtually all the facilities at the New Brunswick plant of the Wright-Martin Corp. have been engaged in the manufacture of airplane engines.)

By Sept. 1, 1917, 202 engines had been delivered under the French contract and by October, 1917, the difficulties had been surmounted; in that month 117 were produced and the French contract was completed in November, 1917.

The Signal Corps placed a number of contracts with this company, reflecting changing purposes. Under date of July 31, 1917, it placed a contract for 500 of the 150-hp. Hispano (Type A). In September, 1917, a further contract was made for 500 of the same type and this was cancelled on Oct. 2, 1917.

On the latter date the company received a contract for 4000 of the 220-hp. Hispanos (Type F), which were the 150-hp. engines geared to high speed.

This contract was cancelled on Nov. 13, 1917, and was replaced by the contract of that date for 1000, 150-hp. Hispanos (Type A). On Nov. 20, 1917, the company received a contract for 3000, 300-hp. Hispanos (Type H) which was modified by two contracts in the present year postponing the delivery dates, the second of which (May 11, 1918) provided for the manufacture of the 300-hp. Hispanos in Long Island City and for a further postponement of deliveries.

On Feb. 2, 1918, another contract was awarded to the company for 1000, 150-hp. Hispanos (Type A). On Feb. 25, 1918, a contract was made for 1000 Type E or I Hispanos; and on May 25, 1918, another contract for 1000 Type E or I Hispanos was placed with the same company.

Type E is Type A modified as to connecting rod construction, magneto drive construction, and the piston design so as to make possible the carrying of a higher compression and thereby greater power, that is, 180-hp. at normal speed. Type I is 150-hp. and has all the improvements of Type E, except the big compression.

The 300-hp. Hispano (Type H) was in an experimental stage last November and the first deliveries now due of Type H are in October. Under the contract of July 31, 1917, for 500 150-hp. Hispanos deliveries were to begin ninety days from date of contract and determination of final details.

Subsequently, Oct. 25, 1917, was fixed as the date from which the ninety days were to be reckoned and the deliveries were actually completed in February. Under the contract of Nov. 13, 1917, for 1000 150-hp. Hispanos, deliveries were to be completed in April, 1918, and with the exception of one motor they were completed in May, 1918. Under the contract of Feb. 2, 1918, for 1000 150-hp. (Type A) motors, deliveries were to be completed in July and, by the end of July, 988 had been delivered.

The Type A or the 150-hp. Hispano, has been used for the advanced training plane known as the JN-4H. The 180-hp. Hispano is adapted to single-seater pursuit planes such as the Spad or the SE-5 and is now in course of delivery.

On July 25, 1917, the Wright-Martin Aircraft Corp. submitted to the Aircraft Production Board a schedule for proposed deliveries of the Hispano-Suiza motor "of either direct driven or geared specifications" amounting to approximately 7000 over and above the deliveries then due on the French contract.

The offer was on the condition that "orders are placed with us or some definite arrangement made for same at once, so that we have sufficient assurance to warrant us in making the necessary capital expenditures and providing further that arrangements can be made for the Government to furnish us

with the necessary working capital in excess of our present resources."

There is ample basis for the conclusion that had there been a sustained effort to produce single-seater pursuit planes, and with this definite purpose adequate orders had promptly been given so as to justify the provision of additional facilities by this company and the speedy utilization of its highest capacity, engines for these pursuit planes could have been delivered in quantity through the winter and spring and large numbers of these engines would have been available by July 1, 1918, in addition to the production needed for advanced training planes and without interfering with the development of the high-power Liberty motor. This is aside from what could have been accomplished through timely arrangements made for production by other companies.

#### Rotary Engines

In the cable of Oct. 5, 1917, in General Pershing's name, it was recommended that "no rotary engine single-seater pursuit aeroplane" should be built here to be sent to Europe. On Nov. 8, 1917, Brigadier-General Saltzman, Acting Chief Signal Officer, requested the opinion of the Joint Army and Navy Technical Board as to the extent to which rotary motors should be included in the building program for airplanes and engines in the future.

In response, the Joint Army and Navy Technical Board replied that as "the tendency in the design of fighting airplanes" appeared to point toward two-seater fighters of maximum power, it was believed that in the general building program for the coming year "rotary engines should be considered of secondary importance."

It was added, however, that in order "to anticipate improvements in the art or changes in the military situation" it was desirable that the art of building rotary engines be retained in the United States, and that for this purpose "the organization skilled in rotary engine production be preserved."

Referring to the schedule of production of rotary engines, the board expressed the opinion that the order for 2500 80-hp. LeRhône engines was larger than was necessary to preserve the art and that this order should be reduced to the minimum number that would accomplish the purpose, and it was further recommended that steps be taken to preserve the possibilities of production of the 160-hp. Gnome engine. The immediate occasion of this inquiry was the pending question whether the Government should purchase the plant of the General Vehicle Co. of Long Island City, which was manufacturing Gnome motors.

This purchase was made but the manufacture of Gnome motors was continued at this plant for a time. In May, arrangement was made for the use of the plant by the Wright-Martin Aircraft Corp. in the building of 300-hp. Hispano-Suiza. Additional orders have been placed for LeRhône engines. The rotary engines have been used for advanced training planes.

#### The Liberty Engine

In the latter part of the year 1914 the Packard Motor Car Co. decided to go extensively into the development of air motors. It had received one of the Mercedes motors, used by the Germans in their airplanes, which had been imported in a racing chassis.

Taking certain features from that motor and from other motors, an engine was designed in 1915, a duplicate of which was used in a racing car. This engine developed 140 hp. at 3600 r.p.m. Another model, with greater power, was completed in December, 1916, and was also used in a racing car; this was rated at 200 hp. at 2180 r.p.m. It was described in a pamphlet exhibited at the Aeronautical Show in New York in January, 1917, as "The Packard Aircraft Engine," exhibited as a "stimulant to the new aviation industry."

The work of developing these motors had been under the direction of J. G. Vincent, then vice-president of the Packard Motor Car Co. in charge of engineering. In the latter part of May, 1917, Mr. Vincent took his drawings to Washington for the purpose of laying before the Government the plan of the Packard company to manufacture these engines in large quantities through enlisting the aid of other automobile manufacturers who had experience in high-grade motor work.

Mr. Vincent met Mr. Deeds, Mr. Waldon and others. The design was not deemed to be adequate for the needs on the Western Front and it was necessary to increase the horsepower of the motor with lighter weight per horsepower. Mr. Vincent worked in Washington in conjunction with Mr. E. J. Hall of the Hall-Scott company, making sketches for the purpose of improving the motor, and in a few days a new motor was designed embodying to a considerable extent the engineering features which had been developed during the past two years of experimental work.

The first efforts were directed to the development of an 8-cylinder motor, and in a few days Mr. Vincent returned to Detroit, taking the Washington sketches for the purpose of having a wooden model made by the Packard company, and this was done.

At the request of the authorities, Mr. Vincent was loaned by the Packard company in order that he might take charge of the Engineering Division of the Aviation Section of the Signal Corps. The Packard company made a full-sized operating model, which was sent to the Bureau of Standards on July 3. Later, about August, 1917, the production of an 8-cylinder engine was postponed and the immediate production of a 12-cylinder engine of the same type was decided upon.

In developing the design for the purpose of quantity production various difficulties were encountered. Aside from minor changes found to be necessary in the course of production, the crankshafts, connecting rods and bearings in the first thousand engines were too light, creating a dangerous condition.

The crank shafts, connecting rods and bearings had to be redesigned. It was also found to be advisable to change the system of lubrication and, again, it was difficult to obtain a development of radiators that were suitable for a motor of this size. As late as June 25th of this year, General Pershing's cable described a series of defects in the motors which had been shipped abroad and these, it is understood, were speedily remedied.

It now appears to be conclusively established that the Liberty engine is a great success for observation and bombing planes, and for this purpose it has found high favor with the Allies. It is too heavy for the lighter pursuit planes. The following statement furnished by the British Ambassador with respect to British opinion of the Liberty motor, was received on June 22, 1918:

No bench tests have been applied to the Liberty Engine in England but tests in the air, similar to those applied to British engines, have been carried out on a D.H.9-A with satisfactory results. Bench tests in France were observed by members of the British Technical Department and were satisfactory. The tests carried out in France were the Standard French tests, and do not differ very largely from the Standard English tests, except that the power output was taken with a fan brake instead of a Froude Water Brake, as generally used in England. The results were excellent, except that the design of crankshaft and connecting rod was found to be faulty, but this was well known and had been modified in the United States. The carburetor was also found to be unsatisfactory but is now in course of being remedied.

The official opinion of the Liberty Engine is that it is an engine which, with a natural development in the perfecting of its details, will prove reliable and up to the power and consumption standards that have been claimed. It is eminently suited for bombing and reconnaissance aeroplanes, but not for fighting aeroplanes. The number of engines actually ordered for the British Government is 980, but 4,500 are required by the end of the year. The British Government would have prepared to place an order for 3,000 at once, but, at the desire of the American Government, the order was limited to 980, the number which was allocated for delivery up to the end of June. Up to date, 205 engines have been delivered from the Works.

The following is the text of a telegram received from the Air Ministry on June 8th:

The British technical authorities have reported to the air minister that the liberty engines have now been subject to sufficient air experiment in England to warrant confidence in this engine. Excellent results have so far been obtained which place the engine at once in first line of high powered air engines. Naturally service experiment in the field is still to be obtained but the Liberty engine will be a most valuable contribution to the Allied aviation programme and the United States should develop production with every confidence.

The following further statement was supplied by the British Air Ministry, under date of Sept. 27, 1918:

No severe bench tests on the Liberty Engine were carried out in England, owing to the extensive tests in America.

The only bench test in England was one short test, at nine-tenths power, for data re oil and fuel consumption. The result was quite satisfactory.

One engine was stripped after 100 hours flying and was found to be in good condition.

Tests in the air have been carried out in de Havilland 9-A and de Havilland 10, machines. In these the engines have performed uniformly satisfactorily.

The performance of the Liberty Engine is at least as good as that of the Rolls-Royce in identical machines. The information officially expressed four months ago, that the Liberty Engine would prove satisfactory in service, is wholly confirmed.

The facts as to production will be given later.

#### FIFTH. SELECTION OF CONTRACTORS AND DISTRIBUTION OF WORK

##### Selecting of Contractors

For engines to be used in training planes, there were orders (to June 30, 1918) for 7950 OX-5s distributed among the Curtiss Aeroplane & Motor Corporation, the Willys-Morrow and Willys-Overland companies. Orders for the Hall-Scott engines (2250) were placed with the Nurdyke & Marmon Co.

and the Hall-Scott Motor Co. The General Vehicle Co. received an order for 111 Gnome engines (100 hp.), and the unfilled portion of this order was taken over by the Aeronautical Engine Co., which also received certain additional orders for engines of the same type, when the latter corporation was organized to conduct operations at the plant of the General Vehicle Co. after its purchase by the Government.

The Union Switch & Signal Co. had orders for 2500 Le-Rhone engines (80 hp.). The orders for the Hispano-Suiza engines placed with the Wright-Martin Aircraft Corporation have already been sufficiently detailed (*ante*, p. 96). In addition, orders for 450 of the Lawrence engine (28 hp.) were placed with the Excelsior Motor Manufacturing Co., and an order for 2000 Bugattis was given to the Duesenberg Motor Corporation.

In the summer and fall of 1917 contracts were entered into for the manufacture of 22,500 Liberty motors, as follows:

August 31, 1917, Lincoln Motor Co.....	6,000
September 4, 1917, Packard Motor Car Co.....	6,000
September 7, 1917, Nurdyke & Marmon Co.....	3,000
September 11, 1917, Trego Motor Corp.....	500
November 22, 1917, Ford Motor Co.....	5,000
December 11, 1917, General Motors Corp.....	2,000
Total .....	22,500

The contract with the Trego Motor Corporation was subsequently cancelled,\* only one engine being delivered.

For the production of elementary training planes of the type known as JN4-D, reliance was placed chiefly upon the Curtiss Aeroplane & Motor Corporation, which had already made planes for the British Government. Substantial orders were also given to the Springfield Aircraft Co. and the Canadian Airplane Co., Limited (of Toronto). A number of small orders were placed from time to time with various concerns. The total orders to June 30, 1918, were for 3975 of the JN4-D type.

The orders for the Standard-J training planes were distributed among the Dayton Wright Airplane Co., the Fisher Body Corporation and the Standard corporations (Standard Aero Corporation and Standard Aircraft Corporation). The total orders were for 1600 of this type.

For advanced training planes, there were orders given to the Curtiss Aeroplane & Motor Corporation (to June 30, 1918) for 919 JN4-H and 479 JN6-H; to the Thomas Morse Aircraft Corporation (for 100 S4-B and 400 S4-C), and to the Breese Aircraft Corporation (for 300 Penguins).

With respect to both elementary and advanced training planes there were also various orders for spare parts.

In service planes, the production of the DeHaviland-4s was pivoted upon the work of the Dayton Wright Airplane Co. in connection with the designing of the plane for American production, as hereafter explained. There were contracts for 8500 of the DH-4s as follows:

Dayton Wright Airplane Co.....	4,000
Fisher Body Corp.....	4,000
Standard Aircraft Corp.....	500
Total .....	8,500

The contract for the Bristol fighters (2000) was given to the Curtiss Aeroplane & Motor Corporation.

In view of the exigency, it was inevitable that the responsible officials of the Signal Corps entrusted with the duty of aircraft production should exercise a broad authority, virtually unhampered by restrictions, in the selection of contractors.

The Aircraft Board, in which the responsible Army officers sat as members, afforded a useful opportunity for the comparison of views, but not a legal, and only to a limited extent, a practical, check. There have been numerous complaints from individuals and corporations who sought contracts unsuccessfully. The extent to which activities were centered at Dayton, the profitable contract promptly given to Colonel Deeds' former business associates, and the preference of a small group of manufacturers in the allotment of the large contracts, created a feeling of distrust which finds frequent expression in the record of this inquiry.

There could be no well-founded objection to a well-directed effort to standardize products for production in large quantities under conditions favoring the most economical and efficient work. So far as orders for production of planes in small quantities and various spare parts are concerned, to give an adequate statement of the facts with respect to the companies who received, or which asked and were refused, contracts would require a great variety of detail which it is impracticable to set forth.

It does not appear that in the award of these contracts there was adherence to any clearly defined principle. It is sufficient to say that in many instances the parties complain-

ing have no ground for their complaints, save that others in no better situation obtained what the complainants were denied.

For, while offers or requests of some manufacturers went unheeded because of alleged lack of proper facilities or of assured financial ability, in other cases contracts were made with parties equally destitute of adequate resources. Among those whose facilities were apparently adequate, some were taken and others were left.

But aside from any question of discrimination between manufacturers, it is obvious that the exigency demanded that important and needed sources of supply should not be neglected, and in this connection, without attempting to make a comprehensive statement of other available resources, the case of the Singer Manufacturing Co. deserves special attention.

#### Singer Manufacturing Co.

While this company had no experience in the building of airplanes, it had perhaps the largest plant in the country for cabinet work, and one of the largest veneer plants, and its facilities available for the processes demanded in aircraft production were hardly excelled in the country.

As Colonel Waldon testifies, "There was every reason why they should be successful in airplane manufacture." The officers of the company were not seeking contracts but they offered its facilities to the Government, and these were not utilized. As early as July 14, 1917, Mr. Waldon of the Aircraft Production Board requested an interview with the vice-president of the Singer Sewing Machine Co., and this was had. Later, representatives of the Singer company visited the plants of the Curtiss company, the Dayton Wright company and the Canadian Airplanes, Ltd., of Toronto, and an interview was then had with Mr. Deeds and Mr. Waldon, on August 14.

Up to that time, the manufacture by the Singer company of 3000 training planes had been under consideration, but it was then suggested that it should build 1000 service planes of the DeH-4 type. Before undertaking this work, the representatives of the Singer company desired to examine the sample DeH-4 at the plant of the Dayton Wright Airplane Co. The letter of introduction to that company, however, revealed the fact that the whole proposition was still very indefinite. The letter (Aug. 15, 1917) stated:

We are asking the Singer Sewing Machine Co. to conduct such investigations as is possible while we are making up our minds as to the part of our program they are to fulfill. When they were here yesterday we suggested that they should help in the DH-4 production. This is not definitely settled, and they may be given some other part of the program, but we would like to have them given the privilege of an opportunity to study the details of the DH-4, inasmuch as it represents the latest type of barge war machine from abroad.

On receiving this letter, the vice-president of the Singer Company telegraphed Mr. Waldon that it was so indefinite that the trip would be postponed until it was decided whether it was desired that they should undertake the building of the DeH-4. To this Mr. Waldon replied, under date of Aug. 16, as follows:

We are promptly in receipt of your telegram about the indefiniteness of our letter of August 15th. Since your visit we have received a cablegram which indicates that there will be a very important change in our program, in all probability causing us to change the type of machine you would build. This was the reason I stated in my answer that it was not definitely settled that you would build the DH-4. It will be in your hands, however, whether you go to Dayton and look over the DH-4 as a sample of an up-to-date war machine. The one we have in mind now that we would ask your assistance upon would be quite a little larger than this.

On Aug. 17, Mr. Waldon telegraphed "change in program will probably make it necessary to assign a type other than DH-4." On Aug. 20, the Singer Company informed Mr. Waldon that they had decided to postpone their trip to Dayton "until it is more definitely settled what you wish us to do for you." In a postscript to this letter it was stated that the Singer Company had been requested by the British Government to duplicate their order from that Government for certain airplane parts (universal joints), and they asked whether there was any objection to their undertaking this additional work.

An answer was received on Aug. 23, that this was entirely satisfactory. This additional work for the British Government required the services of perhaps 100 persons, and left the Singer Company quite free to undertake the making of planes for the Government, but no further word was received and no order was given to the Singer Company. In the light of the correspondence, no explanation has been given of the failure to enlist its important resources for the purpose of aircraft production.

#### Engel Aircraft Company, of Niles, Ohio.

In view of the former connection of Mr. Harry E. Baker, the brother of the Secretary of War, with the Engel Aircraft

\*It is understood that it has been taken over by the Ordnance Department, for tanks. It is canceled so far as its relation to aircraft is concerned.

Co., the facts with respect to its organization and its contracts with the Government should be set forth.

The company was organized about August, 1917, under the laws of Ohio. Mr. Harry E. Baker testifies that it was originally intended to have a capital stock of \$3,000,000 (preferred \$1,000,000 and common \$2,000,000), but this was subsequently reduced to \$1,500,000 (preferred \$500,000 and common \$1,000,000). Mr. Harry E. Baker, of Cleveland, was president and general manager. His associates in the organization of the company were Mr. Engel, vice-president and production manager, and Mr. Patterson, secretary and treasurer.

Mr. Baker had taken an option in the spring of 1917 for the plant at Niles, Ohio, formerly owned by the Engel Airplane & Motor Co., and this was taken over by the new company, which, in effect, issued its preferred stock therefor, at a cost of about \$225,000. The remainder of the preferred stock was sold for cash. The preferred stock was entitled to seven per cent cumulative dividends and, as Mr. Baker states, was to be retired at par before the common stock participated in earnings. The common stock was issued to Mr. Baker and his associates for services in promotion. As an officer of the company, Mr. Baker received a salary at the rate of \$7,000 a year.

On Oct. 9, 1917, the Aircraft Board recommended that an order be placed with the Engel Aircraft Co., for spare parts for 100 JN4-D training planes, at the aggregate price of \$80,827.80. At the meeting of the Aircraft Board on Oct. 19, 1917, it was recited that the Equipment Division had recommended that a larger order be placed with the Engel Company, and the Board thereupon rescinded its resolution of Oct. 9, and recommended that an order be placed with the Engel Company for spare parts for 700 JN4-D airplanes at a total cost of \$585,077.50.

Following this contract for 700 sets, Mr. Baker states that there were further orders from the Government during his connection with the company for 200 sets of spares for JN4-Ds, 200 sets of spares for JN4-Hs, and another order of 100 sets of spares for JN4-Ds, the aggregate orders being for 1200 sets of spares at a price of about \$1,000,000. Mr. Baker testifies that he ceased his connection with the Engel Company on Jan. 21, 1918.

The Secretary of War testifies that either before or after our entry into the war his brother (Harry E. Baker) asked him whether there was any reason why he should not go into the manufacture of a certain flying boat for the Navy, in association with one Engel. The Secretary told him that he knew of no reason why he should not.

Later his brother informed the Secretary casually that they were going to make airplanes, and asked if the Secretary objected. The Secretary replied that he had no right to object, but did not wish to be consulted about it; that he had nothing to do with it. Later, the Secretary discovered that the Engel Aircraft Co., of which his brother was president, had a contract with the Government, which was not a competitive contract, but one which had been given upon an inspection of the facilities of the aircraft company.

The Secretary sent for General Squier and asked for the facts. The Secretary regarded the situation as intolerable and directed that the contract should be cancelled. Thereupon it was immediately cancelled by telegraph and arrangements were made, through Mr. Eugene Meyer, Jr., (acting for the Secretary) for the separation of Mr. Harry E. Baker from the company.

The Secretary thought it was just that his brother should be paid on the basis of the value of any services he had rendered, but that his complete separation from the company was necessary before a contract should be regarded as possible.

Mr. Harry E. Baker testifies that, in January last, he was informed by telephone that all of the contracts of the Engel Company had been cancelled; that he immediately went to Washington and had an interview with Assistant Secretary of War Crowell, who told him that his association with the aircraft business was embarrassing to the Secretary of War, and that he should retire from it.

He said that he had no desire to furnish cause for embarrassment, and accordingly, after an interview with Mr. Meyer, he turned back to the treasurer of the company all of the stock that he had in his name and resigned as president and general manager.

Mr. Baker testifies that the company paid him nothing for his stock. In addition to the payments of salary which, according to his testimony, he had received for two months at the rate of \$7000 a year, Mr. Baker says that he was paid on his retirement the sum of \$15,000 in consideration of the services that he had rendered.

Being assured that the separation of his brother from

the company had been effected, the Secretary notified General Squier that the capacity and merits of the company were the only matters to be considered. All the contracts were immediately reinstated on the same terms. Subsequently an additional order was given to the Engel Company for 500 sets of spares for DeHaviland-4s, at an estimated cost of \$2,275,000.

#### Distribution of Work.

Quite as important as the selection of contractors and the development of adequate sources of supply, was the distribution of work so as to insure prompt and efficient production. Each type of plane requires special preparation and the demands of varied sorts of work may easily be mutually restrictive and demoralizing. A conspicuous instance of this is furnished in the case of the Standard Aircraft Corporation.

This company with its predecessor (the Standard Aero Corporation) had the unusual features of being a manufacturing corporation under the direction of two lawyers, Harry Bowers Mingle and Max J. Finklestein, of the firm of Mingle and Finklestein, of New York City. It is unnecessary to review the financial history of the two Standard corporations, with their plants at Elizabeth and Plainfield, New Jersey.

It is sufficient for the present purpose to say that from the time of the organization of the Standard Aircraft Corporation in November, 1917, it has been the operating company, except that recently the Standard Aero Corporation has been availed of, and it has taken the plant at Plainfield for the purpose of handling fixed-price orders, the cost-plus contracts being in course of performance at the large plant at Elizabeth.

Both these corporations are controlled by Mitsui & Company, a leading Japanese firm, which holds all the preferred stock and a majority of the common stock of each company. The orders which have been given by our Government to one or the other of these Standard companies exhibit an extraordinary range of types embracing training planes of the Standard-J type, six machines and spares of the JR-1B type for the Post Office, advanced training planes of the M-Defense type, four Capronis, the assembly of Handley-Page planes, five hundred DeHaviland-4s, as well as flying boats for the Navy and various orders for small parts.

The effect was to put in this plant almost every variety of airplane work, a proceeding which has no justification from a production standpoint. Mr. Charles H. Day, the chief engineer of the standard companies, whose ability is generally recognized, frankly admits the serious disadvantage of this multiplicity of orders. He says:

There is a natural amount of confusion in having a multiplicity of those parts. . . . The engineering personnel is limited by the number of different machines you have to produce, and the executive force is limited by the same amount. The physical layout of the factory itself is very seriously affected. . . . We have on the HS boat job, made entirely our own drawings. It was out of the question to work to the drawings which were supplied us and we therefore redrew the entire job. That occupied a great amount of time of the drafting room and the engineering departments of the Standard Aircraft. Then a great amount of drawing has been necessary on the DeHaviland-4, it being impossible to get VanDyke drawings from the Signal Corps, and we have attempted to draw up a great deal of that machine, and we have redrawn in its entirety the Handley Page machine. That involves the engineering department and the drafting department and the bill of materials department sometimes known as the specification department which is one of the most important we have, inasmuch as under the present regulations we are not allowed to purchase material except we bill the material. The approvals officer will not approve the materials except on the basis of a bill of materials supplied, and making the bills of materials and completing the drawings on all these different machines has been extremely difficult.

Q. Have you had in your drawing department the HS boats for the Navy, that is the seaplane, the Handley Page planes and the DeHaviland planes, all being worked out at the same time? A. Yes, sir.

On the same point, Mr. Day again testified:

The order for the DeHaviland-4s is a very small order comparatively. . . . If we were to turn over our plant entirely into building the 500 DeHaviland-4s and had a go-ahead on 500 DeHaviland-4s, it would not last very long. We expected early in this year and were preparing to take over a large order for Capronis. That was before we had the DeHaviland machines, and it was supposed to be a thousand Capronis. That was a fair sized order, and we expected we would have that alone and nothing else. But that was withdrawn, and the order for 700 sets of spare parts for the Bristol and 1500 sets of spare parts for the DeHaviland-9 was given us, and that was a pretty fair sized order. That in itself would have been sufficient for some length of time, but both of those orders were recalled. The interference, so far as spare parts of machines is concerned, would have been less than the interference caused by two orders for complete machines. It has been impossible for us to obtain a large enough continued order to actually know what we were going to do and to prepare for doing it.

Criticisms upon the management of the corporation do not excuse such a state of affairs. If a manufacturing corporation is to be entrusted with work, it is manifest that it should be given the work it can handle efficiently; and if

its efficiency is distrusted, there is still less reason for embarrassing it with confusing orders.

On the other hand, if it is deemed capable of successful production it should have a suitable opportunity to develop it. The effect of placing such an assortment of orders, coupled with the difficulties besetting production in this new industry, has not only interfered with production, but has promoted waste, made it exceedingly difficult to maintain proper cost accounts, and has confused responsibility for delays.

Other illustrations of a poor distribution of work might easily be given; the result of it is that one part of the Government's program has stood in the way of another.

#### SIXTH. THE COURSE OF PRODUCTION.—DELAYS.— MISLEADING PUBLIC STATEMENTS

It is not deemed to be necessary to review in detail in this report such delays as occurred in the delivery of training planes and engines therefor. As early as Feb. 16, 1918, 1733 had been delivered of the JN4-D and 683 of the SJ-1 elementary training planes. As already stated, 2972 of the JN4-D had been delivered by June 30 and the total order for the SJ-1 (1660) was completed by May 11, 1918. By Feb. 16, 1918, there had been delivered 1438 of the OX-5 engines and 1083 of the A-7a engines and deliveries continued from week to week.

The elementary training planes of the JN-4D type seem to have been satisfactory. In connection with this phase of the execution of the aircraft program it should be said that the general average of accidents in training for all the camps in the United States, is one accident for every 3200 to 3600 hours of actual flying.

The worst school, in this respect, is one accident for every 1900 hours of flying and the best school shows one accident for every 4800 hours of flying. While it is somewhat difficult to obtain comparative statistics with respect to accidents in French and British training camps, it is believed from reports from our officers serving in the English and French schools that we have about twice as much flying per accident as either of the other nations.

The condemnation of the SJ-1 plane as dangerous, because of the Hall-Scott engine, has already been mentioned. It is to be noted that as early as Feb. 12, 1918, the Joint Army and Navy Technical Aircraft Board passed a resolution reciting the opinion of the Board "that the Standard airplane as completed with the Hall-Scott engine is not a satisfactory training machine" and recommending "that if it is necessary to make further purchases from the Standard Company of types that have been developed by them, that such machines be of the type designed for the installation of the Hispano-Suiza engine and the 150 Hispano-Suiza engines be purchased for these machines." The Standard J training plane with the Hall-Scott engine continued to be used until it was condemned in June, 1918, on General Kenly's return from overseas and after his careful examination of its operation. The order of General Kenly, under date of June 6, 1918, is as follows:

1. Due to the shortage of training type airplanes in the past it was necessary to use a certain number of Standard J-1 airplanes for training as filler-in until there were sufficient JN-4 machines manufactured for all schools.

2. At the present time there are sufficient JN-4 machines in storage to entirely replace all Standard machines in use. The Director of Military Aeronautics therefore desires that no more Standard airplanes be used in flying training and that steps be taken at once to entirely replace the Standard J-1 machines now in use by JN-4 airplanes. The Standard machines can be utilized in Mechanics' Training Schools, Ground Schools and any other schools where it is not necessary that they be taken into the air.

With respect to advanced training planes, it may be said that by Feb. 16, 1918, 60 had been received of the S4-B and 105 of the JN4-H. The delivery of Penguins did not begin until the middle of April, and of S4-Cs until May. There had been delivered by Feb. 16, 1918, 121 of the Gnome (100 hp.) and 444 of the Hispano (150 hp.) engines. Deliveries of the Lawrence (28 hp.) began in March and of the LeRhône (80 hp.) in May, 1918.

#### Service Planes

As already stated, the program during the period under consideration and until recently has been practically limited to the DeHaviland 4s and the Bristol Fighters.

#### The DeHavillands

The contracts for these planes, after the substitution of DeH-4s for DeH-9s, called for 8500 DeH-4s, viz.: Dayton Wright Airplane Company, 4000; Fisher Body Corporation, 4000; Standard Aircraft Corporation, 500.

Under the first contract with the Dayton Wright Airplane Company (dated Sept. 7, 1917), deliveries of the DeH-9s then

provided for were to begin in November, and the entire 2000 were to be delivered by the end of June, 1918. Under the modified contract (Jan. 17, 1918), for 1000 DeH-4s and 3000 DeH-9s, deliveries were to begin in January and to be completed by the end of July, 1918.

Under the final contract (April 1, 1918), substituting 4000 DeH-4s, the latter were divided into two lots of 2000 each, the first lot for immediate production to be delivered by Aug. 1, 1918, and the remainder to be delivered as order.

The first DeH-4 was shipped from the plant of the Dayton Wright Airplane Company on Feb. 5, 1918. It was intended for the American Expeditionary Forces in France, but it was not completely equipped; it did not have any bomb gear that would work. On Feb. 14, 1918, the following telegram was addressed by Mr. Talbott to Colonel Deeds:

Wire received reference Secretary Redfield and Dr. Stratton. Major Shepler advises first one hundred DeHavillands to remain in this country. If so, will you recall plane shipped for foreign shipment, allowing us to substitute plane completely equipped. Progress here encouraging.

However, the plane already shipped, was not recalled. The transport containing it sailed on March 22 and, on account of engine trouble in the Azores, it did not reach Europe until May 4.

Nine additional DeH-4s were shipped by the Dayton Wright Airplane Company in February for the use of various fields; two on the 15th, one on the 16th and two on the 17th, intended for Gerstner Field in Louisiana; one on the 21st for McCook Field (which was sent to South Field); one on the 22nd for the Fisher Body Corp.; one on the 23rd for the Standard Aircraft Corp., and one on the 25th for McCook Field. Four were shipped in March; two for Gerstner Field on the 9th and 12th, one for McCook Field on the 10th, and one on the 21st was delivered to the Property Officer at the Dayton Wright Airplane Company.

There were no shipments for the American Expeditionary Forces between Feb. 5th and April 3, 1918, when four were shipped; four more were shipped on April 14th and four on April 22nd, and there were no more shipped for use abroad until May 2, 1918. That is to say, up to May 2nd there had been thirteen DeH-4s shipped for our forces abroad.

It was in May, 1918, that what may properly be called quantity production of DeH-4s began. By the end of that month 193 DeH-4s, and by the end of June, 529 DeH-4s had been delivered by the Dayton Wright Airplane Company. Of these 529, it appears 381 had gone to ports of embarkation, 116 to the Navy and 32 to various destinations in this country, including training fields.

On June 25th, advices were received that there were serious defects in the planes which had been received abroad. At the meeting of the Aircraft Board on July 31st Colonel Arnold stated that all planes shipped to Europe by the Army which were found on arrival to have weaknesses were rebuilt at the aircraft production centers. At the same meeting, Mr. Potter stated that the DeHaviland planes for the Navy which had been shipped from the factory but were not yet floated should be sent back to the Dayton Wright Company to be rebuilt.

From June 30th to Oct. 11th, 1918, the Dayton Wright Airplane Co. delivered 1320 DeH-4s, making 1849 in all to the latter date.

In the contract with the Fisher Body Corporation (Nov. 6, 1917) provision was originally made for 3000 DeH-9s, the deliveries to be completed before July 1, 1918. For these there were subsequently substituted 4000 DeH-4s, of which 2000 were to be delivered by Sept. 1, 1918—afterwards extended to Nov. 1, 1918—and 2000 more at dates to be fixed. Up to June 30, 1918, no deliveries of DeH-4s had been made by the Fisher Body Corporation. This company got into quantity production in August and had delivered 452 up to Oct. 11, 1918.

For the order of 500 DeH-9s placed with the Standard Aircraft Corporation (Jan. 26, 1918) there were eventually substituted 500 DeH-4s by the contract of March 28, 1918. No deliveries had been made up to June 30, 1918, and only 49 had been delivered up to Oct. 11, 1918.

The total deliveries of DeH-4s, to Oct. 11, 1918, amounted to 2350. Of these, 1617 had been floated, 388 were at ports or in transit, 177 had been shipped to camps and training fields, and 168 are described as being for 'manufacturers and miscellaneous.'

#### Bristol Fighters

The contract with the Curtiss Aeroplane and Motor Corporation called for 2000 Bristols to be delivered by Aug. 31, 1918.

There was no definite release for production until February and then only to the extent of 25 machines. 400 were released for production in the latter part of March and 400 more on

April 24th. As already stated, only 27 were delivered in all, and the order was cancelled in July.

### Liberty Engines

The deliveries were to be completed as follows:

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.
Lincoln Motor Co.	5	80	160	275	701	1400	1500	1400					
Packard Motor Car Co.	50	200	500	800	1000	1200	1300	1000					
Nordyke & Macdonald Co.			25	125	550	700	800	800					
Ford Motor Co.						300	800	1000	1000	1000			
General Motors Co.						25	125	250	300	400	500	400	

These were the actual deliveries:\*

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	to Oct.	Total
Lincoln Motor Co.				7	24	134	105	300	454	701	1022	2737	
Packard Motor Car Co.	1	25	43	94	153	314	439	556	794	543	970	3854	
Nordyke & Macdonald Co.							0	16	24		117	157	
Ford Motor Co.								53	197	450	1213	1868	
General Motors Co.								130	244	306	371	1012	9689

The total deliveries of Liberty motors (US-12) to Oct. 11, 1918, amounted to 9689, of which 6895 were for the Army and 2794 for the Navy. Of those for the Army, 3555 had been floated, 456 were at ports or in transit; and there had been delivered 990 to Allied Governments, 260 to flying fields, 1429 to manufacturers, etc., the remainder, or 205, being turned over to the Navy.

Contracts have recently been made for the production of the Liberty 8 (US-8), but no deliveries had been made to Oct. 11, 1918.

### Misleading Public Statements

In the face of the delays in production a series of misleading public statements were made with official authority. While these statements were authorized by the Secretary of War, he states that they were issued in reliance upon information furnished by the Chief Signal Officer, General Squier, and by Colonel Deeds, who were acquainted with the actual conditions. It is unnecessary to review the delusive predictions and exaggerations contained in these utterances.

But particular attention should be directed to the official statement released for publication in the papers of Feb. 21, 1918, which contained the following:

The first American built battle planes are to-day en route to the front in France. This first shipment, though in itself not large marks the final overcoming of many difficulties met in building up this new and intricate industry.

This statement had its origin in a conversation between Colonel Deeds and a representative of the Committee on Public Information a week or two before the completed statement was issued. A draft was first prepared and submitted to Colonel Deeds, who examined it and made some corrections. The statement contained in the paragraph above quoted was not only left unchanged but was the subject of special inquiry.

Colonel Deeds was asked what was meant by the "first shipment," and he replied, "They are on the water now, on the way to France." He was then asked, "How many?" and he answered, "I do not know, but I do not think more than ten." The statement in its final form was then presented to the Secretary of War, who permitted it to be issued upon the understanding that it had been verified by General Squier and Colonel Deeds.

At the time this statement was issued (Feb. 20) only one plane had been delivered for shipment to the American Expeditionary Forces, and while this had been shipped from the factory on Feb. 5, it did not leave the United States until March 22. The only other service planes which had been delivered were five DeH-4s, which had been shipped for use at Gerstner Field, Louisiana. No additional shipments of airplanes for the use of our forces abroad were made until April 3. Actual production in quantity did not really begin until May.

Colonel Deeds admits that this statement was brought to him before its publication, and that he went through it. He examined it minutely enough to correct with his own hand one of the paragraphs following that above quoted, which gave the number of men required on the ground for every plane in the air, his correction making it 46 instead of 45.

Colonel Deeds denies, however, that he said in response to the inquiry upon the point that the battle planes were "on the water now, on the way to France." That he did make this statement is testified to directly and unequivocally by John W. McConaughy and Merlen E. Pew, representing the Committee on Public Information.

When Colonel Deeds was examined as a witness before the Committee on Military Affairs of the Senate, on April 2, 1918, he was asked this question and gave this answer:

\*There are slight discrepancies between the factory records and the Government reports, and the latter apparently based on actual receipts are used in this tabulation.

Senator Wadsworth. Did you see, or do you know whether any other responsible officers in your Aviation Section of the Signal Corps saw the statement given out by Secretary Baker on February 21st before it was published?

Colonel Deeds. No, sir, I did not see it. I do not know of anybody seeing it.

Colonel Deeds admits giving this testimony. He testified that he did not then recall the paper in question.

Colonel Deeds further testifies, in explanation that when the paper was before him, his information was that "four planes were on the cars en route to France," and that it later developed that only one was sent and the others were diverted to Lake Charles, that is, to Gerstner Field, for tests on radiators.

The shipments to Gerstner Field, however, had been made directly from the Dayton Wright Airplane Co. on Feb. 15, 16 and 17, and these planes had not been shipped from the factory for the American Expeditionary Forces. There is evidence, also (*ante*, p. 113), that on Feb. 14 Mr. Talbott had telegraphed to Colonel Deeds that Major Shepler advised that first one hundred DeHavillands should remain in this country and asking on this assumption for the recall of the one plane "shipped for foreign shipment," so that another could be substituted "completely equipped."

There is no question but that this grossly misleading statement was published on the authority of Colonel Deeds and that the Secretary of War relied upon the fact that it had Colonel Deeds' approval in giving it his official sanction. While this conduct of Colonel Deeds does not come within the scope of the Criminal Code, it deserves the prompt attention of the military authorities.

General Squier testifies that he had nothing to do with the statement that was issued for publication on Feb. 21 and that he did not know of it before it was published.

He testifies that when it was brought to his attention he did not regard it as a proper statement to have been sent out, but that he did not institute an inquiry to ascertain who was responsible for it. It is evident that the matter called for immediate investigation and for suitable disciplinary measures, but no steps were taken either for correction or punishment.

The Secretary of War states that the responsibility for the statement clearly rested with General Squier and Colonel Deeds, and that he did not learn of the inaccuracies of the statement until his return from Europe in the latter part of April.

There were earlier statements of a delusive character as to the progress of aircraft production, but the particular statement to which attention has been called was inaccurate in its specific statement of facts, and its misleading character was obvious to anyone having knowledge of the actual conditions.

### SEVENTH: CAUSES OF DELAY IN PRODUCTION.

#### First: Lack of knowledge and experience.

This was a fundamental difficulty affecting production in all its stages. The industry was new, and there was a lack of engineers and skilled workmen. Novel problems were encountered at every step, and lack of knowledge bred indecision and confusion.

Experience in other manufacturing enterprises gave no assurance of facility in this untried field. In addition, it was necessary to develop new sources of supply of needed materials, and the difficulties of the main contractors had their counterparts in the plants of sub-contractors by various sorts of material or fabricated parts were supplied.

#### Second: Defective organization in the Signal Corps.

The duty of providing an adequate organization for aircraft production was left to the Signal Corps. It is quite clear that this undertaking was beyond the competency of the Chief Signal Officer, who had neither training nor experience for such a large industrial enterprise, and those who were brought to the task in his department failed to produce an organization which was adapted to meet the exigency.

The contracts were for production, and presupposed that the manufacturers should have an established design. The contractors agreed to produce the described machines in accordance with drawings and specifications to be furnished by the Government.

In order to secure production of types of planes unknown to our manufacturers it was necessary that the Government should create an engineering department which should settle the design and furnish adequate and accurate drawings and specifications. But this essential condition of achievement was not met.

Undoubtedly the lack of airplane engineers was a serious obstacle. Still, there were a few in the country who had

devoted themselves sedulously for a considerable time to the study of aviation problems, and it does not appear that there was a suitable effort to draw to the Government's service such talent as was available.

Whether or not much assistance could have been obtained in this way is a question which cannot be answered in the absence of an appropriate test. It was, however, entirely obvious that the exigency called for the most efficient organization and that to add to inexperience the lack of a suitable organization and the confusion of a divided responsibility would inevitably lead to serious delays and threaten the entire program.

There was an Engine Design Section established about July 1, 1917 in charge of Mr. Vincent, who had been engineer of the Packard Motor Car Co., but had no experience in the designing of airplanes. And this department did not have anything to do with the designing of airplanes as distinguished from airplane engines.

Captain (afterwards Lt.-Col.) Virinius E. Clark, who had had perhaps as much aeronautical experience as anyone in the Army, had been in charge of airplane designing, but he was absent in Europe with the Aeronautical Commission from June until about the first of September, 1917. On his return he resumed the work of airplane designing, and the Airplane Experimental Department was organized about Oct. 1, 1917, in charge of Lt.-Col. Clark, who was put in command at McCook Field, Dayton.

This organization continued until Feb. 6, 1918. Lt.-Col. Vincent testifies that he had been arguing for an "engineering department" with the idea that it would take entire charge of engineering as it pertained to engines and planes" and "definitely straighten out" what he thought to be "an unsettled condition."

By this he meant that "an attempt was being made to put planes into production in this country without having complete drawings or a complete understanding as to just what equipment such planes were to carry."

But for the purpose of settling designs of airplanes and furnishing drawings to the manufacturers the Airplane Experimental Department proved to be hopelessly inadequate, and the result was that it was largely left to the manufacturers themselves to work out the designs of service planes, an undertaking for which they were ill-equipped.

When the Airplane Experimental Department failed to give satisfaction, instead of strengthening it and making it adequate to the engineering work which had to be done, an additional department was created (about January 1, 1918) which was called the Production Engineering Department.

This Department was also located at Dayton, because the Dayton Wright Airplane Co., was at that place, and there the department remained until the middle of April. It was said to be its function to supply manufacturers with engineering information, drawings, specifications, etc., from which they could produce in quantity what they were to manufacture; to specify materials, to decide upon details of design, etc.

It was not, however, established merely as an aid to the manufacturer in producing according to a settled design, that is to enable the manufacturer to cope with the difficulties which were sure to arise in the course of production, but this department was largely placed in control of the airplane design itself, which the Airplane Experimental Department had failed to establish satisfactorily.

The new department was never informed or equipped so that it could perform its function adequately. It was under the general supervision of the head of the Production Department of the Equipment Division, who was inexperienced in airplane engineering or in airplane production, and this creation of another inadequate department failed to solve the difficulty.

On Feb. 6, 1918 the Airplane Engineering Department was established in charge of Lt.-Col. Vincent, who was put in command at McCook Field. Lt.-Col. Vincent at once began to direct the efforts of the new department toward getting some well known machines ready for production, rather than doing the purely experimental or research work, and he obtained permission from Mr. Potter to take the DeHaviland 9 from the Dayton Wright Co., at South Field "and put it through McCook Field."

But this new department did not have a definite function with respect to the types of service planes already under contract, that is, the DeHaviland 4 and the Bristol, and these were left apparently as before, subject to the inadequate direction of the Production Engineering Department.

The consequences are easy to trace. When the model DeH-4 was received in this country it was accompanied by the English drawings. It was necessary to re-design the plane to accommodate it to the Liberty motor.

The model was sent to the Dayton Wright Airplane Co., and this company, which under its contract was to produce in accordance with drawings and specifications furnished by the Government, appears to have undertaken the work of redesigning and making the new drawings.

These were made and the DeH-4 as re-designed was flown on Oct. 29, 1917. When, later, changes were required the company expected drawings to be furnished by the Signal Corps; the Production Engineering Department apparently expected the drawings to be provided by the company.

Rapid and successful production which demanded clearly defined responsibility could not be expected under such conditions. About Feb. 21, 1918, the Production Engineering Department having been unable to secure production, the work on the DeH-4 was virtually taken out of its hands and placed in charge of Lt.-Col. E. J. Hall for the purpose of a swift effort to get results.

Lt.-Col. Hall proceeded to get necessary information as to equipment, developed a little organization of his own, at once built three model planes (one for the Dayton Wright Airplane Co., one for the Fisher Body Corp. and one for the Standard Aircraft Corp.) and sought to remove as rapidly as possible the various hindrances to production. In this way, production in quantity was finally attained.

But this was not the perfecting of the organization, but in substance was a desperate effort outside the regular instrumentalities of the Equipment Division because those instrumentalities could not be relied upon.

With respect to the development of the Bristol, similar conditions existed. When Lt.-Col. Hall had made sufficient progress at the plant of the Dayton Wright Airplane Co. to warrant it, he turned his attention to the production of the Bristol, at the plant of the Curtiss Aeroplane and Motor Corp.

As he testifies, "they were worse than at a standstill." "It would have been easier," he says, "for me to have taken and designed the whole machine around the equipment if they had not had the material started." He found that practically all they did was to get in a row, so that the condition when I went in there was that everybody was damning everybody else." This was about April 11, 1918.

It appears that Captain Clark in the fall of 1917 began the work of re-designing in order to adapt the Bristol to the Liberty motor, and about the last of October the model Bristol with a large number of drawings was sent to the Curtiss company.

Mr. Mueller, who was the chief engineer of the Curtiss company, states that they were unable to make the plane from the drawings that "the dimensions would not check up" and that "it was impossible to get the machine together from the parts made from the details of the Signal Corps drawings."

In January, 1918, the Production Engineering Department took over the work on the Bristol, but differences with the contractors speedily arose, and at the end of January, for the purpose of reconciling these differences, a conference was held between the representatives of the Signal Corps and of the company, respectively, and it was determined that engineering decisions should thereafter be left to the engineer of the Curtiss company.

This authority apparently was exercised for two or three weeks, but opposition developed and there was no real progress. Lt.-Col. Hall took the matter up in April and an effort was made to drive through to production.

It is apparent, however, that this plane never got beyond an experimental stage, and yet 400 were released for production in March and 400 more in April. This was evidently in response to criticism of delays. But the plane as designed for the Liberty motor was doomed to failure. Had there been an adequate engineering department to settle the matter of design and make the necessary engineering tests and decisions before production was entered upon, much time and money expended in fruitless effort would have been saved.

Throughout this period the Equipment Division of the Signal Corps presented an organization with a host of sections and departments, with ill-defined functions, creating disorder and confusion rather than sustained, well directed and expert effort. There was a vast amount of lost motion.

Manufacturers were brought into contact with various divisions with overlapping powers; earnest and able scientific men, who were brought into particular sections, found themselves lacking in authority or in conflict with other sections; and uncertainty, indecision and vacillation enfeebled the entire undertaking.

Military organization was another obstacle to the rapid prosecution of what was essentially an industrial enterprise. Whatever might be accomplished by such an organization in a thoroughly understood activity, it was certainly unsuited to an entirely new industrial endeavor of this sort.

A mobile force in which men could readily be moved about, tested, elevated and deposed without regard to military rank or precedent, was absolutely required. The inherent difficulties of the situation were thus greatly increased by defective organization. No doubt, also, the swift creation of a large force of inspectors, without the qualification of experience in their line of work, not only opened the door to abuses, but to an extent retarded production.

The situation, as it appeared to Archer A. Landon (Mr. Coffin's assistant) more than six months after we had entered the war, is strikingly shown in his letter to Mr. Coffin dated Oct. 16, 1917, in the course of which Mr. Landon said:

The lack of organization and continuity of responsibility is so apparent that success will be a miracle. If we are to be successful there must be fixed, from the Secretary of War or the Secretary of the Navy down almost to the office boy, a direct line of responsibility that will make every individual assume the absolute responsibility for the work he is undertaking and under no circumstances should any conflict of authority or responsibility occur. Industrial men of known responsibility and capacity for the particular work undertaken must be selected. They should be peculiarly fitted for the position they occupy and should be responsible for their work as in civil life.

We men who have come here in an effort to assist you find ourselves very seriously embarrassed and justly so. We are started off to do what seems to be an important piece of work only to find that this work has been delegated to somebody else in some other department and that we are treading on other people's toes. The result is that we do not get the information we want and we do not get anywhere. They do not throw us out, but they are all adept at pulling the latest Washington game of "passing the buck," or else, frankly, resenting our appearance in the matter.

Take the spruce situation as an example of dilly dallying through a lack of organization. The first I knew of the spruce situation was around the latter part of July or the first of August. At that time it was one of your great worries. The entire aircraft program was and is now endangered by the lack of ability to get spruce; and yet from that time until now, notwithstanding repeated conferences, there was nothing done on the spruce situation, either towards closing contracts or increasing production, until October 13th, when Colonel Disque was sent west on the situation; a loss of time of practically three months. If this had been your own business, the men would have been on their way west the day after the matter was first brought up. The only reason that there was no action in July was because we do not possess an organization of direct responsibility and on that account these inefficiencies are possible and they will continue to occur until such time as somebody wakes up and thoroughly organizes the work.

After giving a further illustration, Mr. Landon continued:

This is not intended as a criticism of General Squier or the other officers, but it is intended to be a very vigorous criticism of methods of organization that make such a condition possible; and I submit to you, s.r., that, if this same condition exists in all departments and continues to exist, we might as well submit to the Germans now, because the one way you can beat efficiency is to match it with efficiency, and efficiency can only be obtained by a thorough organizing of our responsibilities and following them through to a definite conclusion, which conclusion should be the winning of the war.

Mr. Landon, leaving the aircraft work in October, 1917, returned to it in June, 1918, then becoming chief of the Production of Aircraft in the Bureau of Aircraft Production. Up to that time, the policy he had recommended had not been carried out. He testifies that he "could see practically no change in the organization in six months;" that is, prior to the new organization through the Bureau of Aircraft Production which had just been instituted.

It should be understood, of course that the complaint so emphatically voiced was not directed at the Aircraft Board, as this, as Mr. Landon stated in his letter, was "merely an executive advisory board." The responsibility lay with the officers entrusted with the duty of effecting an adequate organization for aircraft production.

### Third: Lack of information as to the equipment required for Service Planes

The model DeHaviland 4 was not received until about the beginning of August, 1917, and, as already stated, it was necessary to re-design it and make new drawings. But whatever delay was due to a failure to obtain a model earlier, or to the necessity of re-designing the plane, was greatly increased by the lack of needed information as to the equipment which was to be put in.

From the time the model machine, as re-designed, was completed and flown on Oct. 29, 1917 several months elapsed before its equipment was finally determined upon. The engineer of the Dayton Wright company testifies that "the information which we were anxious to receive and which was necessary for production was not forthcoming until the middle of April."

There appear to have been several reasons for this. There was always the difficulty created by lack of experience in equipping airplanes for service in war and there was considerable trouble in obtaining some portions of the equipment. But, in addition, it appears that there was a lack of exact and detailed information as to just what was required.

The drawings and the specifications which accompanied the sample plane sent here were supposed to designate defin-

itely the apparatus to be put upon the planes and its location. The testimony is that these drawings and specifications "did not check up with the actual plane," and there was resulting uncertainty as to what should be done.

Communications with the other side were had frequently with regard to instruments, accessories and various parts of equipment, but, despite this, the uncertainty seems to have continued for a long period and there was apparently an inability to frame a definite bill of material which could be given to the manufacturer. The showing indicates either an extraordinary lack of decision on the part of those whose duty it was to decide, or an even more remarkable absence of administrative efficiency in seeking and obtaining necessary information.

About Feb. 10, 1918, definite instructions were received from the other side as to the armament and instruments of the DeH-4, but these instructions involved serious changes in the plane. And, subsequently there were further changes in equipment, as stated below, causing still further delay.

### Fourth: Changes in design and equipment of Service Planes

The following statement, set forth in the testimony of Mr. Schoonmaker, the engineer of the Dayton Wright Airplane Co., which is substantially uncontroverted by the representatives of the Signal Corps, is an illuminating description of the delays in production incident to changes in design made necessary by changes in equipment so far as the DeHaviland 4 is concerned and also indicates the waste thereby occasioned. It will be observed that changes were made necessary not only by new requirements as to equipment, but by inaccuracies in drawings and various defects. Mr. Schoonmaker testifies:

The first sample DeHaviland machine was received on August 14, 1917. This was accompanied by an incomplete set of drawings, but with the machine as a sample and with what drawings we had at hand, we were able to complete the necessary lay-out from which to build one sample machine which was flown on October 29, 1917. This plane was satisfactory in every detail as a machine and practically no changes have been made in the construction except where they were affected by the equipment which the machine was to carry.

We were advised at that time in answer to our request for information on guns, that the machine was to be equipped with the Vickers Gun and that the gun mounts would necessarily be the same as the English gun mounts. This information was requested by the Dayton Wright Company during August when the preliminary lay-outs of the machine were being made. At a late date we were advised that the Marlin Gun would supplant the Vickers, and that the Signal Corps would take care of the necessary design of gun mount, etc. The front gun mount design was received on January 8; after a conference with Signal Corps men, it was decided that this mount would not be satisfactory and, therefore, was discarded. The Dayton Wright Company produced a design of gun mount and cartridge box which was built and installed and accepted by the Signal Corps after a firing test on January 26.

Owing to the fact that the Marlin Gun was not similar to the Vicker, a complete re-arrangement of the cowling over what had already been designed was necessary. The first drawing of the Marlin Gun which we received was delivered to us on February 12 but no bill of material on the complete gun equipment accompanied same. On February 26 we were requested to mount two stationary guns on the forward cowling. This necessitated a re-design of the gun mount already ordered into production, and this work was carried on by the Signal Corps. This also affected all cartridge boxes of which drawings had been made and which were released to production. A re-design of the cartridge boxes for the double gun mount was furnished by the Signal Corps on March 5. This design was not satisfactory as the drawings were incorrect and the pieces manufactured from them did not assemble in the machine. A new re-design was furnished by the Signal Corps on March 15; parts were made from these drawings and were released to production. On April 1 the Dayton Wright Company was ordered by the Signal Corps to again re-design the cartridge boxes changing certain dimensions; since that date few minor changes have been necessary, but nothing which directly interfered with the production of these parts.

Changing the gun equipment as mentioned above, necessarily changed the shell chute lay-out. The first drawing which we received from the Signal Corps for the left hand gun chute came to us on March 5. Parts made from these drawings were not satisfactory as they did not assemble in the machine. The Signal Corps corrected these drawings and sample parts were made and the Dayton Wright Company's drawings were released for production several days later. The Signal Corps found, however, that these samples were not satisfactory and they were rejected as there had been an error in the drawings. The Dayton Wright Company re-designed the chute for the left hand gun on March 29. Samples were made from these drawings which were satisfactory to the Signal Corps and released to production on April 7.

The first right hand shell chute was laid out by the Signal Corps on March 6. Samples manufactured from these drawings were not satisfactory and did not assemble properly in the machine. The Signal Corps proceeded on the correction of these drawings and they were released for the production of sample. These drawings were very difficult to work to and samples manufactured from them were not satisfactory and rejected.

The Dayton Wright Company produced a new design of this shell chute on March 29, which before samples could be made and tried out, it was seen that a new design would be necessary due to the change of location of the electric generator for the electrically heated clothing. A new design was started by the Dayton Wright Company on March 30.

A design along entirely different lines had been started in the meantime by some Signal Corps men at South Field on March 29, and this type was approved on March 31 by the Signal Corps and drawings were made and released to production. This design was tested out on the evening of April 2 and proved unsatisfactory.

Another new design was started by the Signal Corps on April 3, which after a few modifications was released to production on April 11.

The same procedure of re-design and development as was required for the shell chutes applies also to the cartridge box and shell chute covers.

Our first request for information on the synchronizing device was in November, 1917, but up to February 14 no bill of material or complete set of drawings had been delivered. We received on January 23 a few parts which were intended for production, however, the assembly was incomplete and the parts made would not fit the engine. We received drawings of the hand pump on February 5. During January a sample hand pump was delivered to South Field; no drawing or instructions accompanied this to show mounting and this office was never advised as to its use. When assembled on the machine in January, it was found that an interference was encountered with the gasoline shut-off cocks and strainer, necessitating a re-design of these parts and the transferring of them to the other side of the fuselage. This in turn caused an interference of the spark and throttle controls necessitating scrapping of parts then on hand and re-design of this layout.

The first synchronizing outfit which we received caused a considerable amount of trouble and upon examination of the trigger motors, it was found that practically no two of them were alike and it was almost impossible to get a pair of guns on a machine which would function correctly. The first synchronizers were delivered directly to us instead of the engine builder, and they were not made so as to be directly interchangeable with the motor crank shaft, the result being that a considerable amount of hand work had to be done in the fitting up of these synchronizers.

On April 2 it was found that the synchronizer generator did not have a satisfactory lubrication system and it was necessary to connect it to the motor oiling system. This necessitated the disassembling of the synchronizer head and welding on a special boss for the attachment of this oil line. This has been done on all of the synchronizers to date.

Information, drawings and bill of material for the gun sights were requested on October 19, 1917. A list of different types of sights were received on January 4 but no bill of material or drawings. Drawings for wind vane sights were received February 6. No drawings were ever furnished on any of the sight mounts, however, the sight locations were approved February 13.

This will recall that it was advised that the old English DeHaviland be used for the mounting of guns and sights so that all of the difficulties which were likely to be encountered, could be worked out on this job. Our engine cowlings was held within the limit of the cowling used on the English job so that no interference would occur. On November 20, it was called to the attention of the Signal Corps that no use had been made of this machine to date, and early in the Spring was shipped to Wilbur Wright Field.

On April 6 the location of the Aldis sight was removed and changed to the left hand side of the right gun; this necessitating a change of all the parts which had been made up for the old sight and which were already released to production.

Our first instructions regarding the bomb dropping gear were to equip the DeHaviland machine with two rails similar to the English machine. Information had continually been requested on bombing apparatus but no drawings could be furnished. On January 18 we received our first information from the Ordnance Department on Bomb Gear. This was merely an unlocking device and we gave space in our drafting room for several Ordnance Department men to complete their drawings for application to the machine, they being turned over to me on February 1. On going over these drawings, it was found that they were not complete and about a week later more drawings were received which assisted in production of the first model gear. The delivery of this apparatus has been sadly deficient, it being necessary to ship a large number of planes without it, as some of this is built in the floor of the fuselage and must be put in during the various assembly operations. A further change on the operating mechanism of the bombing gear is coming thru which will be incorporated possibly on the five hundredth machine.

Information was requested during October, 1917, on the camera and camera mounts. We were advised at that time that the camera mount which the English DeHaviland was equipped with would also be used on the American-made machine. On January 19 we received from the Signal Corps a camera which would not fit the English mount. As the English mount was already built into a number of fuselages, it was impossible for us to change this part of our early shipments. A new design of mount was made by the Signal Corps and installed in the sample machine in our shop. On February 25 this was rejected by the Signal Corps and a new design started and drawings furnished on same May 27.

The focusing lens retainers were designed at the direction of the Signal Corps for a 4" x 5" lens. The location of these was shifted several times and the size of the lens was changed by the Signal Corps to 5" x 6" and the drawings for retainers were furnished on April 2.

Up to February 14, we had no information on oxygen apparatus except that it was to be part of the equipment. As late as April 6, we had no samples of the apparatus or drawings showing installation of same. Final approval of the oxygen installation was received June 10.

Drawings for the radio equipment and first information regarding same came to us February 1. These were recalled for changes and new set issued which were illegible. These were returned and on February 8 a new set of drawings were received for the bonding together of all metal parts on the machine; these drawings could not be followed on a production basis. The Dayton Wright Company then prepared a sample machine and drawings were made from this and accepted by the Signal Corps March 25. Radio instruments were received February 20 and installation according to Signal Corps drawings was stopped February 25 and new installation directed. The Dayton Wright Company prepared drawings for this installation and wiring according to the sample which was prepared.

On March 28 the generator mount on the side of the fuselage was abandoned. A new installation was furnished by the Signal Corps but was found that it interfered with the landing gear strut. On April 10 the new design from the Signal Corps showing the correct location of the generator was received.

Considerable trouble was encountered with the installation of the Holt flare lamps as there was a misunderstanding between the Dayton Wright Company and Signal Corps as to who was to furnish them. The first Holt flare lights were received on February 25.

The first navigation light samples were received on March 20 and wiring instructions for same were delivered a few days later.

The electric generator for lighting and heating was received on March 15. The Signal Corps drawings showed the location on the side of the fuselage. This was unsatisfactory as the generator propeller interfered with the rear flying wires of the wing structure. The Signal Corps prepared new drawings for the re-location of this generator but these were unsatisfactory owing to the interference with the landing gear strut. On April 9 a new set of drawings were received showing the correct location of this generator.

Radiator and water lines were approved by the Airplane Engineering Department, Signal Corps on November 21 after flying test. At this time, of course, there was practically no information at hand regarding the equipment of the DeHaviland plane which necessarily added considerable weight, so that the radiators which we had ordered for production were considered unsatisfactory by the Production Engineering Division. The radiators furnished by the Signal Corps were 1" deeper in the core which necessitated re-design of the shutter assembly. At a late date it was decided to make a further change on radiator design, making it 4" longer. This affected the under cowling of the motor, the forward cowling water lines and numerous other details entailing a large amount of scrapping and re-operation of parts.

The Signal Corps advised that they would furnish us short radiators for our first 150 ships and long radiators for the next 100, after which we were to supply our own. A shortage of 50 radiators was encountered in the first agreement which necessitated us going to the long radiator job 50 machines earlier, which caused a serious delay and complication in the shop.

Drawings were received from the Airplane Engineering Division, Signal Corps, November 21 on gas and air lines. From these drawings all parts were ordered into production. All gas and air line connections were changed by the Signal Corps and final information received on this change April 6. This necessitated scrapping of all parts on hand and a delay was occasioned in securing necessary new material.

The delays at the plant of the Dayton Wright Airplane Company, due to these changes in design, also caused delay in the other plants which were to produce DeHaviland 4s, for both the Fisher Body Corporation and the Standard Aircraft Corporation were awaiting a definite design and a determination of equipment and proper drawings before proceeding to production.

The Dayton Wright Airplane Company was in advance simply because it had the advantage of the possession of the model and it was working out the necessary drawings.

It will be observed that these changes were required in the course of production. That is, instead of proceeding with production on the basis of a given equipment where changes in equipment would cause serious delay, and introducing different equipment in the planes subsequently produced, virtually the entire production was held up to accommodate the new demands.

As Lt.-Col. Horner testifies, "We would go on changing this way and that way and let that change go through production, when it could be done without interfering with production, and if we had done it we would have had a thousand more planes on the French front to-day than we now have without any question."

It is unnecessary to review the changes in the ill-fated Bristol. They were numerous and related to the structure of the plane itself. Production was of course impossible while these changes were in progress. The real effect of the changes, however, in view of the result, was not to retard the production of a useful plane, but to cause an unnecessary expenditure.

#### Fifth: Conditions in Manufacturing Plants

The conditions in certain plants engaged in the manufacture of airplanes were unfavorable to production, not only because of lack of experience and the absence of mechanics trained in that class of work but because of defective organization and want of efficiency. The Dayton Wright Airplane Company had the difficulties inherent in a new organization, but in view of the changes that were required in the course of production it would be impossible to define to what extent, if any, production was retarded by reason of the fact that the organization was a new one.

The lack of competent organization at the North Elmwood plant (Buffalo) of the Curtiss Aeroplane & Motor Corporation is commented upon later (*post*, pp. 150, 156), but in view of the cancellation of the Bristol order it need not be considered here.

Whatever delay there was, was in the course of an attempt to make an impossible plane. At the plant of the Standard Aircraft Corporation conditions were also far from satisfactory, but for the same reason, so far as service planes are concerned, its capacity for production was not put to a proper test. It should be added that at this plant the first Handley-Page was assembled and successfully flown within ninety days after the company had been given full charge of the matter.

There have not been lacking indications of sinister influences at various plants. The opportunities of workmen at aircraft plants to retard production or to injure material and product are quite obvious and the necessity of keeping the plants free of enemy influences is emphasized in another part of this report. But, so far as the delays in production of

service planes are concerned, it is impossible in view of interrupted work and changing plans to attribute the delays in any definite measure to such a cause.

#### Sixth: Changes in the Liberty Engine

In any proper estimate of what should have been accomplished in carrying out the aircraft program it is necessary that regard should be had to the development of the Liberty motor. The airplane must have its motor, and it was inevitable that in the development of a new high-power airplane engine, with the object of securing higher power with a lower weight per unit of power, that changes would be found necessary.

Needed improvements were constantly suggested by experimentation, and the number of changes looms very large in the testimony of the experienced engineers who were endeavoring to get into quantity production. It is unnecessary to attempt a review of these numerous changes, for whether time could have been saved by greater expertness is a matter of opinion, and in view of the time that has frequently been spent in the development of new types of motors, there is slight ground for criticism by reason of loss of time in perfecting the Liberty motor.

The difficulties were inherent in the task and the task itself was worth while. As has been said, there was no reason why the development of the Liberty motor should have stood in the way of the production of other motors, such as the Hispano-Suiza, for use in single-seater pursuit planes to which the Liberty engine was not adapted.

But, so far as the heavier observation and bombing planes are concerned, the weight of opinion is that it would have taken about as long to put any other high-power motor into successful quantity production in this country, according to our methods of manufacture, as it has taken to develop the Liberty motor.

The attempt to secure planes and motors through foreign production for service pending this development has already been reviewed. By pursuing different methods it is possible, as testified by Lieut.-Col. Hall, that there might have been a small preliminary production of Liberty motors two or three months earlier; but, making due allowances for the inevitable course of experimentation, the Liberty motor could not have been put into large production much earlier than it was.

What has been called the "immaturity" of the Liberty motor placed a time limitation upon the program for the planes that were made to take this motor, but it may be observed that by May 4, 1918, 778 Liberty motors (U. S. 12s) had been made, of which 390 were taken by the army, and only 36 DeH-4s had at that time been delivered, and no other army planes to take this motor were available.

It can hardly be said that unnecessary delays in service-plane production, caused by bad organization and lack of a settled design, were excused by unforeseen difficulties in the development of the Liberty engine; and it should also be observed that if, in the light of general experience in motor building, delay in the development of the Liberty engine was to be feared, there was the greater reason for making sure, to the full extent of ability, of the immediate production of single-seater pursuit planes for which other engines could be provided.

#### EIGHTH. CONTRACTOR'S PROFITS

Under the various fixed-price contracts it is probable that large profits have been gained, but definite information as to their extent would not be available without a survey in detail of manufacturing conditions and costs in a considerable number of plants, an undertaking which would have been wholly impracticable in this inquiry. The profits allowed by the cost-plus contracts present a distinct question.

The justification for cost-plus contracts was found in the fact that the undertakings were novel and that the manufacturers did not have accurate data upon which to make a satisfactory estimate of the cost of production. This was conspicuously true in the case of airplanes of types with which manufacturers in this country had been unacquainted previously.

For production in large quantity, either new plants or greatly enlarged facilities at existing plants, as well as special tools, would be required to meet an exigency of uncertain duration, and it would also be necessary to procure the requisite labor and materials for the new undertakings in a rising market and to provide working capital for long periods.

And while motors had been manufactured here upon a large scale, the newly-designed engines for the service airplanes required such a reduced weight per horse power and

such delicacy of construction that it was felt that the enterprise had many elements of uncertainty.

In these circumstances it was not an unreasonable conclusion that if contracts for the new types of airplanes and for the new engine were offered solely on a fixed-price basis, either manufacturers would not undertake the work or would insist upon high prices as a safeguard against the chances of ultimate loss.

It was deemed inexpedient for the Government to undertake the manufacture directly, and it was decided to adopt the alternative of an assumption by the Government of the cost of manufacture through contracts upon a cost-plus basis.

This practice, however, could not properly outlast the reasons which may have justified it at the outset. Contracts of this sort lead to waste, foster abuses, and impose an almost intolerable burden of cost accounting, in itself a hindrance to rapid production. Early in this inquiry it was abundantly shown that it was highly important to establish reasonable fixed prices whenever experience afforded a fair basis for estimates.

The principal features of the cost-plus contracts for airplanes and engines may be said to be these:

- (1) The payment by the Government of the contractor's outlays for labor and materials and for the overhead charges incident to the work;
- (2) The payment by the Government for special tools and certain "increased facilities" located in the contractor's plant, but owned by the Government;
- (3) Reimbursement by the Government for depreciation;
- (4) A fixed profit to the contractor; and
- (5) The fixing of an estimated cost, or "bogey," and a division of whatever saving was effected under this estimate so as to give 25 per cent of this saving to the contractor as additional profit.

It will be observed that by this method the contractor is assured not only the payment of the cost of labor and material used in the process of manufacture, but of administrative outlays for management and supervision, and an allowance for depreciation of plant.

To the extent that these payments are made promptly and at short intervals the working capital required would be reduced. Provision has also been made for the supply of needed assistance by means of advances through the War Credits Board where these are deemed to be justified.

The contractor is guaranteed a certain profit regardless of cost. This is called the "fixed profit." And finally, the fixing of a "bogey" cost was designed to counteract the temptation to wastefulness by giving the contractor a substantial share in the fruits of economy.

And it may here be noted that the popular impression that under this form of contract the contractors receive the same amount of profit, however wasteful they may be, and have no incentive to avoid unnecessary outlays, is without foundation.

The bogey costs were in all cases placed so high that the contractor had every reason to expect that the actual cost would be much less, and that through its share in this saving the contractor would be able to derive an increased profit from economical management.

It is apparent, however, that with a large fixed profit guaranteed the incentive to economy is not as strong as when the entire venture is at the contractor's risk.

And particularly when interruption of work and changes in design vex production managers, and it is difficult to maintain economical methods, there may easily be bred an indifference to an excessive cost where its burden falls upon the Government.

At least this is to be inferred from conditions in certain plants, and the conclusion is unescapable that the cost-plus system of contracts for the manufacture of commodities, as distinguished from such contracts for mere service, is a vicious system, and is to be tolerated only during such period as it is found to be absolutely necessary to secure immediate production.

The fact, however, that a cost-plus system is deemed advisable for a time does not justify an exorbitant fixed profit. It has already been pointed out in the case of the Dayton Wright Airplane Company that the contract for DeHavilland-4s originally called for a fixed profit of \$875 per plane.

This was arrived at on the basis of 12½ per cent of the bogey cost of \$7,000. This, however, was not an actual cost, and, as the event has shown, was very far above the actual cost. If it had been thought fair that there should be a profit of 12½ per cent per unit produced, it would have been a simple matter to have given this percentage of the actual cost, as the actual cost was to be ascertained in the course of the accounting and provide for payments from time to time on account.

There is no conceivable reason for giving a percentage of the bogey cost, if the object were merely to assure the cor

tractor a profit equivalent to a given percentage of cost.

The actual cost of the DeHaviland-4s at the plant of the Dayton Wright Airplane Company, despite all the difficulties of production and the enhanced cost of the first lot of machines produced during a period of many changes in design, is understood to be under \$4,400. A fixed profit of 12½ per cent on the actual cost of each machine would have been about \$550, instead of the \$875 which was fixed by making the calculation on the bogey cost.

Again, in a contract for manufacturing articles at the contractor's plant, the agreed profit upon a cost-plus basis should have a proper relation to the contractor's actual investment and risk.

The contractor is not only reimbursed for his outlays for labor and material, but for expenses of management included in overhead charges, including such reasonable salaries of officers, managers, etc., as may properly be allocated to the Government's work.

There is no sacred formula by which the Government is bound to pay a profit per unit of production regardless of the time in which capital is turned over. The extent to which the Government supplies the needed working capital, either by payments on account of work and materials supplied, or through advances, should also be considered. A percentage of outlays, or of a bogey cost, although small in itself, may give an exorbitant profit as applied to each unit of a large production.

#### Service Airplane Contracts

In the case of the Dayton Wright Airplane Co. the paid-in capital was \$1,000,000 invested in plant. Advances by the Government to the extent of \$2,500,000 were authorized and in December and January last advances of \$1,000,000 were actually made. These were followed by additional advances, and the balance of total advances on June 30, 1918, was \$1,405,222.57.

Approximately \$750,000 of the money thus borrowed from the Government at interest is represented by investment in fixed assets. The plant is exclusively devoted to Government work, and outlays for labor, materials and overhead, as provided in the contract, are met by the Government.

The operations of this company relating to production may be said to have begun about Aug. 1, 1917. The total fixed profit on 400 Standard-J planes was \$620 per plane, and the fixed profit on the 4000 DeHaviland-4s was \$875 per plane, making a total of \$3,748,000.

With the saving as now estimated of approximately \$2,600 under the original bogey cost of \$7,000 the additional profit of 25 per cent of this saving would amount to \$650 per plane, making the total profits on the DeHaviland contract about \$1,525 per plane.

At the present rate of deliveries the contract for 4000 DeH-4s will be completed before March 1 next. The total profits on the 4000 DeH-4s would have amounted to upward of \$6,100,000, and it is safe to say that including the profit on the Standard-J planes, the company would have earned a profit of more than \$6,350,000 under the original contract.

This does not include whatever profits would have been made on its experimental contract or on the spares for DeH-4s. It should also be added that under its contract it was provided, in substance, that at the completion or cancellation of its contract the Government should pay the difference between the cost of its plant, including real estate, building, machinery and appliances built or otherwise acquired for the performance of the contract, less what was found to be the fair market value at the time when the contract was completed or cancelled, and that in determining (through a board of appraisers) this fair market value, the need or requirement of such a plant in the neighborhood and the probability of securing a tenant promptly, or having an established business available, should be considered as one of the important factors.

In the case of the Fisher Body Corporation, which had the other large order for DeHaviland-4s (4000), as well as an order for 400 Standard-Js, the profits would certainly not have been less. Instead of establishing a new plant, as did the Dayton Wright Co., the Fisher Body Corporation had already effected a highly efficient organization and had an established plant, which required, however, a considerable expansion of plant facilities and special equipment.

The net investment in fixed assets, including building, land and machinery, which was made by the Fisher Body Corporation for the Government work amounted, to May 31, 1918, to \$860,849.05. The corporation was aided by an advance through the War Credits Board of \$2,000,000, made last December. Waiting for the necessary drawings, it got into production later than the Dayton Wright Company and up to Oct. 11, 1918, had only delivered 452 planes. But it should complete

its production of the entire 4000 within the next six months.

As already stated, in accordance with letters obtained at the time the contracts were made with the Dayton Wright Airplane Co. and the Fisher Body Corporation, which promised an equitable readjustment if it was found that the bogey cost was too high, it appears that contracts are now being negotiated for the reduction of the bogey cost of the DeH-4s to \$5,000 and the fixed profit to \$625 per plane. The total profit per plane with the percentage of saving (exclusive of profit on spare parts) under the new contract would amount to about \$775 per plane, or \$3,100,000 in all, which with the profit on spare parts would make the total profit on the DeHavilands not less than \$3,500,000.

#### Liberty Engine Contracts

The bogey cost, as first fixed in the contracts for Liberty engines, was \$6,087. This was approved by Mr. R. H. White of Cleveland and Mr. Henry May of Buffalo, to whom the propriety of the estimate had been submitted by the Secretary of War. The fixed profit as originally stipulated was 15 per cent of this bogey cost, or \$913.05 per engine. Lieut.-Col. Hall (who had had large experience in engine manufacture) testifies that he made an estimate about the time that contracts were being let, and told Colonel Deeds, that \$2,400 would cover the cost of labor and materials for the Liberty engine, without overhead charges.

In December, 1917, the bogey or estimated cost was reduced to \$5,000 and the fixed profit put at 12½ per cent of this sum, or \$625 per engine, and the contracts with the Packard, Lincoln and Nordyke & Marmon companies were modified accordingly. This was in consideration of further allowances for depreciation and provision for advances by the Government. In last May, the contract with the Ford Motor Co. was modified by the same reduction of the bogey cost and fixed profit. The contracts with the General Motors Co. were put upon the same basis.

Even at this reduced bogey and percentage, the profits allowed were very large.

By Sept. 6, 1918, that is within a year from the date of the contract, the Packard Company had delivered (according to the Government's report) 3100 Liberty-12s, and the agreed fixed profit on these amounted to \$1,937,500.

In the following month it produced 560, and it should complete its deliveries of the 6000 first contracted for not later than January, 1919, and on these 600 engines the agreed fixed profits would be \$3,750,000. This profit it would earn within seventeen months after it received the contract, and if it could have completed the deliveries as contemplated when the contract was made, that is according to contract schedule, the profit would have been earned in eleven months.

Only the fixed profit has been mentioned, as this was definitely guaranteed, but in addition to this the company was entitled to 25 per cent of its saving under the bogey of \$5,000. The Government's estimate is that the actual cost of the first 600 Liberty engines produced at the Packard plant was \$3,873 per engine, and that the average cost of the first 1200 motors was thus \$3,442 per engine.

It would seem that the actual cost of the entire 6000 is likely to be somewhat under \$3,200 per engine. But on the basis of \$3,200 there would be an additional profit, through the contractor's percentage of saving, of \$450 an engine, which would make \$2,700,000 additional profit, or with the fixed profit of \$3,750,000 a total profit of approximately \$6,450,000 earned on the 6000 engines, within a year and five months, despite delays in production.

To this there should still be added a considerable amount for profits on spare parts on the 6000 engines, which may be estimated at upward of \$1,500,000, and thus the aggregate profits on the Liberty engine (exclusive of the original development work) would reach about \$8,000,000.

The Packard Company estimated that on May 31, 1918, from the standpoint of plant values, the total investment exclusively for aircraft motor work was \$11,808,404.47.

This included, however, advances by the Government for working capital amounting to \$2,145,568, and inventory and other items which would be represented in the cost of labor and material ultimately defrayed by the Government.

The proportion of its plant, less depreciation, employed on aircraft work was estimated by the company at \$5,500,000. It should also be noted that in the contract reducing the bogey cost and fixed profit, it was provided that on the termination of the contract the Government should pay for depreciation upon the heat-treating building and equipment erected by the contractor for the purpose of carrying out the contract, the difference between their cost and "the value thereof to the contractor for use in its business," as determined by a board of appraisers; and that in determining this value the appraisers should be guided by the use the con-

tractor "shall have for said building and equipment at the termination of said contract, in the ordinary operation of its business of manufacturing motor cars and trucks, and shall not include the value, if any, which the same may have to the contractor in the manufacture of further aviation motors."

The Government was also to pay the full cost of facilities for testing and inspecting the engines, including the building and equipment erected by the contractor therefor, and should also reimburse the contractor for the machine tools purchased especially for the construction of aviation engines, to be used by the contractor without rental but to remain the property of the Government.

The contract with the Ford Motor Co. was for 5000 Liberty engines. The company did not begin its deliveries until the 14th of June. It was estimated by its officers that deliveries would reach 1500 in October, and that the entire contract would be completed by the first of December.

It is behind its schedule, but between September 6 and October 4 it delivered, according to the Government's records, 768, and it may be expected that it will complete its contract for 5000 by the end of January, 1919.

Under the original contract it would then be entitled to fixed profits on the 5000 engines of \$3,125,000, and the additional percentage of the saving under the bogey cost of \$5,000.

With its well-known efficiency, and in view of the fact that by beginning later it did not have as much difficulty as the Packard Company had experienced, it may be assumed that the actual cost of the 5000 engines at the plant of the Ford Company will be less than \$3,200 per engine and at the rate of \$450 an engine (that is 25 per cent of the difference between \$3,200 and \$5,000) its additional profits would amount to \$2,250,000, or its aggregate profits on the 5000 engines would be \$5,375,000, earned by January, 1919.

The plant investment required for this production certainly cannot be regarded as any greater than that on the part of the Packard Co. The Ford Co. has not received advances from the Government. The Ford Co. also has a contract for 400,000 cylinder forgings for the Liberty engine, on a fixed price basis of \$8.25 each; these are supplied to the other manufacturers.

The contract with the Ford Co. for the Liberty engines provides that there shall be allowed for depreciation on the machinery and buildings especially acquired for the performance of the contract, in addition to the facilities already owned by the contractor, the difference between the fair cost and the fair market value as determined by appraisers at the time of the completion or cancellation of the contract.

The Lincoln Motor Co. has its special feature in that it was a new organization and established a new plant which is devoted exclusively to the manufacture of Liberty engines for the Government. It has a highly expert organization, with Mr. Henry M. Leland at the head. When the bogey or estimated cost was reduced from \$6,087 per engine, with a fixed profit of 15 per cent, to \$5,000 per engine, with a fixed profit of 12½ per cent, the Government made a special agreement with reference to depreciation, which is thus summarized in a resolution of the Aircraft Board:

That the Government make an allowance for depreciation of the company's heat treating plant equal to the difference between the cost thereof and the value to the company of the business at the termination of the contract; further, that the cost of the company's testing plant be allowed as a part of the production cost of the engines to be manufactured; further that the machinery and equipment used by the company in the performance of the contract be depreciated 40 per cent over the term of the contract.

The Government made advances during the last fiscal year to the extent of \$6,500,000; additional advances were made in July and August of \$4,300,000, in order to discharge obligations and maintain a capacity of 1500 engines a month, making a total sum advanced by the Government of \$10,800,000.

The Lincoln Motor Co. had delivered, according to the Government's reports, only 580 motors by the end of June, but it had reached a production of over 600 per month by Oct. 4, and doubtless will soon be at full capacity so that the first 6000 motors will probably be delivered before the end of January.

For the first 600 motors the cost of production at the plant of the Lincoln Motor Co. was \$3,583, which was nearly \$300 per motor less than that of the Packard Motor Car Co., and it may be assumed that its average cost for the entire 6000 will be not much, if any, more than \$3000.

That is the figure which appears in the company's estimate of profit. But on the basis of an actual cost of \$3200 per motor the Lincoln Motor Co. would have earned by January, 1919 (through fixed profits and percentage of saving), on the delivery of the 6000 motors, about \$6,450,000.

There would also be profits on spare parts, which are estimated at upwards of \$1,500,000 more, making an aggregate profit of about \$8,000,000. This would be exclusive of the allowances by way of depreciation.

The investment in real estate, buildings, machinery and equipment (exclusive of the special tools to be paid for by the Government, and the cost of testing and inspection facilities on which there is to be a depreciation allowance of 100 per cent) amounts to approximately \$7,150,000, of which about \$3,460,000 is the cost of machinery, tools and equipment (to July 31, 1918), on which the Government is to pay a depreciation allowance of 40 per cent, in addition to profits.

The entire paid-in capital of the company amounts to \$850,000. At the outset the company obtained on the credit of its officers about \$2,000,000, which served its purposes until it obtained the amounts needed for its plant, equipment and working capital, through advances by the Government.

It is pointed out very clearly that the company has provided an excellent plant for the manufacture of Liberty engines and that ultimately its profit, after paying taxes, will represent only an equity in its plant, without any assured business, as it has been devoted exclusively to Government work.

On the other hand, it may be said that there is a very liberal flat depreciation allowance on machinery, tools and equipment; that the plant is a permanent one, admirably designed for commercial work, and not merely for a temporary exigency, and that there is every prospect that it can be successfully utilized. It should also be said that from the standpoint of the Government it was free to make arrangements with existing plants, and the amount of the profits it should allow should be determined accordingly.

It is unnecessary to review the original contracts with the Nordyke & Marmon Co., which is very far behind in its deliveries, and with the General Motors Co. (Cadillac and Buick plants). The profit allowed per engine was the same as in the other contracts, but the contracts were for fewer engines, 3000 in the case of the Nordyke & Marmon Co. and 2000 in that of the General Motors Co. The Nordyke & Marmon Co. received advances of \$2,000,000. There were no advances to the General Motors Co.

The large percentage of the contractors' profits which will be taken by the Government in taxation is strongly emphasized, and, of course, what the Government takes back through taxation should fairly be taken into account. But the contemplated tax does not justify an extravagant scale of profits which, even after payment of taxes, would permit an excessive return upon the capital invested, in view of the greatly reduced risks of the contractor under the cost-plus contracts.

#### Revised Contracts for Liberty Engines

What has been said above relates to the original contracts for Liberty engines. During a recent period the contracts with the Lincoln Motor Co., the Packard Motor Car Co. and the Nordyke & Marmon Co. have been revised and put upon a fixed-price basis of \$4000 an engine.

The revised contract with the Lincoln Motor Co. is dated July 31, 1918. The former contract for 600 engines is cancelled and superseded and the new contract provides for 9000 U.S.-12s and necessary spare parts, with an option to the Government to require the production of 8000 additional engines and spare parts. The schedule of deliveries provided for in the new contract is as follows:

Previous to Aug. 1, 1918.....	1,000
August .....	750
September .....	1,000
October .....	1,500
November .....	1,500
December .....	1,500
January, 1919 .....	1,500
February .....	250

The price is \$4,000 an engine. The spare parts are to be delivered on a schedule basis corresponding to a total price of \$4,000 for a completed engine. The contract provides for payments by the Government, by way of amortization upon a basis of 100 per cent, of the actual cost of all testing and inspecting facilities provided by the contractor with the approval of the Government; for payment by the Government, by way of amortization upon a basis of 40 per cent, of the actual cost of the heat-treating building and equipment theretofore provided by the contractor; and payment by the Government, by way of amortization upon a basis of 40 per cent, of the actual cost of all machinery, tools and other items furnished by the contractor.

It is further agreed that in case the Government shall not order from the contractor the 8000 additional engines for which it has an option, or the contractor is prevented by termination of the contract from manufacturing and delivering

It is understood that it has been arranged that similar revised contracts on a fixed-price basis will be made with the Ford Motor Co. and the General Motors Co., but these had not yet been executed according to the latest information received.

The plant of the Wright Martin Aircraft Corporation at New Brunswick, New Jersey, is a conspicuous exception, few, if any, women being employed in the shops. The testimony

is that the local labor organization has taken a stand against the employment of women, and accordingly this has not been pushed by the management.

In the case of the Wright Martin Co., also it was apparent that a very large proportion of the employees were within the draft age as fixed by the Selective Service Law of May 18, 1917. The records show that on Aug. 15, 1918, 41.36 per cent, or 2,300 of the total number of employees (5560) at the New Brunswick plant were within the draft age, and of this number 15.83 per cent were in Class 1.

The report by the representatives of the Government at this plant states that the method used by the company for securing deferred classification and indefinite furloughs is as follows: When a man is employed who is in Class 1 of the draft, he is given a week to "make good." If he then is found to be efficient his foreman induces an application for deferred classification, and if this is refused by the District Board and the employee is called to camp, a request is made by the company to the personnel department of the Bureau of Aircraft Production for his return on indefinite furlough. Prior to August, 1918, the operations of the draft department of the company were open to serious criticisms and exhibited many irregularities.

In one case a man, whose duties were such that anyone who could handle a screw driver could do his work, was drafted and immediate steps were taken to have him returned as a "motor builder." Previous to his employment by the company he had been employed as a stock clerk by a manufacturer of gowns and he had no previous mechanical experience. In another case a man who was considered a deserter by his Local Board was finally located at the plant of the Wright Martin Co., where he was arrested and inducted into the Army.

Affidavits were immediately presented for his return from camp upon industrial grounds, and he was returned accordingly. One who had been a clerk of a carpet company, without mechanical experience, and who had a minor assembly job, was drafted and was returned on indefinite furlough as a necessary employee.

A former proof-reader, a former skating-instructor, and a former coupon-clerk, who had obtained employment at the Wright Martin plant were drafted and similarly returned. In other cases, men whose work was entirely clerical secured deferred classification on industrial grounds. Cases of this sort have now been brought to the attention of the Provost Marshal General.

It is stated by the Government representative that at present the draft department of the Wright Martin Co. is in competent hands, and it appears that its work is being done with a better regard for the interests of the Government.

#### Labor cost.

To establish the labor cost under cost-plus contracts it was necessary that there should be proper time records and suitable provision for the identification and check of employees as they entered and left the factory.

The opportunities for irregular pay-rolls, through laxity or connivance, are obvious. The conditions in this respect at the North Elmwood (Buffalo) plant of the Curtiss Aeroplane & Motor Corporation were especially bad. It was at this plant, (completed last fall) that the cost-plus work was done on the Bristol Fighter for the Army and the HS-1 seaplane for the Navy.\*

There is abundant testimony, with picturesque detail which can not be given here, to the effect that at the North Elmwood plant large numbers of employees were kept on the pay-rolls when they were not needed; through an utter lack of a decent system men and women were paid when they did not work; employees were able to leave factory without being detected and remain absent for hours while recorded as on duty; employees would ring one another's time cards; men who were without work enough to keep them busy during the day were employed over-time at increased rates; men were brought to the plant on Sundays when there was virtually nothing to do; and for many months there was such demoralization at this plant that it became the subject of contemptuous gossip among the employees and in the community.

One of the inspectors for the Navy testifies that as late as July he, with others, went through the plant at night on a tour of inspection, and not only were they able to go

from one end of the plant to another without being asked for their passes, but they found absurd conditions of idleness. In one room, "the foreman and three men (were) sprawled out on the floor," and, as he put it, there were "slackers from one end of the plant to another."

It is urged in palliation that the cancellation of the Spad order and the difficulties encountered in the development of the Bristol created a state of confusion, and that the management was constantly expecting to be able to get into production and felt it necessary to maintain an adequate force for this purpose. That the force was increased heavily at the North Elmwood plant during the early period, despite the fact that there were serious difficulties with the Bristol design and the company was not ready for large production, is beyond question.

In October, 1917, the average number of men working at the North Elmwood plant was 578. In December this was increased to 4142; in January, to 5970; in February, to 7029; there was a decrease of a few hundred in March and April, and an increase in May to 7557, and in June the average number at work was 9788.

To approximately sixty per cent of its capacity, this plant was either idle or working only in connection with the Bristol. The employment of men on a large scale when there was not work enough for them had much to do with the virtual destruction of the morale at the plant.

But whatever loss the Government has sustained in this way is not nearly as it might otherwise have been, by reason of the fact that a careful re-audit is in progress, which should be strictly prosecuted, and final settlement of payments awaits a satisfactory determination of actual outlays.

#### Employment of Alien Enemies

Among the regulations established by proclamation of the President on April 6, 1917, was the following:

An alien enemy shall not approach or be found within one-half of a mile of any Federal or State fort, camp, arsenal, aircraft station, Government or naval vessel, navy yard, factory, or workshop for the manufacture of munitions of war or of any products for the use of the army or navy.

Under the authority granted by the President to the Attorney General for the administration of the alien enemy regulations, the Department of Justice developed a permit system whereby alien enemies could obtain permits to be employed within a munitions factory, including one engaged in the manufacture of aircraft, within the half-mile zone.

The granting of such permits is entrusted to the United States Marshal of the district, who is authorized to issue them if he is satisfied that such action will be in no respect dangerous to the community or the United States. He is required before issuing a permit to confer with the special agent of the Department of Justice in the locality, to make a thorough investigation, to get the approval of the United States attorney or assistant United States attorney of the district, and also to obtain from the employer a certificate in writing to the effect that he desires to employ the applicant and that he is satisfied that such employment will not be to the injury of the community or the United States. Sponsors or bonds may be required and all such permits are revocable.

It will be observed that while the precaution has been taken to require suitable investigation by agents of the Government, the co-operation of the employer, who has special opportunities for obtaining accurate information, is expected. It is manifest that unless the Government is in possession of facts showing the inadvisability of the employment, the certificate of the employer in compliance with the regulations is likely to be most persuasive.

There is considerable difference in the practice of the various companies engaged in the manufacture of aircraft as to the employment of enemy aliens under these regulations. The following illustrations will suffice:

The Fisher Body Corp. states: "We do not employ any German aliens in our aeroplane factory or in our aeroplane divisions." On May 22, 1918, Mr. Kepperley, the Vice-President and General Manager of the Curtiss Company, gave instructions that under no circumstances should alien enemies be employed. Despite this instruction some alien enemies, who had previously been employed on permits, were retained in positions of importance. One of these, who began work for the Curtiss Company last fall, was put in charge of the milling machine department in the machine shop, and became assistant general foreman of the machine shop at the North Elmwood plant.

Another German subject (having a brother in the German navy) who began to work in the Curtiss plant in February 1917, became foreman in the welding department at the

\*The Curtiss Aeroplane & Motor Corp. has seven distinct plants: at Buffalo, the Churchill Street group (including the Churchill Street plant where training planes are made, and the plants at Niagara Street, Bradley Street and South Elmwood, making parts for Churchill Street); the Austin Street plant, doing Navy work, including contracts for the British Government; and the North Elmwood Avenue plant. At Hammondsport, New York, motors are manufactured exclusively. The work, except at the North Elmwood plant, is on a flat price basis.

North Elmwood plant and has been at work on all the tubing work and tail units for the Bristol Fighter as well as on the engine braces for the HS flying boats. Another, who had himself served one year in the German army and was discharged on account of wounds, was employed as tool maker at the Curtiss plant until sometime in June.

The Lincoln Motor Company states: "It is our endeavor to employ none but American citizens or friendly aliens. We are careful and using every precaution to not employ enemy aliens." The Nordyke & Marmon Company is equally careful. Their statement is: "At this date there are no alien enemies employed in the airplane engine division. A very few have been employed in this division from time to time but for only short periods at a time, as it has been our settled policy from the beginning of the war to keep alien enemy employees out of our Government departments, notwithstanding the individual man might be perfectly harmless. As fast as these men have been discovered they have been discharged."

About 200 enemy aliens (including Austrians and Hungarians) are employed by the Packard Motor Car Company. About 200 enemy aliens (not Germans, but Austrians and Hungarians) are employed at the plants of the Wright Martin Aircraft Corporation in New Brunswick and Newark. No enemy aliens are employed by that company at its Long Island City plant.

The Ford Motor Company has about 250 German aliens who are employed in departments dealing with Government work. 143 of these are in departments in which from 20 to 60 per cent of the work done is Government work; 35 are at the blast furnace, and 61 are at the ship-building plant which is doing Government work exclusively. These enemy aliens are working under special permit granted on the company's recommendation.

#### German Sympathizers

The serious risk that is taken in permitting men of known pro-German sympathies, whatever their citizenship, to work in aircraft plants in any important capacity is generally recognized. The opportunities are abundant for delays and interferences in production through the action or inaction of those controlling the progress of production.

It is the assumed sympathy with his nation which makes the employment of the German subject dangerous, and the danger may be quite as great in the case of one who, although not an enemy alien, is more friendly to Germany than to the United States.

There have been persistent rumors of pro-German sympathies on the part of employees of the Curtiss Company, but it has been impossible to ascertain to what extent, if any, the demoralization that until recently has existed at the North Elmwood plant of that company was due to any influence of this hostile description.

The conditions that existed naturally bred distrust which was reflected in common talk, but facts warranting a definite conclusion as to disloyalty on the part of employees in important positions are lacking.

In the case of the Ford Motor Company, one of the company's employees (who formerly had been in the Educational Department and had represented the American Protective League) testified as to his inquiry into cases of disloyalty. The reports obtained by him exhibit utterances of employees in antagonism to the Government, insulting references to the President, and praise of the Kaiser.

In an extreme case, in which the employee reviled and even threatened the President, there was a prosecution and a plea of guilty. The man was fined \$300, was released, and the testimony is that he resumed work in the Ford plant. The reports were numerous, and the employee who obtained them testified that there were about 200 employees whose loyalty was seriously open to question, but how many of these were employed in Government work he could not say.

So far as the Liberty engine was concerned, his investigation related to half a dozen cases in the Drafting Department in the Ford Company. In this department there was a serious situation which engaged the attention of the management. Its importance was manifest from the fact that the drafting department embraces the tool design and drafting room in which the drafting work upon the Liberty engine is done, and it is possible for one in that department to bring about delays, the causes of which, in view of the multiplicity of drawings involved, it would be difficult satisfactorily to trace.

This department was in charge of Carl Emde. There were repeated reports of pronounced pro-German utterances by Emde. A former employee, who had left the plant voluntarily and had later been found with plans and photographs of the plant, was a close friend of Emde's and had been employed in his department. This man, it is understood, has been

interned. While nothing conclusive could be established against Emde in relation to his work, the advisability of removing him from a position of such strategic importance was clear to some of the most important men in the management.

A conference was held on the subject at which Mr. Ford and the factory managers were present. According to the minutes of this conference reports were read "from various members of the drafting department who were in touch with the situation, and who felt that the department was practically a pro-German institution." Several conferees expressed the opinion that Emde should be removed, and one said that in his opinion "in the very nature of things Mr. Emde could not give us everything required to assist the Government of the United States." Mr. Ford, however, was opposed to that course and overruled his associates. Mr. Ford's position and his reasons are thus set forth in the minutes:

Mr. Ford deliberated and stated that he had heard numerous rumors, but in speaking of all he had heard there had not been one thing shown him which would make him change the present head of the drafting department. He felt that it was a time of sacrifice—that in the next few years every man would be called upon to make some sort of sacrifice, and that possibly Mr. Emde, German born, was making his sacrifice now when making drawings for the Liberty motor to be used ultimately against Germany.

This statement of attitude is sufficiently expressive and requires no comment. The proposed removal did not take place. There has been a laxity at the Ford plant with respect to those of German sympathies which is not at all compatible with the interests of the Government. In deference to Mr. Ford's view, those in direct charge of production, who were alive to the situation, have had to pursue a policy of constant watchfulness and supervision instead of being free to take the precautions which the exigency demanded.

#### MATERIALS

The leading causes of waste in material were engineering changes and faulty workmanship. As material was rendered useless it was scrapped, and there is no little evidence of a lack of care in securing salvage.

For the losses due exclusively to changes in design after authorized production had begun the manufacturers cannot be regarded as responsible; and these losses, while they cannot be accurately computed, are undoubtedly heavy.

Their extent, of course, is proportioned to the stage of production reached when changes were directed; and with respect to the service planes the history of production at the Dayton Wright Airplane Co., the Fisher Body Corp. and the Standard Aircraft Corp. discloses the same conditions varying only in degree as to the delay and waste caused by repeated changes.

With respect to the intelligence and efficiency of the inspection, and the extent to which rejections have been on sound grounds, there are naturally differences of opinion and complaints and counter-complaints the basis for which cannot be satisfactorily determined. It is to be noted that the rejection of spruce which has gone into production has reached a high percentage. Even at one of the best plants the Government representative puts the percentage as high as sixty per cent after allowing for salvage, and at other plants the percentage of rejections was probably higher.

A poor industrial organization such as existed at the plants of the Standard Aircraft Corp. and the Curtiss Company (North Elmwood plant) did not favor economical production, and in the case of the former company conditions were aggravated, as already pointed out, by the assignment to that company of a large number of small orders for varied work.

At the North Elmwood plant of the Curtiss Company the waste which was incident to delay and changes was vastly increased by irregular practices. Thus, in order to keep men busy who apparently had no proper work to do, there was excessive production of parts.

A production order might be for 500 parts but the actual production might run to 5000 or even more of these parts until this unwarranted conduct was discovered and stopped. There is instance after instance of excessive production which served to increase the size of the scrap heap when a change made the parts useless.

Again, at this plant when a change would lead to an order stopping the production of parts, production often would continue despite the order.

As an illustration, one witness testified that he had personally given a stop order on certain metal parts and found two weeks after, in going through the metal shop, that they were still making the parts, sending them through the various operations and working over-time on their production.

During periods of idleness employees devoted their time to making clocks and toys out of the materials at their com-

mand in the factory. Excess material was scattered about the factory without a proper record being kept of it. And it appears that material would be sent to the scrap heap instead of being properly salvaged, in order to cover mistakes.

There was also a lack, at the Curtiss plant, of proper records of material. In the case of steel stores there was confusion between what had been supplied for the Army work, for the Navy work, and for the Curtiss fixed-price work so that accurate accounting based on the ledger entries was wholly impossible.

And in addition to other manifest delinquencies, there was an absence of proper plant protection. The situation of the company in view of its experience with both the Spad and Bristol orders was undoubtedly a difficult one, but the lack of competent industrial administration is too clear to admit of dispute and has freely been confessed.

There has been little evidence at the North Elmwood plant of the exercise of the broad powers of the Government to prevent these abuses, and the fact that conditions were permitted to continue reveals the failure of the representatives of the Signal Corps to take proper steps for the protection of the Government's interest.

There was, however, such an absence of system on the part of the company in the keeping track of parts, and so many changes in the persons employed, that, while there is abundance of general testimony, it is practically impossible at this time to trace particular instances of dereliction to individuals in order with suitable particularity to support definite charges.

The divided responsibility which resulted in giving the design of the Bristol so largely into the control of the representatives of the Curtiss Company was also a source of embarrassment, and the extreme haste to make up for lost time added to the confusion. Conditions through the winter and early spring were chaotic and the improvement that has been made since that time has been unnecessarily slow. It is fair to say, however, that recently there have been changes which promise a needed betterment in the industrial organization.

So far as the loss of the Government in connection with the Bristol is concerned the payments already made to the Curtiss Company, according to the Government accounts, amount to upwards of \$2,000,000 exclusive of advances, and as already stated, the Government has estimated that the loss, including claims growing out of the cancellation may reach \$6,500,000 (*ante*, p. 16.)

The Government, however, has a margin of security by reason of deferred payments and a re-audit is in progress which must be completed before a final settlement is made for materials furnished. The loose methods employed by the company should be taken into consideration and a final settlement should be reached only upon satisfactory proof of proper outlays.

#### Overhead Charges

In the course of production payments have been made on account of overhead charges upon the basis of a general estimate; that is, by taking a percentage of other outlays, which seems to be justified in the experience of the plant, as representing the overhead expense. The overhead expense embraces general administrative outlays, including executive salaries; and the theory of the cost-plus contract is that the Government pays the expense of superintendence as a part of the cost.

It is, of course, important that fair salaries should be allowed, and all exorbitant demands rejected. Reference has already been made to the salaries paid to the executive officers of the Dayton Wright Airplane Co., who were at the same time the stockholders in a close corporation and divided their time with other companies from which they received high salaries.

There appears to be no justification for even the temporary allowances to the Talbotts and Kettering of annual salaries aggregating \$100,000, and the explanation furnished that the "relations with the contractor were somewhat delicate at first, and, moreover the company was in crying need of cash, and any withholding of amounts due was sure to create much friction," is not convincing; inasmuch as the individuals, and not the company, got the money, and it is difficult to see how "friction" in this matter could have injured the Government.

It is also stated that when the salaries were allowed in the fall of 1917, dating from Aug. 1, 1917, it was felt that it was a matter of considerable importance "that would have to be passed by Colonel Deeds who was in charge of the Equipment Division," but Colonel Deeds testifies that he knew nothing of the salaries that were paid to these officers.

It should be said, however, that these allowances, under

the terms of the contract, should be regarded as tentative, and that it is within the authority of the finance department in its final settlement to adjust the matter on a fair basis. And that is the position of that department.

Even more extraordinary was the salary paid by the Standard Company to its president, Mr. Mingle, at the rate of \$63,000 a year, which is sought to be charged as a part of the cost of operations. This, however, has not been allowed.

The question what would be a proper allowance has been under consideration. Several vouchers have been passed which represent merely payments on account, or payments "subject to adjustment," and it is stated that the amount of Mr. Mingle's salary thus far actually allowed is at the rate of \$15,000 a year.

The adjustments of overhead expense as are the other payments on vouchers under the cost-plus contracts, are subject to a revision of accounts and it is within the power of the finance division in the ultimate adjustment of cost in accordance with the terms of the contract to protect the Government against any claims on the part of the contractors which may be found to be unjustified.

#### TENTH. SPECIAL MATTERS

##### 1. Purchase of the Plant of the General Vehicle Company

In November, 1917, the Government purchased the plant of the General Vehicle Company at Long Island City, New York, for \$1,527,568. The purchase embraced all the real estate, building and machinery constituting the plant, and all other assets, except that patents (other than those relating to internal combustion rotary aircraft engines) franchises, good will, cash, bills and accounts receivable, specified securities and all inventory assets not acquired and used in connection with the manufacture of Gnome engines, were retained by the General Vehicle Company.

The company also agreed to release for the use of the Government its administrative and manufacturing organization so that the Government might take over the plant property and organization as an active manufacturing establishment in full readiness for production.

Upon a physical valuation and inspection of the books of the company by Government appraisers and accountants showing that the price was a fair one on the basis of prices previous to the war, and upon an opinion of the Judge-Advocate General as to the legality of the purchase and as to the propriety of the form of contract, the purchase was recommended by the Aircraft Board.

The advisability of the purchase, however, was doubted at the time by officers of the Government. It appears that at the outset, in formulating the aircraft program, it was supposed that the Gnome rotary engine would be a factor of some importance, and a small order for Monosoupape motors was placed with the General Vehicle Company, but in view of doubts as to the planes to be built, with which such engines would be used, further orders were not placed.

Later, on word from overseas that Gnome rotary engines should be put into production, there were negotiations with the General Motors Corporation looking to the acquisition of the General Vehicle plant and the manufacture of these engines in large quantities. Before the matter was closed, the instructions from abroad were changed and the proposed transaction was abandoned.

The considerations underlying the purchase are stated in the recitals of the Aircraft Board in the resolution adopted at its meeting of Oct. 19, 1917. It was stated that advices from France indicated a doubt as to the future demand for rotary engines in aviation, but that nevertheless these engines would be used to a greater or less extent for a considerable period to come; that it was desirable that "the technique of manufacture of rotary engines should in any event be studied and developed in the United States in case of need;" that the General Vehicle Company had "the only plant and organization of substantial size in the United States, equipped and organized with the necessary facilities and experience for the manufacture of such engines;" and that the present and future demand for rotary engines was "not sufficient in amount or sufficiently continuous to justify a manufacturer in the maintenance of a plant and organization adequate for a prompt supply of such engines and for the proper study and development of the technique of that type of engine."

In a previous part of this report (*ante*, p. 98), reference has been made to the opinion of the Joint Army and Navy Technical Board, given on Nov. 16, 1917, that in the program for the coming year rotary engines should be considered of secondary importance, but that it was deemed desirable that the art of building rotary engines should be retained in the United States and that for this purpose the organization skilled in rotary engine production should be preserved.

While it was thought that an order which had been given to the Union Switch and Signal Company for 2500 80 hp. LeRhones was larger than was necessary to preserve the art, it was further recommended that steps be taken to maintain the possibilities of production of the 160 hp. Gnome engine. The resolution of the Joint Army and Navy Technical Board did not in terms approve the purchase of the General Vehicle Company's plant, nor did it express opposition in any definite way.

The actual necessity of the purchase of the General Vehicle Company's plant is not apparent. As soon as the Government made the purchase, a corporation called the Aeronautical Engine Company, with a nominal capital, was incorporated for the purpose of building Gnome engines at the plant and contracts were made for the manufacture of small quantities at cost, without profit. This, however, did not continue long.

It was found that the Union Switch and Signal Company had mastered the art of making LeRhone engines, and although these were of a different type, it seemed that the necessity of keeping the organization in existence at the plant purchased from the General Vehicle Company soon ceased, or was very much minimized. In April last, it was proposed that the plant at Long Island City be leased to the Wright-Martin Company for the manufacture of the 300 hp. Hispano-Suiza engines, and an arrangement for this purpose was made soon thereafter, one of the reasons being stated to be "the practical abandonment of the manufacture of Gnome motors."

At the time of the purchase of this plant by the Government, the General Vehicle Company had outstanding notes amounting to \$1,530,000, which were held by the Peerless Truck and Motor Corporation. The purchase price paid by the Government was substantially equivalent to the amount of these notes and thus provided for their retirement.

The purchase, however, was made on the basis of the value of assets, and whatever difference of opinion there may be as to the advisability of the purchase, there are no facts warranting the conclusion that it was not made in good faith or that the amount paid was in excess of the fair value of the property acquired.

## 2. Mahogany Manufacturers and Importers Association

True mahogany is a desirable wood (ranking in the opinion of the Government's production engineers next to Black Walnut) for the making of propellers for service or combat airplanes. To meet this demand, contracts had been made for Mahogany in the fall of 1917, but with only one responsible corporation, that is, Lewis Thompson and Company. A contract with one of the companies selected was cancelled because it was apparently without financial resources and could not provide a bond, and in the case of another contractor no deliveries were made.

In the beginning of January, 1918, it appeared that there was a serious shortage in the Government's supply of wood for service-plane propellers and through the War Trade Board the leading Mahogany manufacturers of the United States were invited to a conference in Washington.

This conference was held on Jan. 21, and at that time, or in the later conferences, the following corporations and firms were represented: Huddleston-Marsh Mahogany Company, Ichabod T. Williams & Sons, George D. Emery Company (said to be closely affiliated with I. T. Williams & Sons) and the Astoria Veneer Mills and Dock Company of New York; Palmer, Parker and Company, of Boston; Lewis Thompson and Company, and S. B. Vrooman Company, of Philadelphia; Freiberg Lumber Company, of Cincinnati; C. C. Mengel and Brother Company, of Louisville; Talge Mahogany Company, of Indianapolis; C. L. Willey Company, of Chicago, and the Otis Manufacturing Company, of New Orleans.

At the first conference the manufacturers were notified of the Government requirements for propeller stock, their co-operation was sought, and they were asked to advise the Government of the quantity which each could furnish, and the price. The representatives of the War Trade Board suggested the advisability of an organization of the manufacturers to secure effective co-operation with the Government, and accordingly an association of the manufacturers was at once formed which appointed a War Committee composed of A. S. Williams, of the Astoria Veneer Mills and Dock Company, C. H. Thompson, of Lewis Thompson and Company, F. C. Leary, of Ichabod T. Williams and Sons, F. G. Otis, of the Otis Manufacturing Company, and J. C. Wickliffe, of the C. C. Mengel and Brother Company.

The committee met at once and passed a resolution expressing the opinion that the best interests of the Government would be served by the purchase by the Government "of all Central American mahogany logs now under contract with the members of the association at a price to be agreed upon; the

Government to arrange transportation of said logs; the manufacturing of the logs into lumber to be done by the mills represented by this association at a price to be agreed upon."

At the same meeting, the officers of the association were elected: Thomas Williams, of Ichabod T. Williams & Sons, president; R. S. Huddleston, of the Huddleston-Marsh Mahogany Company, treasurer, and Charles H. Thompson, of Lewis Thompson and Company, secretary.

This proposition was rejected by the representatives of the Signal Corps, for reasons stated at length, which were in substance that it was deemed inadvisable that the Government should arrange for the purchase of logs directly from the loggers in Central America and Mexico in view of the unfamiliarity of the Signal Corps with the logging business, or that the Government should take over existing contracts for purchases of logs on account of the complications that might arise, or that the Government should become directly involved in log purchases.

Recognizing the difficulties in the disposal of a largely increased quantity of lumber, the representatives of the Signal Corps felt disposed to pay "a higher price than pre-war or existing prices for propeller stock" in order that the mahogany manufacturers might offset any loss due to the low market value of rejected material.

It was then recommended by the Signal Corps that the manufacturers should make a proposition as to the price to be paid for propeller stock, and it was stated for the manufacturers that they could not quote prices on the basis of the existing Signal Corps specifications, as these were too restrictive as to the grade to be selected and permitted the Signal Corps to accept or reject the material based upon the judgment of the inspector.

It was finally suggested that the manufacturers should submit a proposition based on what are called 'National Hardwood Inspection' rules (that is, the rules of the National Hardwood Lumber Association) quoting a separate price on "first and seconds, selects and No. 1 common."

Discussions continued between the War Committee of the Association and representatives of the Government, among the latter being Lieutenant Ryerson who was in charge of propeller parts in the Plane Production Section, Joseph S. Otis (who, as the result of a disagreement, had recently severed his connection with the Otis Manufacturing Company and had offered his services to the Government as a mahogany expert, and representatives of the Lumber Committee of the Council of National Defense.

At the meeting on January 23rd, according to Lieutenant Ryerson's report, the War Committee of the Association suggested prices for propeller mahogany according to 'National Hardwood Inspection' rules as follows: firsts and seconds, \$350 per M feet; selects, \$320; No. 1 common, \$270.

After these figures were submitted a discussion of costs followed in which Joseph S. Otis, representing the Government, and J. C. Wickliffe, representing C. C. Mengel and Brother Company, gave their respective estimates of costs. Mr. Otis' estimate was considerably lower than the other, and was contested by Mr. Wickliffe.

The question of specifications was again discussed and the Signal Corp representatives stated that it would be impossible to place orders on the basis of 'National Hardwood Inspection' rules, which permitted widths considerably less than those required for propeller stock.

After further parley, Lieutenant Ryerson stated that it would be preferable to negotiate with the various manufacturers and importers individually for the purchase of such mahogany as they were in a position to offer. It was considered that if negotiations could not be brought to a close on the basis of the prices quoted that it might be desirable for the Government to fix a price for the purchase of propeller stock and agree to provide in its contracts that after partial performance there should be an audit of costs and a readjustment of prices upon a fair basis.

After the negotiations had thus proceeded for several days, the manufacturers submitted to the officials of the Signal Corps the opinion that Joseph S. Otis was not competent to advise the Signal Corps with respect to mahogany costs and suggested that action should be taken by which some one should be put in charge of the purchases of mahogany for the Government "who could develop the actual facts and be fair to the industry." Joseph S. Otis left the Signal Corps on January 29th.

On January 31st Henry Lockhart, Jr., was placed in charge of the 'Materials Department, Foreign and United States' which had the duty of procuring the materials necessary for the production of airplanes, with the exception of motors and instruments.

About February 5th, Henry K. S. Williams, who had formerly been in the lumber business as a member of the

firm of Ichabod T. Williams & Sons (being a brother of Thomas Williams of that firm) but had retired several years before, was put at the head of the Hardwoods Section, which was a sub-division of the Materials Department and had charge of the orders for woods required for propeller stock.

Shortly after, on February 25th, J. C. Wickliffe, who had been for ten years Secretary of the C. C. Mengel and Brother Company of Louisville, and had been active as a member of the War Committee of the Mahogany Manufacturers and Importers Association, entered the service of the Government as assistant to H. K. S. Williams in the Hardwoods Section.

The suggestion that he should take this position was made about the middle of February in a conversation between H. K. S. Williams and Mr. Mengel when the latter was asked if he could spare Mr. Wickliffe from his organization.

On March 4, 1918, J. Edward McCullough, who had been superintendent at the mill of the George D. Emery Company, one of the members of the Mahogany Manufacturers and Importers Association, was made district inspector of mahogany as well as other woods in the New York district, embracing Boston, New York, Philadelphia and New Orleans.

He was selected by S. B. Vrooman, Jr., who about February 10th was given general charge of the inspection of all propeller lumber throughout the country. Prior to his connection with the Government (he started as an inspector in December, 1917) S. B. Vrooman, Jr., had been in the service of the S. B. Vrooman Company, also one of the members of the Mahogany Manufacturers and Importers Association; he was, and has continued to be, during his service with the Government, one of the stockholders of that corporation (*ante*, p. 68).

Mr. Wickliffe, during his connection with the C. C. Mengel & Brother Company, had owned five shares of its preferred stock, which he disposed of some years ago; his wife owned five shares of the common stock, which were sold when he entered the Government service.

His salary as secretary of the Mengel Company had been \$500 a month; his compensation from the Government was at the rate of \$4000 a year. When it was suggested that he should become connected with the Government, he said that he could not afford it, but he was informed that Mr. Mengel had offered to continue his salary "as a donation to the Government during the war."

Mr. Wickliffe replied that he did not like the arrangement, would not accept it without Mr. Lockhart's approval, and in any event would not consent to be paid more than enough to defray the living expenses of himself and his family. Mr. Wickliffe was paid by the Mengel Company, in addition to his salary from the Government, \$250 on March 25th, \$250 on March 29th, and \$250 on April 15th, a total of \$750.

This was subsequently adjusted on the basis of \$350 for the period to April 1st and \$400 was returned by Mr. Wickliffe to the Mengel Company. This was explained in Mr. Wickliffe's letter to Mr. Mengel as follows:

628 Lexington Place, Washington,  
Apl. 13th, 1918.

Mr. C. R. Mengel,  
Pres., C. C. Mengel & Bro. Co.,  
Louisville, Ky.

Dear Mr. Mengel:

The Signal Corps having fixed the salary I am to receive from them at the highest figure they can pay of \$4,000.00 per annum, I want to let you know that I think it necessary now that you reduce the amount that you are remitting me monthly to \$350.00 per month. As near as I can estimate it, I can get by on Washington living expenses and do such official entertaining as I shall have to do on the sum of these two amounts. If I find that I cannot, I shall frankly let you know the condition. But I feel that living here and doing the necessary at my present job on this figure is about the equivalent of the salary I had when I was with you in Louisville. Therefore, kindly give the necessary instructions to have the remittance cut down.

Again thanking you and the company through you, I am,  
Very truly yours,

J. C. Wickliffe.

The arrangement with C. C. Mengel and Brother Company was approved by H. K. S. Williams in his letter of April 24, 1918, as follows:

Washington, D. C., April 24, 1918.  
From: Office of the Chief Signal Officer.  
To: C. C. Mengel & Brother Co., Louisville, Ky.  
Subject: Services.

1. In line with the request of your president, Mr. C. R. Mengel, this Section desires to give you this letter stating that at the time it asked you for the services of your former secretary, Mr. J. C. Wickliffe, it was fully understood by it that you or the Mahogany Industry would pay him an amount of money per month over and above the salary the Signal Corps was authorized to pay him, so that the sum of these two would be sufficient to cover his and his family's expenses during his service with the Signal Corps. This was done with the full knowledge of Mr. Henry Lockhart, Jr., head of the Materials Department, because of the fact that the Hardwood Section needed his services, and in view of the further

fact that your offer to do this was made with the distinct understanding that he should sever all connection with your company and with the mahogany industry and assume his new duties, of course, entirely as a member of the Signal Corps organization. This Section would also set forth the fact that your offer was specifically asked by you to be considered in the light of a donation to the war.

By direction of the Acting Chief Signal Officer.

Henry Lockhart, Jr.

Materials Department, Foreign and United States,

By H. K. S. Williams,  
Hardwood Section.

The salary which S. B. Vrooman, Jr., had received from the S. B. Vrooman Company has been continued by that Company, and when J. Edward McCullough entered the service of the Government, the George D. Emery Company paid until the arrangement mentioned below, the difference between his Government pay and his former compensation from the company.

It was soon arranged that the Mahogany Manufacturers and Importers' Association should assume the payment of the additional compensation to Mr. Wickliffe and to Mr. McCullough. Accordingly, for the period beginning with April this compensation was paid to both in checks from Mr. Huddleston, the Treasurer of the Association. The amounts were raised by voluntary contributions of various members of the Association. The minutes of the Association show the following action in the matter:

The matter of the difference in compensation between the amount paid by the Government for services to J. C. Wickliffe and to Mr. McCullough and the amount of compensation previously received was discussed. The following resolution was then presented, duly seconded and adopted by the affirmative vote of all present:

Resolved, That such excess compensation be paid by the various members of the association in the form of an annual subscription, which is made up by various amounts subscribed by the mahogany firms, amounting in total to fifty-seven hundred (\$5,700) dollars.

The motion was duly made, seconded and carried by the affirmative vote of all present, that a copy of this resolution be sent to Mr. H. K. S. Williams.

Mr. Wickliffe testifies that this arrangement was made "because it was felt that it was not right for any one individual firm to pay it all." Mr. Huddleston testifies that it was "purely a question of co-operation with Mr. Mengel." Early in May there was correspondence between H. K. S. Williams and Mr. Huddleston, the treasurer of the Mahogany Association, in which a letter in the following form, addressed by Mr. Huddleston to Mr. Wickliffe was first submitted to H. K. S. Williams and approved by him:

347 Madison Avenue, New York, N. Y.  
May 10, 1918.

Mr. J. C. Wickliffe,

Materials Department, Foreign and United States,  
Hardwood Section, Washington, D. C.

My dear Mr. Wickliffe:

A few days ago when the heads of the various mahogany importing and manufacturing concerns met for general discussion, attention was called to the fact that by virtue of your recent appointment as assistant to Mr. H. K. S. Williams, your annual income had been cut something in excess of fifty per cent.

After a general discussion it was agreed that it would not be fair that you stand alone the burden imposed on you by your services to the Government in this particular department, therefore, it was mutually agreed that the various mahogany firms, feeling as patriotic as you have demonstrated yourself to be, will make up the difference between your former income and what you are now receiving from the Government, provided such an act would meet with the approval of Mr. H. K. S. Williams, the head of your department.

I am pleased to advise you that I am today in receipt of a letter from Mr. H. K. S. Williams, approving of this transaction: so acting in the capacity of treasurer, I will mail you each month a check for \$350 beginning the month of April, which I am informed will make up the difference in your salary.

A similar letter was written, with the approval of H. K. S. Williams, to Mr. McCullough. Mr. McCullough was paid by the Association for April, May, June and July, at the rate of \$91.67 a month. He returned to his former employment early in August. In the case of Mr. Wickliffe, the arrangement continued until it was officially disapproved on August 20, 1918, by Mr. J. Gilmore Fletcher, on behalf of the Bureau of Aircraft Production, in the following letter:

War Department, Bureau of Aircraft Production,  
Washington, Aug. 20, 1918.

Mr. J. C. Wickliffe,

Hardwood Section,

119 D Street, N. E., Washington, D. C.

My dear Mr. Wickliffe:

In view of the fact that the Government looks with disfavor upon your receiving from the Mahogany Manufacturers and Importers Association your present monthly remittance, which I shall refer to here as a salary of \$350 per month, I deem it best, and hereby request, that you immediately refuse to accept any further payments from that source, or any other source which comes in direct line with your duties in the Hardwood Section, the Raw Materials Department, Division of Aircraft Procurement, Bureau of Aircraft Production.

I shall at once take the proper steps to have the salary now paid by the Government, namely, \$4,000 per year, increased to \$8,200 per year, and shall make every effort to expedite a decision on the point of allowing you this increase.

Yours very truly,

J. GILMORE FLETCHER,  
Chief of Aircraft Procurement.

Mr. Wickliffe immediately requested Mr. Huddleston to discontinue the payments, and accordingly there has been no payment of additional compensation since the payment for the month of July.

Early in February, 1918, arrangements were made with some of the manufacturers for the taking over of certain mahogany which had been under contract for delivery to British merchants, but the amount was relatively small. After H. K. S. Williams took charge of the Hardwood Section, and also after J. C. Wickliffe became his assistant, negotiations were continued with the manufacturers composing the Mahogany Manufacturers and Importers Association for the purchase by the Government of mahogany in large quantity for propeller stock. On the appointment of H. K. S. Williams, his brother, Thomas Williams (of Ichabod T. Williams and Sons) had resigned as president of the Association, and C. R. Mengel was elected in his stead.

On February 14, 1918, new specifications had been adopted by the Signal Corps (No. 15,028-A), modifying and liberalizing the prior specifications which had been adopted in the previous December. At about the same time (February 13th) the manufacturers had submitted two proposals, one under the Signal Corps specifications (No. 15,028-A) at \$400 per M feet for firsts, seconds and selects, and \$320 per M feet for lower grades, f.o.b. cars eastern mills (with corresponding prices for other points according to estimated freight rates), and another proposal under the 'National Hardwood' rules for specified sizes at \$350 per M feet for firsts, seconds and selects, and \$280 per M feet for No. 1 common, f.o.b. cars eastern mills. These had been refused. The important difference was with respect to the inspection.

In this situation, a conference was held on March 6th between the manufacturers and H. K. S. Williams, J. C. Wickliffe, and S. B. Vrooman, Jr., representing the Government.

The minutes of this conference show that H. K. S. Williams opened the meeting with the announcement that "it was the purpose of the Signal Corps to grant as liberal an inspection as could be given consistent, of course, with the principle that no lumber could be taken that would not make propeller blades."

After a discussion of the matter of utilizing lumber which showed scattered pin-worm holes, and the opinion having been expressed by Mr. Vrooman that such stock could be used where it did not affect the strength of the board, Mr. Williams stated that he would endeavor to have the Inspection Department accept such lumber. This, as Mr. Wickliffe, testifies, was accomplished.

The minutes show that Mr. Williams "stated that Mr. Vrooman is going to be in charge of the inspection all over the country; that he will appoint various men to do the inspecting at the various mills, and shall show them what is to be done."

Mr. Williams further stated that his object in having Mr. Vrooman at this conference was that "the interpretation of the Signal Corps specifications might be as easy as such interpretation could be made consistent with the principle of accepting only propeller material, but that the Government might get all such material that it could get."

Mr. Williams then requested that each manufacturer advise him of the cost of its logs placed alongside steamer at Central American and Mexican loading points, and these estimates were given.

Another conference was held on the same day between the manufacturers and H. K. S. Williams and J. C. Wickliffe, representing the Government, at which, after considerable discussion, Mr. Williams stated that he would recommend the payment by the Government of the following scale of prices on Mexican and Central American mahogany propeller stock under Signal Corps specifications No. 15,028-A, as follows: \$350 per M feet for first, seconds and selects, and \$280 for lower grades, f.o.b. eastern and middle western points, and \$330 and \$265, respectively, at New Orleans; and the same schedule of prices was stated for African mahogany f.o.b. eastern and middle western points. At these conferences Mr. Wickliffe was in attendance as Mr. Williams' adviser.

He reviewed the manufacturers' estimates and made calculations for Mr. Williams as to costs, and in view of his extensive experience there can be no doubt that considerable reliance was placed upon his opinion and advice. The terms of the contracts were virtually settled, in accordance with Mr. Williams' proposal, at the second conference on March 6th, and these terms were subsequently approved by Mr. Lockhart. The formal contracts were not made until sometime later. On March 26th the Aircraft Board recommended the execution of the contracts, on the above terms for the following quantities:

#### For African mahogany:

	Minimum	Maximum
Astoria Veneer Mills Dock Co.....	2,000,000	3,500,000
I. T. Williams & Sons.....	500,000	1,500,000
Palmer & Parker Co.....	600,000	1,500,000
C. C. Mengel & Bro. Co.....	2,800,000*	2,800,000
Taige Mahogany Co.....	2,130,000	2,450,000

#### For Central American and Mexican mahogany:

	Minimum	Maximum
Huddleston & Marsh Mahogany Co.....	1,750,000	3,000,000
Astoria Veneer Mills & Dock Co.....	1,500,000	2,500,000
Lewis Thompson & Co.....	1,500,000	2,000,000
Otis Manufacturing Co.....	1,000,000	2,000,000
Frieberg Lumber Co.....	500,000	1,250,000
I. T. Williams & Sons.....	750,000	2,000,000
Palmer & Parker Co.....	300,000	750,000
C. C. Mengel & Brother.....	2,800,000	2,800,000

\*Amended to read 1,700,000 minimum.

On April 16 the Aircraft Board recommended the making of a contract with the S. B. Vrooman Company for Central American or Mexican mahogany, 500,000 ft., minimum, and 1,500,000 maximum.

It is hardly necessary to say that it was a gross impropriety for corporations or firms, either individually or collectively, to pay additional compensation to an employee of the Government, and for the employee to receive such compensation, for services in relation to contracts and transactions in which the corporations or firms were directly and pecuniarily interested.

It is not found, however, that there is any statute making this a criminal offense unless it is a case within the statute against bribery, or proves to be part of a fraudulent scheme to take advantage of the Government, or part of an endeavor to induce a violation of law.

The act of March 3, 1917 (*ante*, p. 25) making it a crime to pay additional compensation to an employee of the Government, or for an employee to receive such additional compensation, only applies to such contributions after July 1, 1919.

The occasion of this statute, it is understood, was criticism of payments of additional compensation made to experts in the employ of the Government, where, however, the employee in the Government service was not acting in matters in which the person or corporation contributing had any pecuniary interest or motive of gain.

Contributions for the support of those who have made sacrifices in undertaking war work for the Government are doubtless made in many instances, but there is no analogy between cases of this general description and payments of additional compensation to employees of the Government by those having direct pecuniary interest in the transactions in which the employee acts as the Government's agent.

But under the statute against bribery (Criminal Code, Secs. 39, 117) it must be proved that the payment was made or received with intent to influence the decision or action of the representative of the Government on a question which may be brought before him in his official capacity or in his place of trust or profit, or to influence him to commit, aid, collude in or allow a fraud, or to make opportunity for the commission of a fraud, on the United States, or to induce the employee to do or omit to do an act in violation of his lawful duty.

Whether in the present case, in the circumstances disclosed, any charge of this sort could properly be made would largely depend upon the question whether the terms and prices secured by the mahogany manufacturers were fair and reasonable, or could be deemed excessive and the result of improper influence. In view of the intimate relation of the representatives of the Government who took part in the negotiations to the manufacturers it is obviously appropriate that there should be a fair and impartial examination of the transactions by a body competent to make a survey and determination of questions of costs and profits.

Testimony has been given in the present inquiry tending to show that the prices were high. Lower prices under prior orders and offers are referred to. On the other hand, the manufacturers urge that in view of the peculiar conditions of the industry, the difficulties attending the procurement of logs, and the risks taken by reason of the small percentage of lumber suitable for propeller material, the prices and terms were in all respects fair; that Mr. Williams, Mr. Wickliffe, Mr. Vrooman and Mr. McCullough took their positions simply because of the necessity of having men in their respective places who were qualified by experience, and that throughout the transactions all the persons concerned have been moved solely by the desire to serve the Government.

It was manifestly impossible in the course of the present inquiry to make such a survey of the mahogany industry as to reach a satisfactory conclusion with respect to the cost of producing the required mahogany and as to the fairness

of prices and terms. This sort of investigation would require special facilities of the kind which are at the command of the Federal Trade Commission, and through its instrumentality it is believed that such a survey of the industry and a determination of fair costs and profits can be made. Upon its report as to the cost of producing the required mahogany it can readily be decided whether there is ground for prosecution by reason of the transactions which have been disclosed in this inquiry.

#### African Mahogany

Attention should be called to the fact that the contracts with the mahogany manufacturers called for considerable quantities of African mahogany. It appears that prior to the war large importations of mahogany had been made from Africa. Thus, in 1914, out of total importations of mahogany logs of 70,914,000 ft., there were 31,177,000 ft. of African mahogany. At the first conference with the Government representatives, on Jan. 21, 1918, as the minutes kept by these representatives show, Mr. Mengel had suggested the increased supply which could be obtained from Africa, and Mr. Leary (of Ichabod T. Williams & Sons) "described his efforts to induce the Signal Corps to use African mahogany." Offers of African mahogany were made in proposals by several of the mahogany manufacturers under date of March 6. Thus, in the proposal then sent to the Signal Corps by C. C. Mengel and Brother Company it was stated that his company had at Axim, Africa (on the Gold Coast) "awaiting steamers, 3,000,000 ft. of sound, fresh logs"; and also at Axim, "now in streams tributary to it, and available for the June rains, 4,000,000 ft.; and these logs, located as they are, and from the best information we have, pretty nearly sure to be delivered at Axim on the June rains, as they were put in pretty good, safe streams by our own men, in our own employ, and paid by us, and put in streams selected so that they would come out on light water."

The advisability of using African mahogany as propeller material, however, was far from clear. It was not regarded as within the original specifications, but the modified specifications adopted on Feb. 14, 1918 (No. 15,028-A) stated that African mahogany (*Khaya senegalensis mahogani*) was approved by the Signal Corps.

Despite this statement, the question was not regarded as settled. On Feb. 13, 1918, H. S. Betts, Acting Assistant Forester, in reply to a letter of Captain Oakleaf of the Signal Corps, stated that it was "undoubtedly true that the term 'African mahogany,' without further specifying as to kind of wood, would include several species which are inferior in quality for propellers"; but after referring to various tests, quoted a report from the Forest Products Laboratory that the African mahogany was "practically the equal of the General American species, and could be substituted satisfactorily for the latter."

On Feb. 26, H. K. S. Williams wrote to Major Gray of the Production Engineering Department that he was "anxiously awaiting information as to whether African mahogany has been approved for use for the manufacture of propellers for battle and bombing aeroplanes." He said that he had reported the matter a number of times to his superiors, and had been told to communicate with Major Gray, and after referring to communications he had received on the subject he asked for a reply by telegraph. On March 1 the Production Engineering Department telegraphed its answer to H. K. S. Williams as follows:

This department is not favorably disposed towards African mahogany for combat propellers and does not see why it should be shipped here and then back to Europe. Can not arrangements be made to have walnut for English diverted to our propeller manufacturers and to ship African mahogany to England? There is much poor African mahogany on American market. In any event for safe use African mahogany would have to be inspected at the source to make sure that we obtained the proper varieties and proper wood. We feel further that with provision for splicing which has been adopted there should be enough of other woods available to meet the propeller requirements.

Before this was received a telegram was sent on the same day to Major Gray, with the signature of the Materials Department, to the effect that they were "anxiously awaiting telegraphic reply to letter Feb. 26." And on March 2 the Production Engineering Department, notwithstanding the statements in its telegram of March 1, telegraphed to the Materials Department as follows:

Regarding use of African mahogany for combat and bombing airplane propellers advise that such wood is acceptable for use in these propellers.

And on March 16 the Airplane Engineering Department (by Mr. Caldwell, on behalf of Major Marmon) wrote to Major Gray of the Production Engineering Department, referring to tests of propellers made of African mahogany at Langley Field and McCook Field, and stated the following

order of preference for propeller woods: (1) walnut, (2) Honduras mahogany, (3) cherry, (4) African mahogany, (5) quarter-sawn poplar, (6) quarter-sawn white oak. Mr. Caldwell stated further that the following species of African mahogany were acceptable: (1) Grand Bassan, (2) Lagos, (3) Benin; also that there was an African wood similar to mahogany, known as "Iroko," which had been found acceptable in the English propeller construction.

On March 21 Mr. Caldwell wrote to Lieut.-Col. Horner of the Equipment Division, stating that they had definitely ascertained that the wood they had tested came from Axim, and that "this wood would be acceptable at least to the extent of 3,000,000 or 4,000,000 ft." Mr. Wickliffe, on behalf of Mr. Lockhart of the Materials Department, sent the following memorandum to the Contract Section on the same day (March 21):

It is only recently that the use of African mahogany has been authorized in the construction of propellers, and therefore the entrance of purchase request to cover the quantities of African mahogany shown in the attached proposals (of the mahogany manufacturers) has been withheld pending such authorization. Permission has now been received for the use of this wood and purchase requests are being sent to the Priority Section today covering the quantity of African mahogany shown in the proposals of Astoria Veneer Mills and Dock Co., Palmer & Parker Co., Ichabod T. Williams & Sons, and C. C. Mengel & Bro. Co.

In view of the heavy demand for shipping facilities, a serious question arose with the Shipping Board as to the necessity of getting in the African mahogany. In a conference between Mr. Karl deLaittre, representing the Shipping Board, and Mr. Sibley and Mr. Wickliffe of the Signal Corps, on May 4, Mr. Wickliffe's attention was called to the lack of shipping space, and he replied (according to the stenographer's minutes produced by Mr. deLaittre):

Yes, but this is a matter of contract. We make our contracts in good faith on both sides. It is not permissible for the Government to break these contracts; it would break the people making them. We cannot let these people down on the African product.

At another point in the conference Mr. Wickliffe said:

If the timber from Africa is not brought forward, coming in June, and is allowed to deteriorate, the first part that will be hit will be the outside of the log, out of which the aircraft material comes. If we do not get this African lumber, we have exhausted every resource in walnut and cherry and in Central American mahogany. We do not yet know as to the use of quarter-sawn oak. Then if we do not get this timber we cannot get any African logs before June of the following year.

Meanwhile the subject had been taken up for investigation by representatives of the War Trade Board and of the Forestry Service. Its importance lay in the fact that there was an abundance of white oak available in this country, and it developed that there was opinion of considerable weight in favor of the use of oak on combat propellers.

On June 2 a conference was held between representatives of the Production Engineering Department, the Airplane Engineering Department, the Propeller Inspection Department, the Propeller Purchase Section and the Wood Inspection Section of the Signal Corps. Mr. Caldwell, who had written the letter of March 21, represented the Airplane Engineering Department. Lieutenant Ryerson's memorandum of this conference contains the following:

The question of the advisability of, and necessity for, importing African mahogany was carefully considered and it was the unanimous opinion that it would be possible to meet our present and future propeller lumber requirements from domestic or South American supplies, and that because of the difficulty of inspecting African mahogany, its further use in propellers should be discouraged.

On Aug. 3, 1918, Lieutenant Ryerson of the Propeller Section, having been asked for a statement of the requirements of woods for propeller stock, requested the Production Engineering Department for "an up-to-date formal statement" as to the kinds of lumber to be specified for combat propellers, in their order of preference. This brought a reply under date of Aug. 7 from the Production Engineering Department, through Professor J. S. MacGregor (head of the Physical Testing Department, School of Mines, Columbia University) as follows:

Answering your memorandum of August 3rd requesting information on kinds of wood for propellers we advise you herewith that this department has authorized the use of the following woods for combat propellers. The list is given in the order of their preference:

Black walnut.  
True mahogany (Honduras).  
Cherry.  
Quarter-sawn white oak.  
African mahogany.

The objection to African mahogany (aside from the shipping problem) was that it varied considerably in quality, and that inspection of it so far from its source would make it difficult to be sure that the right species was received

Throughout the controversy Mr. Wickliffe has expressed his views with considerable emphasis and has thrown the weight of his influence in favor of contracts for African mahogany and of the provision of shipping facilities to bring it in.

In support of his position he has produced a memorandum, under date of Aug. 23, signed by Charles Day, as special assistant to the Secretary of War, to the effect that "while oak propellers are being used with satisfactory results in connection with our training planes, they have not been adopted for planes for active service overseas on account of unsatisfactory results obtained abroad when their use has been attempted for any considerable period."

Mr. Wickliffe has also presented a letter under date of July 19 from Lieutenant Hollande, in charge of wood purchasing for the French Government, in which it is said that "we are buying a very great quantity of African mahogany in France direct from our colonies"; also a letter received from the office of the British War Mission giving information to the effect that "the home authorities propose during 1919 to use British Honduras and West African mahogany exclusively for propeller construction, cutting out walnut completely," and that demands from factories in England for propeller lumber are met "indiscriminately by the supply of either British Honduras or West African mahogany, the latter being considered as equivalent to the former for all purposes."

On the other hand, a very recent cablegram (Sept. 28) from the Scientific Attaché to the American Embassy in London in answer to an inquiry of the Research Information Service here, states that "authorities British opinion and practice placing walnut and Kauri, Nicaraguan, Cuban mahogany ahead of African. British would not use African if sufficient quantities of above were available. African used only in combination with other woods."

The statement to the contrary as to British practice is said to be incorrect, and it is added "British have not tested oak, cherry, poplar sufficiently to make comparison. American army wood experts now here state A. E. F. satisfied with oak and have advised Washington, D. C., accordingly. Poplar has also showed up well on tests. British unable to see any justification for U. S. using African mahogany in view of other furnishings available."

It is understood that ships for African mahogany were finally provided. Upon the evidence, it is apparent that the matter was the subject of discussion and presented grounds for differences of opinion.

The interest, however, of some of the leading mahogany manufacturers in obtaining contracts for the delivery of African mahogany is apparent, and while the efforts to induce its purchase and transportation may have been based upon the belief that the wood was better than that available here and that the supply was needed by the Government, the matter is one which should receive consideration in connection with the survey of the industry which has been suggested for the purpose of determining the fairness of the mahogany contracts and of the action taken under them.

### 3. Sabotage Act.—Grand Jury Proceedings

There have been occurrences in various plants indicating efforts to injure war material, or to make it defective, or to conceal defects, but on investigation it has generally been very difficult to find sufficient basis for criminal prosecution, either for lack of evidence as to the particular individual who had committed the act, or because on close examination it appeared that the condition of the material could be fairly attributed to carelessness, and evidence of criminal intent was wanting.

#### Hammondsport Plant of the Curtiss Company

In the course of this inquiry information was received that frequent attempts had been made to conceal defects in motors and their different parts which were in course of manufacture at the plant of the Curtiss Aeroplane & Motor Corporation, at Hammondsport, N. Y. Evidence having been obtained as to specific instances of this practice, there was an investigation in July last before a grand jury in the Western District of New York, John W. Ryan, Esq., of Buffalo, being appointed special counsel for the purpose, which resulted in the return of indictments against Lewis Longwell and Hector Bordeau, sub-foremen in the assembly room of the Hammondsport plant, under section 3 of the Sabotage Act of April 20, 1918. Demurrers to these indictments have been overruled and the cases are awaiting trial.

#### North Elmwood Plant

In view of the conditions found at the North Elmwood plant of the Curtiss Aeroplane & Motor Corporation, there was a special investigation through special agents of the Department of Justice for the purpose of discovering violations of

the Sabotage Act, with the result that evidence was brought before the grand jury in the Western District of New York, John W. Ryan, Esq., acting as special counsel, and indictments were obtained in September against Richard Eastman, foreman of the propeller department; Frank Truett, an assistant foreman, and David Rogovan, a workman, under the Sabotage Act. On Oct. 9 these defendants pleaded guilty and were fined \$500 each.

#### Liberty Iron Works.

Testimony given in this inquiry in relation to alleged irregularities at the Liberty Iron Works at Sacramento, Cal., led to a special investigation in charge of John W. Preston, Esq., Special Assistant to the Attorney-General, before the Grand Jury at Sacramento in September last. Considerable testimony has been taken, but no indictments have been returned.

### 4. Cross License Agreement as to Rights under Airplane Patents.

In view of claims under alleged patent rights, and with the object of facilitating aircraft production by providing for manufacture on a definite basis, a corporation was formed under the laws of the State of New York known as the Manufacturers Aircraft Association, Inc. This corporation entered into an agreement with its "subscribers," that is, its stockholders, called the cross-license agreement. The Government is not a party to the agreement, but it was recommended by the National Advisory Committee for Aeronautics, was endorsed by the Aircraft Board and received the approval of the Secretary of War and the Secretary of the Navy.

By the cross-license agreement, the subscribers grant to each other licenses under all airplane patents now or hereafter owned or controlled by them in the United States, its territories and dependencies (except foreign patents and certain specified patents); the corporation is designated as the agent of the subscribers to execute licenses accordingly; each subscriber agrees that it will not enter into any agreement or arrangement whereby its privileges under United States airplane patents or inventions will be diminished or surrendered so as to exclude or restrict the operation of the agreement, and that it will not grant licenses under any such patents for use in airplanes with reference to which it is receiving royalties under the agreement, to any other person, firm or corporation on more favorable or lower terms of royalty than those provided in the agreement, or which may become more favorable or lower during the term of the license.

Under the agreement in its original form, in providing for the payments to be made by subscribers, it is stipulated that each subscriber shall pay to the corporation \$200 for each airplane sold and delivered by the subscriber until the Wright-Martin Aircraft Corporation and the Curtiss Aeroplane & Motor Corporation (these corporations claiming to hold basic patents) had each been paid the sum of \$2,000,000. A supplemental agreement has since been made modifying the provision for payments by subscribers and providing that the aggregate payments to both the Wright-Martin Corporation and the Curtiss Company should be \$2,000,000 instead of \$4,000,000.

The agreement has been criticized upon the ground that its provisions constitute a hindrance to the progress of invention in the important airplane field and as being in restraint of trade. Whatever ground for criticism exists in this respect is to be found in the terms of the agreement itself, as these are quite definite and determine its operation and effect.

I shall not deal with the question of the legality of the agreement, as the question was specifically submitted by the Secretary of War to the Attorney General whether the association and the agreement were in contravention of the anti-trust statutes of the United States and the opinion was expressed by the Attorney General that they were not. That disposed of the question, in the absence of a contrary decision by the courts, so far as the action of the Executive department is concerned.

To the question whether the patents of the Wright-Martin Company and of the Curtiss Company are basic patents, and whether the payments for which the agreement provides constitute a proper compensation for the rights conferred, it would require an exhaustive examination of the patent situation to give a satisfactory answer, and this inquiry has furnished no opportunity for such examination.

For this reason no opinion is expressed upon the point further than to say that, if the validity of the agreement be assumed, the amount of the payments was a matter of sound administrative discretion, and there is no ground for the conclusion that the amount as fixed in the supplemental

agreement could not fairly be allowed. It is also asserted that the Government is left liable to other claimants, but this also requires an opinion upon the validity of certain patent claims which could not be dealt with in this inquiry.

#### General Conclusions and Recommendations

1. The controlling facts and the conclusions in relation to the matters reviewed have been stated under appropriate headings. It would be impossible to re-state them in a brief summary. The defective organization of the work of aircraft production and the serious lack of competent direction of that work by the responsible officers of the Signal Corps, to which the delays and waste were chiefly due, were matters for administrative correction through unification of effort under competent control. The provisions of the criminal statutes do not reach inefficiency.

It is not within the province of this report to make recommendations with respect to administrative policy, but it should be said that under the direction of Mr. Ryan and Mr. Potter there has been improvement in organization, and progress has been made in gratifying measure.

2. The evidence discloses conduct, which although of a reprehensible character can not be regarded as affording a sufficient basis for charges under existing statutes, but there are certain acts shown, not only highly improper in themselves but of special significance, which should lead to disciplinary measures. The evidence with respect to Colonel Edward A. Deeds should be presented to the Secretary of War to the end that Colonel Deeds may be tried by court martial under articles 95 and 96 of the Articles of War for his conduct (1) in acting as confidential adviser of his former business associate, H. E. Talbott, of the Dayton Wright Airplane Co., and in conveying information to Mr. Talbott in an improper manner, with respect to the transaction of business between that company and the division of the Signal Corps of which Colonel Deeds was the head; and (2) in giving to the representatives of the Committee on Public Information a false and misleading statement with respect to the progress

of aircraft production for the purpose of publication with the authority of the Secretary of War.

3. The absence of proper appreciation of the obvious impropriety of transactions by Government officers and agents with firms or corporations in which they are interested, compels the conclusion that public policy demands that the statutory provisions bearing upon this conduct should be strictly enforced. It is therefore recommended that the officers found to have had transactions on behalf of the Government with corporations in the pecuniary profits of which they had an interest, should be prosecuted under section 41 of the Criminal Code.

4. The Federal Trade Commission should be requested to report upon the proper cost of mahogany for airplane propellers, to the end that upon the coming in of its report the question of the propriety of further action with respect to the transactions of the Mahogany Manufacturers and Importers Association may be determined.

5. It is recommended that the representatives of the Department of Justice should keep in touch with the progress of the re-audit of accounts so that it may be advised of the complete enforcement of the rights of the Government in final settlement of accounts, and that the Government has been fully protected against unnecessary loss through waste and the absence of suitable factory supervision.

6. Permit me also to suggest that a special division, or sub-division of the present Bureau of Investigation, in the Department of Justice should be assigned to the consideration of suggested delinquencies in connection with aircraft production so that the work already done may be appropriately followed up. In particular, it is recommended that the activities in relation to Spruce Production, which being largely centered on the Pacific Coast it was impracticable to embrace in the present inquiry, should be carefully scrutinized.

I have the honor to remain,

Respectfully yours,  
(Signed) CHARLES E. HUGHES.

## Statement by Attorney-General Gregory

October 31, 1918.

THE PRESIDENT,  
The White House.

Dear Mr President:

On May 6 last, you directed me to investigate and pursue charges of dishonesty or malversation in regard to the production of aircraft and, on May 13, you asked Judge Charles E. Hughes to act with me in making this investigation. By far the larger part of the last five months has been consumed in taking testimony. An opportunity has been given to every person claiming to have grievances, charges, or criticisms, to appear and testify in person or produce other witnesses and data.

We spent many weeks in personally inspecting conditions and taking testimony at the larger plants having aircraft contracts with the Government at Dayton, Ohio; Detroit, Michigan; Elizabeth and New Brunswick, New Jersey; and Buffalo, New York. The papers, books, correspondence, accounts and other records in the files of the Signal Corps at Washington, as well as those of the principal contractors and of the Government at these plants, have been critically examined as far as there was reason to believe that they would throw light on the matters under investigation. We have examined nearly three hundred witnesses and taken about 17,000 pages of testimony.

In an effort to make the investigation thorough, we have attempted to go into every phase of aircraft production since our entry in the war in April, 1917, and had recourse to every source of information which appeared available.

Every complaint or charge of wrongdoing has been heard and carefully considered. It is believed that the investigation has been exhaustive, except that full data as to contracts let abroad for planes has not been at hand, and the matter of spruce production on the Pacific Coast has been gone into only to the extent that this could be done by the examination of witnesses at Washington.

From the investigation made, it has been concluded that the taking of the additional time necessary for obtaining complete data from Europe in regard to the contracts in question, or for a trip of investigation to the Pacific Coast where most of the spruce is produced, was not justified. During the period referred to, Judge Hughes has given practically his

entire time to this work and has been in direct charge of the investigation, which has been conducted by him with the cooperation of myself and other officials of the Department of Justice. The investigation has now been completed.

Some three weeks ago, at the conclusion of the taking of testimony, in order that you might have the independent judgment of both, Judge Hughes and I, each without conference with the other, considered the evidence, reached his own conclusion and prepared a report.

On the afternoon of last Saturday, Oct. 26, Judge Hughes handed me a copy of his report, together with a letter asking me to transmit it to you with whatever statement of views I wished to make.

The report consists of 182 printed pages. By far the greater portion is devoted to a remarkably accurate statement of substantially all the transactions had since the beginning of the war in the course of the development of the aircraft program. After carefully examining this statement of the transactions had, I find myself in substantial accord therewith and do not consider it necessary to present to you a somewhat full report which has heretofore been prepared in the Department of Justice. As hereinafter shown, I also find myself in accord with the conclusions presented by Judge Hughes on questions of dishonesty and malversation.

I do not consider it germane to this investigation to enter into criticisms of the program or of mistakes in policy or in the exercise of judgment.

I send you herewith Judge Hughes' report and present herein my conclusions and briefly supplement Judge Hughes' findings of fact in a few instances.

#### General Character of Charges

When the investigation began in May, it was sweepingly charged that \$691,851,866.47, appropriated for the fiscal year beginning July 1, 1917, had been expended with practically no results; that members of the aircraft boards had been financially interested in aircraft contracts; that German and disloyal influences had retarded the progress of the work, and that these influences, together with graft of various kinds, had entered into the transactions involved. It therefore seems desirable to state briefly what sums have been expended and what has been accomplished.

**Amount Expended**

The \$691,851,866.47 appropriated was all for aviation purposes, including many things besides the building of aircraft. Contracts for airplanes and motors let here and abroad, it was estimated, would require \$474,910,706.55, but in May last this amount had by no means been expended. The actual disbursements for this purpose up to the close of the fiscal year ending June 30, 1918, were as follows:

For production in this country .....	\$106,741,490.77
For production abroad .....	25,605,074.31
For experimental and development work .....	1,697,830.19
<b>Total .....</b>	<b>\$134,044,395.27</b>

This amount includes not only the cost of planes and motors delivered, but also large payments for special tools and for labor and materials in planes and motors not then finished. The figures are not now available to show just how much more has been disbursed on this account since June 30, though the total amount disbursed for all aviation purposes between that date and Sept. 30 was \$139,186,661.33.

**Planes and Motors Acquired**

To provide for the needs of the Army until production in this country could be expected, contracts were let, in the summer of 1917, in France for 875 training planes with engines and for 5000 service planes and 8500 service engines, deliveries to begin in November and be completed in June, 1918, and in Italy for 700 service planes with engines. These contracts were not carried out as contemplated, partly because of unavoidable delay by this Government in delivering materials, but largely because the unexpected increase in the needs of the French Government overtaxed the capacity of the manufacturers. However, up to July 31, 1918, there had been acquired under foreign contracts 1617 training and 1512 service, or a total of 3129, planes with engines. The deliveries of planes and engines produced in this country up to July 1, 1918, were:

<b>Planes</b>		
Elementary training .....	4,572	
Advanced training .....	1,046	
Service .....	553	
		6,171
<b>Engines</b>		
Elementary training .....	7,662	
Advanced training .....	2,579	
Service .....	2,392	
		12,633

Since July 1 production has been such that up to Oct. 11, 1918, the figures were:

<b>Planes</b>		
Elementary training .....	5,187	
Advanced training .....	2,137	
Service .....	2,350	
		9,674
<b>Engines</b>		
Elementary training .....	10,256	
Advanced training .....	4,479	
Service .....	9,937	
		24,672

When the 3129 acquired abroad are added, we have total planes 12,803, and 27,801 engines. While the only service planes thus far produced in this country have been observation and bombing planes, those acquired abroad include pursuit and combat planes.

**Conduct of Members of Aircraft Boards**

making of enormous quantities of machinery and tools, and the development of an industry almost unknown in this countless conflicting information from abroad, the proper types of planes and engines, securing responsible and efficient contractors to engage in a new line of work, the designing and

The results, as above set out, in view of the inherent difficulties of hurriedly expanding the Signal Corps from almost nothing to an immense organization, selecting, upon more or try and undergoing constant changes abroad, cannot be said to indicate dishonesty or malversation.

An exhaustive examination into the entire conduct of aircraft matters fails to show that any member of either board has had any desire to retard or delay production, or has done anything intended to accomplish that result, or has intentionally caused the waste of funds, or been actuated by a disloyal motive, or been guilty of dishonesty or malversation, unless there be truth in the specific charges which will now be referred to.

**A. Interest in Contracts**

I agree with the conclusion reached by Judge Hughes that there is no evidence upon which it can fairly be charged that any member of the aircraft boards, including Mr. Howard E. Coffin, General Squier, Col. E. A. Deeds, Col. R. L. Montgom-

ery, Col. S. D. Waldon, Mr. Richard F. Howe, Mr. Harry B. Thayer, Admiral Taylor, and other naval officers, has been unlawfully interested in any contract or transaction relating to aircraft production. Indeed as to this charge, there has, at no time, been ground for a question involving any of these gentlemen except Colonel Deeds.

**B. Form of Contracts**

Growing largely out of the popular understanding that contracts for aircraft provide that the compensation of the contractor shall be a fixed per cent of the cost of production, and thus make it to the interest of the contractor to increase that cost, the charge has been made that these contracts are themselves instruments for practicing frauds upon the Treasury.

The fact is that no such contracts have been made. The Government is to pay the cost of production plus a fixed sum, which cannot be enhanced by increasing the cost of production. On the contrary, it is provided that the contractor shall share in the saving if the actual cost shall be less than an "estimated cost" stated in the contract. Hence, whatever other objections there may be to the contract, it is to the interest of the contractor to keep the cost of production as low as possible. Moreover, the right is reserved to the Government to terminate the contract at any time by repaying the amount expended plus the fixed profit on finished articles and 10 per cent of the cost of labor and materials in unfinished articles. If, therefore, experience should demonstrate that the contract would be unfair, the Government could terminate it unless the contractor would agree to a readjustment of terms.

In the case of the Liberty motor contracts, the practical result has been first a reduction of the estimated cost from \$6,087 to \$5,000 and of the fixed profit from \$913 to \$625, and finally the putting of the contracts on a fixed-price basis when experience had shown what would be a fair price.

In view of the fact that when this form of contract was adopted there was no available data as to what the cost ought to be, it seems to have been devised to protect the interest of the Government. I am unable to see how an inference of bad faith or official dereliction can be drawn from it.

**C. Awarding of Contracts**

There have been charges of unfair discrimination and favoritism in the awarding of contracts. These complaints relate almost entirely to contracts for planes, for which there were many applicants. Selections had to be made. It cannot be said that plausible reasons were wanting for those made. If mistakes were made nothing has been developed which would justify the charge that they resulted from corrupt motives.

**D. Profits of Contractors**

It has been charged that exorbitant profits to contractors have been allowed. On their face, they appear to be unusually liberal, but when it is remembered that 60 per cent or more of them must be paid to the Government as income and excess profits taxes, and that most of the net profits will be invested in buildings and facilities which may or may not be capable of profitable use for an indefinite period after the termination of the contract, my conclusion is that no such profits have been allowed as to justify a charge of bad faith.

**E. Cross-License Agreement**

Whatever may be said of the charge that this arrangement tends to discourage future inventions, one of its results was to enable the Government, through contractors, to secure the use of all the necessary patents at a fixed cost and with little friction. It was not entered into until the Attorney General had given an opinion that it did not conflict with the anti-trust law. I find no basis for the suggestion that in bringing it about the members of the aircraft board were actuated by any unlawful or dishonest motive.

**F. Conduct of Col. E. A. Deeds**

Of all the members of the aircraft boards, the one most severely criticised and against whom most charges have been brought has been Col. E. A. Deeds. The evidence does not disclose any violation by Colonel Deeds of the criminal laws. In the early part of 1918, public statements were issued with official authority purporting to set out the progress which had then been made in the production of engines and planes and the prospects of the immediate future. These publications were not only misleading, but they contained false statements, and were issued in reliance upon information principally furnished by Colonel Deeds, who was acquainted with the actual facts. While the conduct of Colonel Deeds in this

matter was not criminal and cannot be said to have affected actual production, it was inexcusable and reprehensible.

I also find that Colonel Deeds was guilty of censurable conduct in acting as confidential adviser of H. E. Talbott and in conveying information to the latter with respect to transaction of business between the Dayton Wright Airplane Company and the division of the Signal Corps of which Colonel Deeds was the head.

Whether or not Colonel Deeds should be subjected to disciplinary measures for the acts referred to is a matter to be determined by the War Department. I acquiesce in the recommendation of Judge Hughes that the facts be submitted to the Secretary of War.

#### Officers and Employees of the Signal Corps

When war was declared and the carrying out of the aircraft program was entrusted to the Signal Corps, its official personnel was hurriedly increased from a small organization to one of enormous proportions. It has been impossible, of course, to critically examine the conduct of all the military officers and civilians connected with this branch of the service. The official acts of the more prominent ones have been gone into and the general situation has received as much consideration as was possible. The investigation has failed to show, unless the instances hereinafter noted constitute exceptions, that any person, military or civilian, connected with the Signal Corps, has desired to retard or delay production, or has done anything intended to accomplish that result, or has intentionally caused waste of funds, or has been actuated by disloyal motives, or been guilty of dishonesty or malversation. The incidents referred to are as follows:

#### A. Conduct of Lieutenant-Colonel J. G. Vincent, Lieutenant-Colonel George W. Mixter, and Second Lieutenant Samuel B. Vrooman, Jr.

Many successful business men tendered their services to, or were invited to take part in the activities of, the Signal Corps. Naturally the men selected were chosen as far as was practicable from lines of business similar to those in which the Government expected to utilize their services.

With the business interests of the country so largely involved in war work, many of these men, in the course of the performance of their official duties, not infrequently were brought in contact with corporations in which they held stock. It is to their credit that only three instances have been found in which officers or employees of the Signal Corps have apparently transacted business for the Government with corporations in which they were interested.

One of these was Lieutenant-Colonel Vincent, who had been vice-president of the Packard Motor Car Company, in charge of engineering, and who, after he became an officer in the Signal Corps, continued to hold certain shares of stock in that company.

He was one of the original designers of the Liberty motor, held several important positions in the engineering department, and is now in charge of the Airplane Engineering Division of the Bureau of Aircraft Production. Under the circumstances set out in Judge Hughes' report, Lieutenant-Colonel Vincent was instrumental in having certain payments made to the Packard Motor Car Company for drawings, models, tests, etc., and for eleven standardized engines.

The course of procedure which resulted in the payments of this money was without a written contract and otherwise irregular and unusual. I agree with Judge Hughes' conclusion that Lieutenant-Colonel Vincent violated Section 41 of the Criminal Code, which prohibits any person, directly or indirectly interested in the pecuniary profits or contracts of a corporation, from acting as an officer or agent of the United States for the transaction of business with such corporation.

I further agree with Judge Hughes that the evidence does not afford ground for the conclusion that the Government was defrauded, or that there was any intent to defraud on the part of any of the parties concerned, or that the services rendered were not worth the amount paid therefor, or that the estimates of the outlay of the Packard Company were not fair estimates.

Lieutenant-Colonel George W. Mixter held twenty-five shares (par value \$2,500.00) of the preferred stock of the Curtiss Airplane and Motor Corporation. This corporation had important contracts with the Government for the production of airplanes. While holding this stock, Lieutenant-Colonel Mixter was in charge of the organization for the inspection of materials and products at one of the corporation's plants, and visited it from time to time in the exercise of his authority as head of the Inspection Department and as Production Manager.

He stated on examination that he had bought a small

amount of common and preferred stock of the of the corporation mentioned some years before and remembered selling some of it, that he did not remember whether he retained any and had not thought of it after entering the service. It appears that he had parted with ownership of the common stock, but still owned the preferred. I agree with the conclusion of Judge Hughes that this was a violation of Section 41 of the Criminal Code.

Second Lieutenant Samuel B. Vrooman, Jr., was the owner of \$10,000.00 in par value of the stock of the S. B. Vrooman Company, of Philadelphia, which had a contract with the Government for supplying mahogany. While holding this stock, Lieutenant Vrooman was put in charge of the inspection of propeller lumber, including mahogany.

He elected the district officers, who in turn selected the inspectors; he issued instructions to the district officers and visited various plants to see that the inspectors were doing their duty and to pass on disputed points. The plant of the S. B. Vrooman Company was one of those subject to his jurisdiction but he denies that he ever personally inspected its lumber. I agree with Judge Hughes' conclusion that he violated Section 41 of the Criminal Code.

#### B. Conduct of Mahogany Manufacturers and Importers Association.

For a short period of time J. C. Wickliffe, J. Edward McCullough, and Second Lieutenant Samuel B. Vrooman, Jr., while representing the Government in dealing with mahogany manufacturers, received from one or more of these manufacturers salaries in addition to those paid by the Government. I agree with Judge Hughes that under the circumstances this was a gross impropriety on the part of those paying and those receiving the additional salaries, but that there is no statute making it a criminal offense unless a case is made out of bribery or of a conspiracy to defraud the Government. I am likewise of the view expressed by Judge Hughes that whether a charge of the sort indicated could be properly made would largely depend upon whether the terms and prices of the mahogany manufacturers were fair and reasonable, or excessive and the result of improper influence, and that the Federal Trade Commission, with its special facilities for conducting an examination of that kind, should be requested to make a survey of the mahogany industry and the cost of delivering the lumber involved and reach a conclusion as to the reasonableness of the prices paid.

#### C. Matters of Minor Importance

In one office of the Signal Corps there seems to have been discovered petty graft fostered by a civilian employee, and evidence has been brought to our attention tending to establish dishonest inspection on a rather small scale in one of the least important plants. These matters are now under investigation by grand juries and indictments will be found if justified.

#### Contractors

A searching inquiry has been made into the conduct of the work by the principal contracting companies. Agreeing substantially, as I do, with the statement of facts made by Judge Hughes, I am of opinion that it cannot fairly be charged that a managing officer of any contracting corporation has desired or attempted to delay production or been actuated by disloyal motives. To what extent, if any, inefficiency or mismanagement is to be inferred from the facts stated, I do not deem it within my province to determine.

#### German Sympathizers

In some of the factories a considerable number of alien enemies and persons of German birth or descent, who, at least before our entry into the War, were German sympathizers, have been employed. No facts have been developed which would justify the belief that these men have been retained through any willingness on the part of their employers to have production retarded or defective planes produced. On the contrary, the Government itself provided a system of permits under which they could be used.

They were employed and retained because the manufacturer felt that the great difficulty of obtaining skilled laborers in sufficient numbers justified such risk as might be incurred. In some instances the employer had faith in an old employee and was unwilling to discharge him because of mere rumors as to his loyalty. As an illustration of this, the head of the drafting department at the Ford Company's plant was of German birth and there were such persistent rumors that he was pro-German that some of the officers of the company thought it unsafe to retain him.

He had been in the employ of the company for nine years, professed to be loyally interested in the work, and the officers referred to testified that nothing definite could be proved against him. Mr. Ford stated that, at a time when all citizens were called to make sacrifices, one of German birth might do so by helping to produce motors to be used for his adopted and against his native country.

He stated further that he had absolute confidence in this man's loyalty and, in the absence of any proof of disloyalty, refused to discharge him. While this indicated the indicated the application of an almost idealistic policy of being just to employees, results seem to have justified the course pursued.

Though this man has been the object of the greatest watchfulness on the part of officers of the company who suspected him, nothing has been discovered indicating that he has been other than a loyal and efficient employee.

It is fair to say that no sinister or disloyal influence has affected production in the Ford plant. The factory manager testified that there had been no sabotage and no efforts to retard production. Results in the Ford Motor Company compare favorably with those in the best of the companies manufacturing Liberty motors.

Its contract for 5,000 motors was let in November, 1917, nearly three months after contracts had been let to the Packard and Lincoln companies for 6,000 each. Up to October 11, 1918, it had produced 1,868, while the Packard Company had produced 3,864 and the Lincoln Company 2,787. Not a case of sabotage has been reported to the Department of Justice from this plant. Indeed it can be said that but little trouble has been traced to aliens or alleged German sympathizers in any of the plants.

#### Sabotage

To what Judge Hughes has said on this subject, I wish to add that since his report was handed to me I have had the records of the Department of Justice examined for the purpose of ascertaining the number of substantial complaints of sabotage in the factories engaged in manufacturing aircraft, motors, or parts for the Government.

The result shows twelve such complaints. Upon these complaints and the investigations which followed seven men have been indicted, two of whom have pleaded guilty and five of whom are awaiting trial. In this connection, it is interesting to note that during the past eighteen months somewhere between 100,000 and 200,000 laborers have been engaged on Government work in the factories indicated.

Respectfully yours,  
(Signed) T. W. GREGORY,  
Attorney General.

#### Hughes Report a Vindication

(Continued from page 744)

that the plant is a permanent one admirably designed for commercial work, and that there is every prospect that it can be successfully utilized."

In summarizing, the report adds "the large percentage of the contractor's profits which will be taken by the Government in taxation should fairly be taken into account, but the contemplated tax does not justify an extravagant scale of profits which, even after payment of taxes, would permit an excessive return upon the capital invested in view of the greatly reduced risks of the contractor under the cost-plus contracts."

Under the latest revised contract with the Lincoln Motor Co. and others dated July 1, 1918, however, the Liberty engine price has been fixed, according to the report, at \$4,000 per engine, and hence the profits estimated above are accordingly reduced by 20 per cent. On this basis the Lincoln company will earn \$11,250,000 on a contract of 9000 engines to be delivered by April 1, 1919.

Labor conditions were found to be generally unsatisfactory. Turnover at the Packard plant, for example, was found to be at the rate of 400 to 600 per cent a year, 40,000 men coming and going in a year in order to maintain an organization of 10,000 men. Similar conditions were found elsewhere and in a number of plants difficulties caused by labor organizations; objections to women workers was encountered. Where women have been employed the results are pronounced satisfactory.

Extravagant labor costs were found in a number of factories, particularly in the North Elmwood plants of the Curtiss company, and due principally to the employment of more workers than were necessary.

Some alien enemies were found to be employed in the Packard, Wright-Martin and Ford plants, the Ford company having 250 German aliens engaged in war work, operating under special permits granted on the company's recommendation. A few instances of trouble as a result of this have occurred.

Objections are stated in the report to the payment of "exorbitant" salaries to executive officers, and Talbott and Kettering of the Dayton-Wright Airplane company are mentioned as drawing annual salaries aggregating \$100,000, while Mingle of the Standard company, who was to be paid at the rate of \$63,000, has thus far been allowed at the rate of \$15,000 per year.

The Mahogany Manufacturers' and Importers' Association, formed to co-operate with the Government and meet the demands for wood for propeller manufacture, comes in for some criticism due to the prices asked for mahogany and also to the fact that some members of the industry have received money from the association while at the same time accepting compensation from the Government. *There is no criminal act in this, according to the report, but there would be if bribery existed.*

BRITISH experience has demonstrated the value of the piece rate system as an incentive to output. Observations of speed under a piece-rate system also point to the conclusion that maximum production is best secured from women employees by piece-rate payments. Yet this very eagerness to secure high wages and unwillingness to take advantage of rest periods suggest the danger of such an incentive unless proper health supervision is assured.

THE entire lower peninsula of Michigan has been divided into thirteen districts in accordance with plans perfected under the direction of the War Industries Board. A chairman has been appointed for each district to act as the point of contact with the general supervisor, Allen A. Templeton. The entire state organization is styled the Regional Industrial Commission and was organized for the purpose of obtaining war contracts for such manufacturing concerns as were in a position to accept them and had the required facilities for production. According to the War Industries Board fully 60 per cent of the war work in this state is produced in District No. 1 and surrounding territory. About 25 per cent is produced in the Jackson district. This means that 85 per cent of Michigan's output of war work comes from the southeast corner of the state.

# Analysis of Automobile Merchandising in New Zealand

## PART III

### Service Was Started with American Car Sales—Good System of Macadam Roads Linking Cities—Possibilities of Truck Sales—Leading Industries

By G. A. Worrall\*

**A**T the present time there is a remarkable situation existing. Horse feed is extremely high, as well as leather, iron for horseshoes, and labor, which makes the use of the horse almost impossible for carting and hauling at former rates. On the other hand, it costs 40 per cent of the list price to land a truck to-day, gasoline is \$5.50 to \$6 per case of 8 Imperial gallons, and the type of man who can operate a truck is almost impracticable.

In Christchurch, which lies on a level plain, and to which electricity is furnished by water power, the electric truck has become very popular. Garage and maintenance charges for one month are only \$3. With this in mind, we can turn to the City of Melbourne, Australia, which city has sold all of its motor trucks and replaced them by horse drawn vehicles.

On the whole, New Zealand is extremely mountainous, which calls for a motor with plenty of power.

The truck market has only been touched. Up to the present day the demand has been created for them by the city carrier or drayman and the country carrier. Besides the further development of this field there is a much larger field in sight, namely, passenger transportation, sight-seeing, mail and passenger service, and the various merchants engaged in indenting and numerous factories all located in the larger centers. Also the ever-progressing dairying and flax industries are now making demands for rapid transit.

\*Mr. Worrall spent 11 months in New Zealand as special representative of the foreign department of the White Co. He traveled on both islands and studied conditions for automobiles and trucks.

The bulk of the present users handle the wool during the wool season, which runs from November to February. During that period over 100,000 tons or 35,000 loads of wool must be brought to the railway depots from the inland districts, and shipped to large distributing centers, where it is again moved to the shipping docks. The hauls vary from 1 to 50 miles, and the scale of prices varies also. An average example is 70 cents per bale of 336 to 450 lbs. for a run of 14 miles, with a load of seventeen bales. The ideal truck for this work is the 5-tonner, but the bridges will not in all cases support them; therefore 3-ton or 3.5-ton is in general use, equipped with a 35 to 45-horsepower motor.

The season during which the wool is moved is delightful. During this period, while there is plenty of rain to keep the roads in good condition, it is never excessive. However, during the winter months, June to October, there is an abundance of rainfall, which makes many of the roads in the back districts impassable. During this period the carrier must be on the alert to find contracts to tide him over. The country carrier usually transports freshly fallen timber to be used as firewood, or to be sent as material to be used for fence posts, and on his return trips he carries the daily supplies for the farmer, finished fence posts, fertilizer, and building materials for new construction work, while the city carrier must contract for bulk work, or make special prices for general haulage work with large coal or meat companies.

It should be borne in mind that in New Zealand the long ton or 2240 lbs. is in general use, and the short ton used in America is rarely, if ever, used. The American

*Left—Tractor engines were used for drawing wool, but are passing out and the truck is taking their place. New roads are bringing ordinances against these heavy iron tires. Right—Loading truck with wool in bales of 300 to 600 lbs. All station owners have presses for compressing the wool*

*Mt. Egmont in Taranaki, which is the center of the province. There is a 100-mile metal road around it. This is a progressive road area. It is a dairy country*

truck maker must sell his truck on the long-ton rating rather than on the short-ton rating.

Pressed-on solid tires are best for all New Zealand, as all centers of population have tire presses for removing or fitting such tires.

### **New Zealand's Industry**

Wool is the foremost industry of New Zealand. It is transported from the back or interior districts by steam tractors, horse teams and motor trucks. Not infrequently it is brought part of the journey by horses, and, when good roads are reached, transferred to motor trucks. More high-grade wool is exported from New Zealand than from any other section of the world.

To-day all the lumber is brought from the island by steam tractors and horse teams to the commercial centers. Motor trucks have not been able to engage in this work because of road conditions in the interior. Although the two islands have 2800 miles of narrow-gage railroad and an exceptionally long coast line there is still a good opportunity for greatly increased use of motor trucks in the lumber industry.

Possibilities for motor trucks in New Zealand cities are much the same as those in cities of corresponding population in different countries. Auckland, the largest city in North Island, with a population of 102,000, is a distributing and commercial center with large ship-building ways, sugar refineries, pottery factories, timber mills, etc., and offers a field for motor trucks much the same as any city of corresponding population. In this island is Wellington, with 70,000 population, which is a distributing and commercial city operating on a smaller scale. Christchurch in the South Island, with a population of 78,000, is also a commercial and distributing center with many small factories.

The frozen meat industry is an important one and generally the meat has to be transported from the freezing establishments to the wharfs for oversea shipment.

Butter and cheese have to be brought from inland dairy factories, which are numerous, to the cold storage houses at the seaport.

In addition to the larger cities mentioned there are in all of the provinces small cities with populations from 10,500 down. These cities have importance in the motor truck field in that they are shipping points for wool, which is generally transported from the station owner or sheep raiser's farm to these towns or cities.

Although the two islands of New Zealand, having a total overall length not exceeding 1000 miles and the

greatest width 250 miles, would, in ordinary circumstances, be an easy area to distribute over, nevertheless the fact that the country is divided into two islands, the North Island and the South Island, and also due to the fact that there are only 3200 miles of railroad on the two islands, it is impossible to cover the two islands from one distributing center, and the problems of distributing automotive apparatus thus becomes more involved than in many countries of much greater area, where there is one city that can be looked upon as the major distributing center for the entire area.

American manufacturers of any kind of automotive apparatus, such as farm tractors, trucks, cars and accessories, will have to appoint practically four distributors for the two islands and have direct factory connections with each of these four. The two islands are practically the same size, each approximately 500 miles in length, and in the North Island Auckland and Wellington are the two centers in each of which a distributor should be appointed. The South Island has two distributing centers, Christchurch and Dunedin. These are the four leading cities of the island and have distribution facilities to approximate one-quarter of the total area of New Zealand. Three of these centers are served directly by ocean liners which call at Auckland and Wellington in the North Island and Dunedin in the South Island. Christchurch on the South Island receives its shipments by transshipment from Wellington, or in case of large shipments they can be landed at Littleton, which is the seaport for Christchurch.

The territories served by each of the four distributors located in these centers are practically alike so far as the fundamentals of carrying on business are concerned, the carrying of spares, regulations concerning imports, and types of vehicles used. In all four areas the five-passenger touring car is the popular vehicle and the closed car has scarcely started. There is a very limited demand for two- or three-passenger runabouts.

### **Wellington a Big Motor Truck Center**

Motor trucks have at present their biggest field in territory served by Wellington, which is the southern portion of the North Island. This territory has more motor trucks than the remaining three distributing areas combined. This is because the Wellington district is well supplied with railroads. It contains the center of population of the islands and the wool industry, which is the principal one of the islands located in this area. The northern portion of North Island, which constitutes the Auckland distributing area, is a poor motor truck field because the country is not developed and the use of trucks is confined to the areas adjacent to the city of Auckland, with its population of 100,000.

The Christchurch area is roughly the center portion of the South Island, a territory embracing the Province of Canterbury, which is approximately one-quarter of the island. This is largely devoted to agriculture and stock-raising, and the truck field is limited to the city of Christchurch, with its population of 80,000, and to the station owners or sheep raisers whose wool has to be transported to Christchurch for shipment.

Christchurch is particularly well suited for electric trucks because the city is level, being located on a plain. The municipality owns its water power and is prepared to furnish cheap electric current. So low is the electric rate that a 2 or 3-ton truck can be charged and stored for not more than \$3 per month.

The Dunedin distributing area, which is, roughly, the lower quarter of the South Island, is a poor area for motor trucks in that the country is not so well developed. The land is largely pastoral and exports are agricultural

products and frozen meats which call for the limited use of motor trucks in transporting to seaport.

The distributors in each of these four cities have dealer organizations similar to those in any distributing territory in America. For example, the Wellington distributor has in his territory perhaps ten cities of population in excess of 10,000 each, and in each of these has a dealer, agent, or branch where showrooms, garage and repairshop are centered. The stock of spares is generally carried with the Wellington distributor. He reaches practically all of his territory by railroad, the map, printed in a previous installment, giving a good indication of the places served. The Wellington distributor serves the northern part of the South Island or the Province of Marlborough and Blenheim, and these are served by connecting boat lines.

The Christchurch distributor handles his field generally, but has fewer cities of this population. The same applies to Auckland and Dunedin. Like the other countries south of the equator, where the seasons are diametrically opposite to those in the United States, the selling season is reversed. Here it begins in November and the height of the season is reached at the period of maximum wool movement, which comes in January and February. It is during this period that the distributor must have his stock of cars on hand for immediate shipment to dealers and when he must be stocked up with repairs.

The selling propaganda of the passenger car distributor begins late in October and is continued until March. The circuit of local fairs, which has become an important selling factor, begins in October and continues until March.

### Truck Selling Period in New Zealand

The truck selling period is somewhat different. The best selling months are November and December, so that the distributor begins his selling propaganda the latter half of September and early in October. Trucks are sold all months of the year more or less, but the peak comes in November and December, because the wool movement starts in November and continues during November, December, January and February. All New Zealand dealers outside of the four distributing centers stock cars and have them ready for delivery. With trucks this has not been done until very recently, but to-day several of the dealers are stocking. The enterprising distributors in the four large centers are well supplied with repairs, which are carried uniformly during the twelve months of the year.

The majority of motor cars sold in New Zealand during the last few years have been cash transactions, but

*Driving sheep to the slaughter house. They are driven as far as 100 miles*

motor trucks are invariably sold on time ranging from 4 to 18 months. Twelve months represents a fair average of the time-payment period on trucks. It is up to the distributor not only to finance his dealers but also to carry the financial burden of time sales.

### Death of Prof. Bertram Hopkinson

COLONEL BERTRAM HOPKINSON, better known to automotive engineers as Professor Hopkinson of Cambridge University, lost his life in an airplane accident some months ago. He was a son of Prof. John Hopkinson, who formulated the law of the magnetic circuit, and was educated at Kings College and Cambridge University. For five years after completing his education he was engaged in consulting engineering work, mainly on electric light and power installations. In 1903 he was appointed professor of engineering at Cambridge. At a somewhat later date he turned his attention to the study of gas engine phenomena and became a member of the committee on Gaseous Explosions, of the British Association for the Advancement of Science.

This committee has done much work in clearing up some of the mysteries connected with the phenomena of explosions in engine cylinders, and a great deal of credit for this work is due Professor Hopkinson. On ignition in a gas engine cylinder, the maximum pressure attained is only about one-half of the figure calculated from the supply of heat energy and the formerly accepted values of the specific heat of the products of combustion. An hypothesis long popular was that the discrepancy was due to dissociation, but the experiments of the committee proved this view to be untenable. Part of the discrepancy was traced to the fact that the specific heats of the products of combustion increase considerably with rising temperatures, but Hopkinson proved that much of the defect of pressure was to be ascribed to radiation phenomena. As the energy lost by radiation varies as the fourth power of the absolute temperature, the loss to the walls becomes very serious at the temperature of the explosion which may reach 2000 deg. C. Measurements made in Professor Hopkinson's laboratory showed this loss to be very large, and an explanation was thus afforded of the fact that in practice the use of extremely rich mixtures had been found unprofitable.

Dr. Hopkinson also helped to clear up another puzzle in gas-engine practice. In Sir Dugald Clerk's early experiments on the explosion of gaseous mixtures, which were made with the gas in a static condition in a closed vessel, an appreciable time was required to effect the explosion. This time was in fact in some cases greater than the total duration of the stroke in motor car engines. There is thus in practice a notable acceleration of the explosion which was traced by Dr. Clerk to the turbulence of the gases consequent on their entry into the cylinder at a high speed, and this view was confirmed by Professor Hopkinson, who found that with a 10 per cent mixture of coal gas and air in an explosion vessel the time of explosion could be accelerated by stirring up the mixture by means of a fan. Thus with the fan stationary, the time of the explosion was 0.13 sec., and this was reduced to 0.02 sec. when the fan was run at 4500 r.p.m.

*There is a great deal of passenger service by bus outside of Wellington, Christchurch and Napier. These lines run 40 miles out*

# The F O R U M

## Diesel and Similar Engines

By Harold B. Wilson

*Engineer, Kwang Tung Electric Supply Co., Canton, China*

I HAVE just received the War Number of AUTOMOTIVE INDUSTRIES. It was a banner number for the engineer in a far country who wants reliable information on war activities.

There was one point discussed at the S. A. E. meeting that I do not believe was given careful consideration, namely, the naughty air compressor on a Diesel engine.

In the early stages of Diesel development the air compressor did give no end of trouble. To concerns just starting in the Diesel building game the air compressor will probably give trouble, but the old builders have solved their difficulties with this piece of machinery. We have five different makes of compressors in our power plant and only one of them gives trouble. That one has a very poor mechanical design. Some of our compressors are ten years old, so there is no question as to their reliability and wearing qualities.

From the discussion before the S. A. E. one would get the impression that air injection was detrimental to combustion, power output and economy. Not one of those points is borne out by facts.

A common method of clearing up the exhaust in Diesel operation is by raising the pressure of the injection air.

All experiments with solid injection (that have come to my knowledge) have shown a loss of power per unit of piston displacement and a loss in economy.

### Fuel Consumption Data

Makers of four cycle Diesel engines guarantee a fuel consumption of not over 0.45 lb. per b.h.p. at full load and not over 0.5 lb. per b.h.p. at half load. For small two cycle engines these figures are 0.5 to 0.6 lb. respectively. The thermal efficiency of the average engine in operation is 38 per cent as compared with the 30 per cent of the Hvid engine on a special test.

Compare the Hvid engine discussed before the S. A. E. with the Wisconsin Junkers 60-hp. marine engine. The latter has two cylinders 6 x 14 in. and operates at 400 r.p.m., each piston having a 7 in. stroke. The Wisconsin engine is rated at 3.06 ft.<sup>3</sup> per horsepower, giving a mean useful pressure of 75 lb. per in.<sup>2</sup> In practice it will probably do better.

The Hvid engine 5 1/4 x 9 in. developed 7 1/4 hp. at 300 r.p.m. on a special test. That figures out to 3.56 ft.<sup>3</sup> piston displacement or about 64.5 lb. per in.<sup>2</sup> mean useful pressure. Place the fuel consumption of the Wisconsin engine at 0.5 lb. per b.h.p. and show where solid injection has produced more power and better combustion.

Air injection does cause a slight refrigeration, but it is so slight as to be negligible. A glance at an indicator card will show that. The Diesel is the only combustion engine that gives a card approaching the ideal steam engine card. The injection air is so well mixed with the finely pulverized fuel that combustion takes place instantly. The fuel is burned just as it enters the combustion chamber, causing an even expansion instead of the explosion that takes place in other types of combustion engines.

I wish to submit a card taken from one of the engines in our station. You will note that the fuel has been burning as steadily as the flame of a blow torch during 22.5 deg. of the 27 deg. total opening of the fuel valve. That allows just 2.5 deg. for the opening and 2.5 deg. for the closing of the fuel valve. This steady complete burning of the fuel as it enters the combustion chamber accounts for the high economy of the Diesel. This high economy is not an occasional feature, under special conditions, but a reliable every day feature.

In gas, gasoline or surface ignition oil engines the ignition is started at from 17 deg. to 25 deg. and even 30 deg. before top center. The combustion begins with a slow burning and

ends in an explosion, causing a great rise in pressure. The Hvid approaches the Diesel cycle more nearly than the others, as the fuel is blown through small holes, by high pressure gas, in a more or less steady stream. Its lack of economy is probably due to the fact that the fuel is not so finely pulverized and is not mixed with air when it enters the cylinder.

Now for varying the speed of a Diesel engine. This can be done by varying the lift of the fuel valve with the fuel pump, without greatly injuring combustion. Marine engines must have variable speeds, and this feature has already been worked out.

*Indicator diagram from Diesel engine*

Data of machine from which card was taken: Three cylinders, 21 in. bore, 30 in. stroke. Speed, 180 r.p.m. Spring, 400 lb. p. in. Fuel valve opens 2.5 deg. b.t.c., closes 25 deg. a.t.c. Total opening, 27.5 deg.;  $\phi$ , 22.5 deg. Load, 500 hp. M.e.p. 84 lb. p. sq. in. M.u.p. 70.7 lb. p. sq. in. Pounds fuel per b.h.p. 0.42. Fuel B.t.u. p. lb. 18,984

Understand me, I am not knocking the Hvid engine. It is a wonderful little machine. Its test records show up much better than the oldest of its rivals, the surface ignition engine. It is certainly much simpler than any other combustion engine on the market. Diesel engines are too complicated and expensive to ever seriously compete with it in small sizes. The Hvid will hardly compete in sizes from 200 hp. up, the main field of the Diesel.

I'm wondering just why nobody builds a two cycle Hvid. If it is to be a factor in the automotive field the two cycle engine looks more promising than the four. It would weigh just a little more than half as much per horsepower and should give nearly as good economy. The two cycle should throttle better than the four cycle engine on account of the greater number of power strokes. The chief trouble in throttling a two cycle gasoline engine does not occur in injection engines. There is no carbureter and its attendant trouble making mixture.

## Improvement in Liquid Metal Spraying

IN a new adaptation of the Schoop liquid metal spraying process the metal stock used, instead of being melted by the oxy-hydrogen flame, is fused electrically, which is said to be both cheaper and better. The pistol apparatus is employed as before; but two ends of the wire are placed in the pistol, instead of one, and they are approached to one another as electrodes of an electric circuit. When the arc strikes, the wire fuses, and the electric current tears the fine metallic particles away. Zinc sprays in particular have been produced in this way. The electric heating may be simple, but the prevention of the oxidation of the sprayed metal will probably be as difficult as before.

## Maybach 300-Hp. Six-Cylinder Aircraft Engine

## [Principal] Specifications

Cylinder Dimensions, 165 x 180 mm.  
 Normal speed, 1500 r.p.m.  
 Brake m.e.p., 117.7 lb. at 1400 r.p.m.  
 Max. brake m.e.p., 120.5 lb. at 1200 r.p.m.  
 Compression ratio 5.95:1.  
 Crankshaft diameter, 66 mm.

Valve clear diameter, 48 mm.  
 Total weight of engine, 911 lb.  
 Weight per horsepower, 3 lb.  
 Piston speed, 1654 ft. per min. at 1400 r.p.m.  
 Mechanical efficiency (calculated) 86 per cent.  
 Brake thermal efficiency, 28.9 per cent.

# The 300-Hp. Maybach Aircraft Engine

Technical Description of the Largest German Aircraft Engine Model, Issued by the Technical Department of the British Air Ministry

Fig. 2—Cylinder and head

Fig. 3—Right hand side of Maybach 300-hp. engine

**T**HE general distinctive features of the design of the Maybach aero engines are as well known among aeronautical engineers in Great Britain as any of the enemy aero engines in service; firstly, by reason of the adoption of the old Wolsley-Maybach aero engines, the design of which was acquired before the war for airship work, and which was based on the design of the original Maybach engine; and, secondly, through the publication of the somewhat incomplete details of construction of the Zeppelin-Maybach engines and their installation, which were collected under great difficulties from the remains of the several Zeppelin airships brought down during the war.

These engines, in almost every case, were so badly damaged by fire that it was found almost impossible at the time to compile any really detailed report of their design, or of their power and general performance.

A new and more powerful type of Maybach engine is now being used in service by the enemy, which, according to French reports, develops over 300 hp., and which possesses great efficiency.

During the past few months several of the latest type of Rumpler machines have been captured fitted with the new 300-hp. Maybach engines.

The following report on the design of the 260-300 hp. Maybach engines is based on a detailed examination of engine No. 1261, taken from a Rumpler two-seater biplane (G.120), known as the C.4 type. This machine was brought down in France on Jan. 18, 1918, by a shot which perforated the carburetor and water pump. The machine was, unfortunately, completely destroyed by fire on landing, but the

engine was captured intact and little damaged. After slight repairs this engine has been put into running condition and tested for power, consumption, etc., at R. A. E. The results of these tests are given in the following report, together with metallurgical analysis and mechanical tests of materials and alloys used in the principal parts of the engine.

A complete list of the details of the design is given in the various data at the end of this report, including the percentages of weights of all parts, and the results of separate tests carried out on the carburetor and a new design of gasoline pump which is used in conjunction with the interesting high-altitude carburetors.

A brief description of the Rumpler C.4 and 5 type aeroplane in which these new 300-hp. Maybach engines are fitted will, no doubt, be of some interest here. Full details of this machine, however, have already been issued in a published report by the *Section Technique de l'Aéronautique Militaire*.

The Rumpler C.4 machine is a two-seater biplane, corresponding, more or less, to the D.H.4, and is generally fitted with a 260-hp. Mercedes engine. These machines are designed for long-range artillery reconnaissance and photography, and are armed with two guns—one Spandau fixed in front of the pilot's seat, firing through the propeller, and a swivelling gun mounted in the observer's seat behind. A two-bladed air screw is fitted, and a semicircular honeycomb radiator of unusual design is slung above the engine from the center section.

These machines are generally flown, according to report, at high altitudes—i.e., from 15,000 to 17,000 ft.—until over the lines, and from the French reports, the new 300-hp. May-

back engines are more flexible and regular in running than the 260-hp. Mercedes engines, and are generally preferred by the German pilots.

Compared with the 260-hp. Mercedes engines fitted in these machines, the new Maybach engines are credited with attaining an increase of 200 r.p.m. at altitudes above 2000 ft., and also possess greater efficiency in speed and climb in the Rumpler biplanes.

The total weight of the machine fully loaded is approximately 3439 lb.

#### General Features

The 300-hp. Maybach presents several unusual and interesting details, and as compared with the old 240-hp. Zeppelin-Maybach design, the new engines are undoubtedly a great improvement. The quality of the workmanship of every part, including the exterior finish throughout, is exceptionally good, and the working clearances are carried to very fine limits. Compared with any of the types of enemy engines, the workmanship is undoubtedly of a very much more finished nature; every part, nevertheless, shows the usual German characteristics of strength and reliability, combined with standardization of parts and ease of manufacturing, in preference to the saving of weight.

The general lay-out of this engine follows the usual German six-cylinder vertical type. The compression ratio is exceptionally high, viz., 5.94:1, which necessitates the use of very heavy pistons and connecting rods. In these particulars this engine follows the previous Maybach practice, but the adoption of a cast-iron floating bush in the little end bearing is an interesting development.

Four overhead valves per cylinder are fitted, i.e., two inlet and two exhaust. These are operated by rocker levers mounted on roller bearings in brackets fixed to the cylinder heads, as shown in Fig. 2, and by push rods on each side of the cylinders actuated by separate inlet and exhaust cam-shafts.

The camshafts run in plain bronze bearings in the crank-chamber, and lubrication is by splash.

Little alteration has been made in the design of the massive crankshaft, which runs on plain white-metal lined bearings throughout, and is provided with the well-known Maybach type centrifugal pressure lubrication system to the crank-pins, thence to the piston pins through small pipes inside the hollow connecting-rods.

The three separate and detachable gear oil pumps, which are situated in the bottom of the base chamber, are of new design.

The pump driving shaft at the front end is driven through a ratchet gear on the front scavenger pump, apparently with the object of preventing an air lock in the lubrication system in the event of back-firing.

A double-acting, oil-sealed gasoline pump of unusual design is now fitted. This is driven off an extension of the main oil pump spindle at the rear end of the base chamber, and works, of course, in conjunction with the two separate carbureters. These are of the well-known Maybach type, and have been only slightly modified. As shown in Fig. 3, they are attached, as in the Zeppelin engines, to the front and rear cylinder water jackets. A full description of the functions and workings of this interesting type of carbureter is given toward the end of this report.

The well-known Maybach induction type starting gear is fitted, but is slightly modified in design.

The whole of the induction system and the oil condensing crankcase ventilating system is an interesting point in the design of this engine, as is also the method of attaching the propeller-hub driving flange on the tapered front end of the crankshaft.

Practically no alteration has been made to the general design of the very simple and efficient type of water pump, which delivers directly into the bottom of the rear end carbureter water jacket as in the old Maybach engines. Ignition is by two Z.H.6 types Bosch magnetos, which are driven

Fig. 4—Showing water jacketing of valves

Fig. 5 (above on left)—Detail of jacket joint  
Fig. 6—Maybach cylinder and head, in section

directly off the rear ends of the camshafts; the position of the spark plugs in the cylinder heads is a point of interest dealt with in detail in the following description.

**Cylinders.**—In comparison with the Zeppelin-Maybach engines, the cylinders of the new 300-hp. Maybach engines are of very much lighter construction; and, as will be seen from the sectional drawings, are of a wonderfully clean design. Each cylinder shows practically a rectangular view from almost any point of view, with no excrescences or extensions. The whole construction of the cylinders, and particularly the formation of the cylinder head, presents many interesting details of design.

Referring to the sectional drawing, Fig. 6, it will be seen that each cylinder is built up of a thin steel barrel, machined and ground to 165 mm. bore, and machined on its outer surface to a thickness of 3 mm. The thickness is increased from 3 mm. at the bottom of the water jacket to 4.5 mm. at the cylinder base flange. Into the top of the cylinder barrel is screwed the cylinder head, which is of cast iron. A detailed sketch of this screwed joint is shown in Fig. 5. The screw thread, it will be noted, is 2.3 mm. pitch, buttress thread. A soft brass washer is fitted at this joint between the cylinder head and the top face of the threaded portion of the cylinder barrel.

The bottom of the cylinder barrel extends only 3.5 mm. below the base flange into the registering joint of the crankcase, and the bore of the cylinder is very little chamfered.

The design of the cylinder heads and the formation of the water passages round the twin inlet and exhaust valves is unusual, and the double inlet and outlet water connections between each pair of cylinders are of new design. The formation of these twin water connections is clearly shown in the detail sketch of the cylinder head (Fig. 4), together with the water passages cast round the spark plug bosses; the latter are somewhat inaccessibly situated in the space between the two cylinder head water joints. The two semicircular

Fig. 7—Piston and piston pin

Fig. 8—Connecting-rod

bosses which are cast on the sides of the cylinder water joints are provided for the attachment of the two carbureters, which are fixed to the front and rear cylinders by long studs screwed into these bosses in the water joints. To allow for the interchangeability of the cylinders, these holes are drilled in every cylinder; when the cylinder is not assembled at the front or rear, they are plugged with brass grub screws as shown in the sketch.

An interesting point of design in these cylinders lies in the fact that no water connections between the cylinders are made other than the twin head-joints referred to. (This principle is similar to that used in the cylinders of the Zeppelin-Maybach engines; these were provided with one large water joint, 5 in. in diameter, between each pair of water jackets, which was an extension of the cast-iron head. The cylinder barrels were also of cast iron, and were fitted with two inlet and three exhaust valves per cylinder.)

The exhaust valve pockets are provided with an additional water passage above the exhaust port, and cast so as to give a free water space completely round the center portion of each exhaust valve-stem guide.

The valve guides cast in the cylinder heads are fitted with cast-iron bushes pressed into position. The exhaust bushes do not extend the full length of the guides as the inlet does, but are kept back a distance of 10 mm. from the bottom of the guide, so that they are protected from the hot gases. As a further precaution against seizing, the diameter of the bottom of the exhaust bush is slightly reduced so that the bush has room to expand.

Contrary to the usual German practice of building up the

water jackets of sheet steel acetylene-welded at the joints, the water jackets are machined from cylindrical steel forgings, which, as shown in Fig. 5, are screwed on to the flange machined on the cylinder head; the pitch of this thread is 1 mm. This threaded joint is finally sweated in position with soft solder, the whole depth of the threaded portion having apparently been previously tinned; the joint is locked with four 6 mm. grub screws.

The whole of the water jacket is machined both on the inside and also on the outer surface to a thickness of 1 mm. The water jackets extend to 104 mm. from the base of the cylinders, or roughly to two-thirds of the total length of the cylinder barrels; but, as will be noted, the water space is exceptionally narrow—i. e., 7 mm.

The only water passages from the cylinder head to the annular water space of the water jackets are through the openings or passages cast in the cylinder heads encircling the spark plug bosses, and situated directly below the twin water connections. The formation of these water passages leading from the head of the jacket is made clear in the perspective sketch (Fig. 4).

The water jacket capacity of one cylinder = 1284 C.C.S.

Fig. 5 shows an enlarged view of the lower joint between the cylinder barrel and the water jacket. This joint consists of a soft rubber composition packing ring, compressed in position between two steel rings by a large ring which screws on to the bottom of the water jacket by a fine pitch thread in the manner shown in the sketch. This joint is, to a certain extent, flexible, and allows for the relative expansion between the cylinder barrel and the water jacket.

Small drain plugs are provided at the bottom of each cylinder water jacket; these are screwed into bosses welded into the water jackets on the exhaust side. The combustion chamber is circular, but it is slightly recessed below all of the four valve seats, which are all of the same diameter, i. e., 54 mm.

The area of both the inlet and exhaust ports is 30.15 sq. cm. = 4.66 sq. in.

The clearance volume of one cylinder = 778.9 cub. cm. = 47.54 cub. in., giving a compression ratio of 5.94:1.

Short pieces of aluminum tube are fitted over the top ends of the lugs in the cylinder heads forming the valve stem guides. These are shown in Fig. 6, and are apparently provided for lubrication purposes. Thin sheet steel plates are bolted to the inlet and exhaust ports of the cylinder heads to stiffen up the engine.

**Pistons**—Very little alteration has been made to the general design of the piston in comparison with the smaller Maybach engines. The pistons are of cast-iron, and weigh 12.3 lb. each, complete with rings. Four rings are fitted, all above the piston pin, the lower one being a scraper ring. All the rings are concentric, and are 6.5 mm. wide (vertically) and 5.5 mm. deep, the depth of the ring grooves being 6 mm.

The pistons, as will be seen in Fig. 7, are quite flat on both the top and bottom surfaces of the crown, which is 10.5 mm. in thickness. Eight 4 mm. return oil holes are drilled through the piston below the scraper ring in the usual way.

The rings are cut diagonally at 45 deg., no locating pegs being fitted; and the width of the ring gap in the cylinder is 1.39 mm. = 0.055 in.

All the piston rings are machine-hammered on their inner surfaces. This process, which is now extensively used, and is well known, consists of subjecting the inside face of the ring to a series of mechanical hammer blows at gradually increasing distances apart. The process shows a large number of small transverse depressions, extending nearly the width of the ring on the inner surface. These depressions caused by the hammer are approximately 1 mm. apart at the back portion of the ring, i. e., the part of the ring farthest from the gap—and increase in mathematical progression to about 4 mm. apart toward the front of the ring up to about 1 in., on either side of the gap. This mechanical hammering of the inside ring has the effect of giving the desired uniform pressure to the concentric ring against the cylinder wall.

The holes for the piston pin are bored eccentrically in the piston pin bosses, giving a thickness of metal of 14 mm. above and 9 mm. below the piston pin. An oil groove is cut in the piston skirt below the piston pin, evidently to assist

the scraper ring and the piston lubrication. The inside of the skirt is machined up as far as the bottom of the piston pin bosses, and a beveled lip is turned on the bottom flange of the skirt. The inside of the piston is also machined flat across the head, and down as far as the top of the piston pin bosses with 15 mm. radius; an annular rib is cast on the inside of the skirt to reinforce the piston bosses.

Other details of the design of the pistons are given in the section drawing Fig. 7.

**Piston Pins**—The piston pins are 159 mm. long, slightly beveled at the end, and are fixed in position in the piston by a single cheese-headed 9 mm. set screw in the usual way and locked with a split pin.

The piston pins are hardened and ground to three parallel outer diameters, being made of smaller diameter at one end than the other. The center portion which makes the small end bearings is 38 mm. diameter, and the two ends which fit into the piston pin bosses are 37.5 and 38.25 mm. diameter respectively.

The piston pins are bored 23 mm. diameter in the center, tapering to 28 mm. at each end.

Floating small end bushes are now fitted to the piston pin in the connecting-rod smaller ends. These floating bushes are made of cast iron of a very soft nature. The effective bearing length of the floating bushes is 93 mm., and their external diameter is 44.3 mm. For lubrication purposes a number of 4 mm. holes are drilled and countersunk on the outside.

The projected area of the small end bearing surface on the piston pin = 35.35 sq. cm., and the bearing surface in the connecting-rod small end = 39.9 sq. cm.

The weight of each piston pin = 1.75 lb., while the cast-iron floating bushes weigh 0.62 lb. each.

Details of the piston pins and the floating connecting-rod small end bushes are given in Fig. 7.

**Connecting-Rods**—Following the usual Maybach design, the connecting-rods are of square section beveled at the four cor-

ners, and bored up the center from the big end with a 28 mm. diameter hole, which is threaded and plugged, as shown in Fig. 8.

The big end bearing cap is secured by four 14 mm. bolts, which are threaded 1.5 mm. pitch into the top half of the connecting-rod big ends.

The inner surface of the big end bearing shells are machined with a screw-cutting tool which leaves a fine pitch screw thread.

No lock nuts are fitted to the big end bolts, but the square heads of the bolts are drilled, and prevented from becoming unscrewed when in position by a 4 mm. diameter pin, which is long enough to pass through the heads of each pair of bolts.

Two helical grooves 2 mm. wide are cut in the big end bearings. These oil grooves intersect each other on the center of the bottom half of the bearing, as shown in Fig. 8; the oil ways cut in the top half of the big end bearing metal are only taken half way on each side.

The little end floating bushes already referred to are lubricated by a 5 mm. steel pipe, which is fixed in the center of the hollow connecting-rods, and the holes drilled in the floating bushes communicate with helical grooves cut in the small end. An annular groove is cut round the center of the small end bearing, which communicates with the central oil pipe. The method of securing this oil pipe at each end inside the rod, and the steel disk, which supports the center of the oil pipe in the bore, are shown in the sectional drawing.

The total side clearance of the big end bearing between the sides of the crankwebs = 0.44 mm. and the float of the small end = 11.8 mm.

Total weight of the connecting-rod complete with floating bush = 8.93 lb.

Weight of big end = 5.625 lb.

Weight of little end = 3.305 lb.

Length of connecting-rod between centers = 310 mm.

(To be continued)

## Crane Hoist on Motor Truck

A NOVEL crane hoist, one of the first of its type to be mounted on a motor truck, has just been delivered to the U. S. Marine Corps by the Packard Motor Car Co.

The apparatus consists of a 10 ft. boom mounted upon a hollow steel mast. The hoist and slew, either to right or left, are operated from the Packard standard power take-off. This is manipulated by a hand lever in the center of the floor board within convenient reach of the truck driver. The radius adjustment of the hoist load is operated by a handwheel at the side of the driver's seat.

Two tons capacity is given at a 7½ ft. radius and 1½ tons at a 10 ft. radius. Two substantial ratchet jacks are mounted on the sides of the truck chassis to relieve the

frame from strains while the crane is in use. The truck in the illustration is a Packard standard 5-ton chassis, with 9 ft. 5 in. stake body and steel disk wheels, the entire outfit being painted the olive-drab of the Marine Corps. Two more Packards of 6-ton capacity each have been ordered by the Marine Corps, to be equipped with similar crane hoists.

# Twin Disk Clutch and Clutch Pulley

Specially Designed Tractor Components to Be Manufactured  
in Racine, Wis.—Features of the Clutch Are Its  
Floating Disks and Ease of Adjustment

**A**N interesting design of clutch specially adapted for tractor service is the Twin Disk. A sectional view and a rear view of the clutch are shown herewith. The clutch comprises one driving disk, which may be driven by means of four driving pins pressed into the flywheel web, and two driven disks, of which one is keyed to a clutch sleeve. Between the driving disk and the two driven disks there are disks of asbestos fabric, which latter are not fastened to any of the metal disks, but float between them. The driving torque taken by the

rearward driven disk is transmitted to the forward disk by means of four inner driving pins, pressed into the driven disk that is keyed to a clutch sleeve.

In drill holes of this latter disk midway between the inner driving pins are located four coiled springs which press the disks apart immediately the clutch is released. The various disks are pressed together for engaging the clutch by means of four clutch fingers which are pivoted on a four armed spider, screwed over the clutch sleeve. The clutch fingers are deeply carbonized and hardened, and they act against a hardened steel ring set into one of the driven disks. The clutch is engaged by pressing a steel cone between the ends of the clutch fingers.

A feature of the clutch is the ease with which adjustments can be made. This is accomplished by turning the four-armed spider on the clutch sleeve, after the spring-retained locking pin has been withdrawn. There is a circle of twelve equally spaced holes in the rearward driven disk for this locking pin, and very fine adjustments are therefore possible. These adjustments can be made without the use of tools, and even while the engine is running, though the latter procedure is not recommended.

This clutch can be secured to the flywheel without the use of cap screws; in fact no screws are used in the whole clutch, except when the latter is used in connection with a standard S. A. E. ring. In that case eight screws are used, to fit the regular tapped holes, and these screws hold the regular S. A. E. ring with the driving pins pressed into it. It is claimed for the clutch that it absolutely does not jerk, and that it has great pulling power. In substantiation of this latter claim it is stated that when mounted on a Wallis tractor, a three-bottom plow set to plow 8 in. deep could be started with the clutch pressed in with the little finger.

The illustrations show a typical mounting, the flywheel, driving pinion and bearings being, of course, no part of the clutch.

In addition to the clutch the Twin Disk Clutch Co. manufactures a clutch-pulley for tractors; that is to say, a combination belt pulley and friction clutch. In the majority of tractors the power for the belt drive is transmitted and controlled through the regular friction clutch which also controls the power to the driving wheels; but a few tractors, notably the Moline Universal, do not take the belt power through the regular clutch. It will be seen from the sectional view herewith that the clutch used in connection with the pulley is of the same type as that described above. The clutch is engaged by means of a steel cone, which is operated by a hand wheel containing a ball bearing, so that the operator may retain his grip of it whether the clutch is engaged or not. The same adjusting means is provided as on the larger diameter clutch. In

# What Langley Did for the Science of Aviation

Later Experiments with Quarter-Size and Man-Carrying Aerodromes Were But Partially Successful—No Sustained Flights Were Accomplished

## PART III

LANGLEY felt, when he had finished his work with models and had demonstrated the possibility of mechanical flight, that his work in the field was ended. He was tempted to proceed and to enlarge his efforts with a view to the construction of a man-carrying machine, but after careful consideration he decided not to do so. His original object had been to take up the subject of flight academically, to demonstrate that it was possible, and to determine and formulate the principles governing its accomplishment.

However, the natural desire to go on, coupled with the influence of pressure brought to bear upon him by some of those close to him, and more particularly by the Board of Ordnance of the United States Army, eventually induced him to undertake the construction of a machine capable of carrying a man. President McKinley was impressed with the possibilities of the flying machine as a military aid, and he, too, urged Dr. Langley to continue. He appointed a joint board of army and navy officers for the purpose of investigating and reporting on the plans which Dr. Langley had employed in obtaining flights with his models. This board returned a favorable report to the Board of Ordnance and Fortifications of the War Department, and Langley was formally requested to undertake the building and testing of a large machine, from which it was hoped to learn enough so

that a practical machine of military value might subsequently be constructed.

Even in the construction of small models, the matter of providing power plants which would generate sufficient power and not be of excessive weight had presented difficulties which were not easily surmounted. But Langley was able to overcome these difficulties by means which he clearly saw could not be employed on a larger scale to provide the necessary amount of power to drive the large plane contemplated.

It was also realized that there was small likelihood of finding the solution of the problem in any sort of a steam plant, and Langley was therefore forced to turn to the internal combustion engine, with which he had very little experience.

It was decided that a 12-hp. engine, which should weigh not exceeding 100 lb., was what should be obtained, and a contract was entered into with S. M. Balzer of New York in December, 1898, to build such an engine.

Langley did not feel that this would be of sufficient power to actually attain flight with a man-carrying machine, but he hoped with it to obtain results sufficient to furnish him with necessary data on such points as balancing and the best method of construction for a launching device.

In arriving at the size of the man-carrying machine,

*Engine used with the quarter-size model aerodrome. Cylinders were machined with integral radiating ribs, but, unfortunately, overheating continued*

*Three-quarter elevation of quarter-size model aerodrome. This is the type with "single-tier" wing surfaces which proved efficient but were not sufficiently strong*

the assumption was made that models Nos. 5 and 6, which, it will be recalled, were the most successful of the large number of models which Langley constructed, were capable "of transporting a load of approximately 10 lb. more than their weight." And, "since the supporting surface of any aerodrome," to quote from the Langley Memoir, "would increase approximately as the square of the linear dimensions, in order to carry a man the aerodrome would need to be approximately four times the linear dimensions of these models. Calculations based on the results accomplished in the construction of the models, indicated that such an aerodrome would need to be equipped with engines developing 24 hp. The best that could reasonably be hoped for was that these engines would not weigh over 200 lb., and, therefore, allowing 40 lb. for fuel and the fuel tanks, it becomes necessary to bring the weight of frame, supporting surfaces, tail, rudder, propellers and other accessories within 250 lb., if the total weight of the machine, including 150 lb. for the aeronaut, was not in excess of 640 lb., or 16 times the combined weight of the model and its load of 10 lb. Although the problem of constructing the frames, wings and other parts within the limit of 250 lb. seemed indeed formidable, it was believed that the greatest obstacle in the production of such a machine would be that of securing a sufficiently light and powerful engine at the period.

The work of constructing the frame and wings proceeded almost to completion before the engine was delivered. The contract called for the completion of the engine on Feb. 28, 1889, but after that date, and even into May of 1900, the builder was forced to make a continuous series of changes in it. He experienced almost endless trouble in getting it to function properly.

The engine was of the rotary cylinder type. Tests made by Charles M. Manly or Dr. Langley in New York, in the shop of the builders in May of 1900, disclosed the fact that it would develop only 2.83 hp. and that even this output could not be maintained for more than a few minutes. Later changes increased the output to 4 hp., but it became apparent that no better results were to be obtained, and that there was no hope of using this engine in the experiments with the man-carrying plane.

When the construction of the frame and wings had reached the point where it became necessary to have the engine on hand, and the completion of the engine was not yet in sight, Langley decided that it would be best

*Quarter-size model aerodrome in actual flight, August 8, 1903*

to construct a model on the exact lines laid down for the large machines, but of  $\frac{1}{4}$  size. With this model he hoped to obtain data regarding the relative positions of the center of pressure, center of gravity and line of thrust, to be used in checking the conclusions arrived at theoretically. It was also hoped that this quarter-sized model could be constructed and tested out without interfering with the progress of the construction of the large machine. It was decided to have an engine of about  $1\frac{1}{2}$  hp. constructed on lines exactly similar to those of the larger engine which was then being constructed.

Further difficulties in securing successful operation of the larger engine finally persuaded Langley not only to have both the large and the small engine built in the shops of the Smithsonian Institution, but also to lay aside work on the large machine temporarily until the quarter-sized model could be completed and tried out.

The difficulty in obtaining exact information and worthwhile outside assistance from those who knew more of the science than he did, were encountered by Langley when he attempted the construction of the gasoline engine as had previously been encountered in working out the steam power plants for the small models.

Charles M. Manly, who was then with Langley and in charge of the experimental work, in writing of the difficulties encountered, said:

"At the time that this engine was being developed, it was practically impossible to obtain any outside information regarding the proper way of constructing it. The little that was then known had been learned through laborious experience, and at great cost, by the experimenters who were attempting to build automobiles, and was zealously guarded in the hope of preventing their rivals from utilizing the results of their labor. It was the known custom, however, of all engine builders at this time to use a separate spark coil and a separate contact maker for each cylinder of an engine, no matter how many cylinders there were.

"This multiplication of spark coils, which at that time were very heavy, not only added greatly to the weight but also had the same defect that the wipe-spark type of sparking arrangement had of being exceedingly difficult to so adjust that all of the contact makers would perform their functions at exactly the same point in the cycle for each cylinder."

To obviate these difficulties, Mr. Manly devised what was at that period a new multiple-sparking arrangement whereby only one battery, one coil and one contact maker were used for causing the spark in all five cylinders at the proper time. This form of sparking arrangement worked so satisfactorily that it was adopted for the engine of the quarter-size model and also for a new and larger engine which was built subsequently. Almost insuperable difficulties were encountered in obtaining suitable coils, spark plugs and other parts as the development of electric ignition had not progressed to any appreciable extent, and such parts as were ultimately available were very crude productions.

As a result of unremitting effort and the utilization of some of the parts of the engine which had been condemned, an experimental engine for the man-size aerodrome, was actually running on Sept. 18, 1900. As the cylinders were not water-jacketed they were provisionally

cooled by wrapping wet cloths around them, a makeshift which proved sufficient to keep the engine cool for but three or four minutes as a maximum.

This short time was, however, sufficient to enable brake tests to be made, the brake hp. developed under these conditions being  $18\frac{1}{2}$  at 715 r.p.m. The engine, with the cloths, weighed 108 lb.

Of course the use of the wet cloths was but a temporary expedient, but the results proved so unsatisfactory it was decided to water-jacket the cylinders and test it out over more extended periods.

It proved impossible to braze the water-jackets directly to the cylinders and they were attached by means of stuffing boxes, a method which resulted in trouble from leaks, but when the work was done it was found that the engine developed  $21\frac{1}{2}$  hp. at 825 r.p.m., the total weight of the engine being 120 lb.

During the construction and testing of this engine it was proved that there were many parts which could be reduced in weight and for this reason it was decided to build an entirely new and larger engine and to install it in a man-carrying machine.

Before this point was reached in the development of the large model, as has already been intimated, the frame and wings of a quarter-size model were in course of construction. In originally planning this model the intention was to make all its linear dimensions exactly one-fourth of the large (or man-carrying) machine, but before the designs were completed it was realized that departures from the scale would be necessary both in the frame and in the propellers, which were increased in size to accommodate the engine and the lifting power. The frame, with these modifications, was completed in June, 1900, but no engine was ready.

As the result of much labor and the utilization of available parts from the small engine which the New York builder had failed to complete a reconstructed engine with stationary instead of rotating cylinders was produced. This developed, when working at its best, between  $1\frac{1}{2}$  and 2 hp., as measured by absorption dynamom-

Quarter-size model aerodrome equipped with superposed surfaces. Note the floats attached to the launching car. The plan of starting from the water does not seem to have been actually tried

*Man-carrying aerodrome on launching car with front wings in place and guy-wires adjusted. This machine made very brief flights on two occasions*

eters, but unfortunately it was found impossible to maintain this power steadily for more than 30 seconds. It was thought possible that by having everything ready for a flight the aerodrome might be launched before the cylinders began to heat seriously and thus the increased cooling caused by rapid motion through the air would enable a sustained flight sufficient to show whether the balancing was correct or not to be made.

Adhering to his theory that where a successful method of conducting an experiment has been discovered only after a long series of failures it is best to continue to use that method rather than to change to some untried plan, Langley decided to keep to his original plan of launching the aerodrome from the top of a houseboat, but in this instance he so far deviated from his rule as to construct floats which were to be attached to the launching car of the quarter-size model in such a way as to convert it into a catamaran raft. These floats are clearly shown in one of the illustrations. In the same photograph may be seen the superposed wing-surfaces which had proved stronger than the single-tier surfaces in the tests of models 5 and 6, referred to in part II of this series.

It was originally planned to use these superposed surfaces without guy-posts, but as it was found that in this case they would have to be made with rigid instead of hinged joints it was eventually decided to use the latter and retain the guy-posts.

After many delays, due to a variety of causes, the quarter-size model was tested from a houseboat on the Potomac in June, 1901. The launching equipment worked perfectly, the aerodrome started on an even keel straight ahead against a light wind. When it had traveled about 100 ft., however, it began to descend slowly, maintaining an even balance and finally touching the water about 150 ft. from the houseboat. The aerodrome was in the air for between 4 and 5 seconds. On a second trial, made when the wings had been dried, it traveled about 350 ft. in 10 seconds. It was considered that these tests, though disappointingly brief, showed conclusively that the balancing of the aerodrome was correct and it was accordingly returned to Washington for the purpose of making new cylinders for the engine.

The new cylinders were constructed from steel tubing finally  $\frac{1}{2}$  in. thick, machined with integral radiating

ribs and having combustion chambers screwed and brazed on. With these cylinders the engine was kept relatively cool, but the valves were so small that the gas could not get in and out rapidly enough to enable the engine to furnish full power. The addition of an auxiliary air valve did not improve matters so far as prolonged running was concerned, heating and premature ignition occurring after running about 2 minutes. Before overheating occurred the engine developed 3.2 hp. on the brake at 1800 r.p.m. and even reached 5.1 hp. for a few seconds when running at 3000 r.p.m.

These changes and repairs were completed by October, 1901, but nothing further was done with the quarter-size model until April, 1903. Instead, it was realized that work on the large man-carrying aerodrome was so much more important that the quarter-size model in its completed condition was put aside and the construction and testing of the new large engine for the man-carrying machine were proceeded with.

It was decided to employ steel wherever possible in the engine and this was done with all parts except the bronze bushings for the bearings, the cast-iron pistons and the cast-iron cylinder liners. Many difficulties were encountered.

The engine consisted primarily of a single crankshaft having a single crankpin, the shaft having bearings in a drum which consisted essentially of two heads. Arranged around the crankshaft and attached at equidistant parts of the drum were five cylinders. Innumerable troubles were encountered with overheating, ignition, etc., and were overcome in turn. The finished engine, with two flywheels and cooling water weighed practically 207½ lb. and in its second series of tests it developed 51 hp. at 935 r.p.m. At tests in preparation for St. Louis Exposition the engine was run on three separate trials for a period of ten hours with a constant load of 52.4 hp. at 950 r.p.m. These tests were continuous except for a ten-minute stop to renew the supply of lubricating oil and to change the sparking batteries. As a matter of fact it was not sent to St. Louis as the engine tests were abandoned owing to lack of competition. Further shop tests were made during 1902 and during the early spring of 1903.

On June 14, 1903, everything for the field test being

readiness, the houseboat was towed to its mooring buoy in the middle of the Potomac about 40 miles from Washington. The flying weight of the aerodrome was 830 including the weight of the venturesome airman, Charles Manly. The total area of the wings or supporting surfaces was 1040 sq. ft.

Many weeks of disappointing delay were caused by weather conditions, and it was not until Sept. 3 that it was considered feasible to make a test flight. On that day the metal frame of the aerodrome was hoisted to the top of the boat and placed on the launching car and wings, rudder, etc., made ready, but unfortunately the engine refused to start, owing to deterioration of the cells caused by damp weather, and it was necessary again to postpone the test.

It was also found that the glued joints in the cross-ribs of the large wings had been softened by the moisture from the fogs, and it became necessary to re-glue them and to bind the strips together with surgeons' tape. The guy-wires were readjusted to correct the warping of the wings.

### Actual Flight at Last

When hope of another calm day was almost abandoned, meteorologically ideal conditions came with Oct. 7, when the wind was blowing at the rate of about 12 m.p.h. The launching track pointed down the river, tugboats were in readiness to pick up the daring flier should he meet with an accident, and the aerodrome was then released down the sixty feet of track.

Mr. Manly, in describing his sensations, writes: "Just as the machine reached the end of the track the pilot felt a sudden shock, immediately followed by an indescribable sensation of being free in the air. This had hardly been realized before the important fact was intuitively felt that the machine was plunging downward at a very sharp angle, and he instinctively grasped the control which controls the Pénauud tail and threw it to its utmost extent in an attempt to depress the rear of the machine and thereby overcome the angle of the descent." Unfortunately Manly was unsuccessful in this, and, realizing he could not avoid a plunge into the river, he braced himself for the shock. The front wings were completely demolished as they struck the water, and Manly extricated himself from the machine by pulling himself up with the aid of the guy-wires. The aerodrome was rescued in a damaged condition, and inspection indicated that the primary cause of the failure was the fact that owing to the distortion of a metal cap on the front guy-post was not actually free from the launching car at the moment of starting, thereby causing the front edge of the front wings to be depressed and bend the metal framework.

*Dynamometer test of large engine for the man-carrying aerodrome*

Weather conditions continued to grow worse and storms interfered with the work, but eventually the houseboat reached Washington on Oct. 12 and the work of making the necessary repairs to the aerodrome was commenced.

Another attempt at flight was made on Dec. 8, when the river was studded with large blocks of floating ice. The wind was gusty, causing great delay in assembling the wings, and darkness was approaching before the actual attempt could be made. Unfortunately the flight was of brief duration, the aerodrome on leaving the track shooting upward in the air, assuming a vertical position with its bow upward, and then, being driven backward by the force of the wind toward the houseboat, where it turned over and came into the water on its back. Manly, who wore a cork-lined jacket which caught in the framework of the machine, had a narrow escape from drowning, but succeeded in freeing himself and getting to the surface, where he was picked up by a boat. The aerodrome was salvaged by tugboats, but was so seriously injured in the process that it was impossible to determine the precise cause of the accident.

Professor Langley at this point felt he could not approve of further expenditures from any Smithsonian fund, Mr. Manly's efforts to obtain financial assistance for purely scientific work proved unsuccessful, and for these reasons, and although success seemed about to crown the efforts of years, experiments were reluctantly abandoned. Langley, the genius who believed implicitly in the possibility of flight with a heavier-than-air machine, unfortunately did not live to see its accomplishment.

That Langley was fully justified in his faith in the possibility of flight in a heavier-than-air machine was demonstrated to the full seven years after his death, when his man-carrying aerodrome rose in the air, piloted by Glen H. Curtiss.

*(To be continued)*

*First of the two flights of the man-carrying aerodrome. Charles M. Manly was the pilot*

## Extension of the Aerial Mail Service

A MOST gratifying piece of news comes from Washington, namely, that immediately upon the conclusion of the war an aerial mail line will be established between Chicago and Denver, which may be extended to the Pacific Coast. From all reports the aerial mail service between New York, Philadelphia and Washington, which has now been in operation for practically half a year, has been an all-around success, and the only thing which prevents the immediate establishment of new lines is the inability to spare pilots and machines from the military establishment. But with the coming of peace this obstacle to the expansion of aerial mail service will be eliminated and the aircraft industry will certainly do its best to provide machines of the most suitable type, for the carriage of important mail matter is the most promising peace-time application of airplanes now in sight.

From Chicago to Denver is a distance of approximately one thousand miles, and at the same rate of speed as is maintained between New York and Washington should be covered in about 12 hr. The country between the two cities is for the most part level and makes for ideal conditions in aerial navigation. Difficulties will be encountered when it is attempted to extend the line from Denver west to the Coast, as then two mountain ranges will have to be crossed, but with the present development of aerial equipment these should not be a serious obstacle.

The Post Office is to be congratulated upon the success it has made of the New York-Washington line and the foresight it is showing in planning new lines at the present time for use at the end of the war, so that our aircraft industry may be switched from war-work to peace production with the least disturbance and at the same time the country's commercial interests may at the earliest possible time enjoy the advantages of high-speed aerial mail service.

## Encouraging Research Work

ONE effect of the war has been to bring strongly to public attention the great value of scientific and industrial research. It was the extensive research done by large firms in Germany that enabled that country to build up world-wide monopolies in such industries as aniline dyes, optical glass, etc. England previous to the outbreak of the war was dependent upon Germany for products of many kinds which were absolutely indispensable in warfare, and the awakening when it was realized that all sources of supply for these products had suddenly been cut off was a rather rude one. It was then realized that not sufficient attention had been paid to scientific work as related to industrial processes, and that if England wanted to maintain its position as a leading industrial country she would have to mend her ways. As a result, during the past two or three years British engineering papers have devoted much space to the subject of research, and especially to co-operative research by associations of firms in particular industries.

Research work is necessarily expensive, and only very large industrial organizations can afford to maintain a competent staff with proper equipment. Probably one of the reasons why England has lagged behind in this development is that the great majority of her manufacturing concerns are of moderate size. Naturally, all of the firms engaged in the same line of industry are confronted by much the same problems and if some of these problems can be investigated on a co-operative basis it will be of advantage all around. Heretofore industrial concerns have done their research and experimental work individually and have jealously guarded the results.

Strictly scientific research work has in the past been confined almost entirely to the universities, and it must be admitted that most of the great scientific discoveries have been made in university laboratories or at least by men connected with such insti-

tutions. Recently the complaint has often been made that the staffs of the universities, as a rule, are not in sufficiently close touch with practical developments to enable them to produce the results desired by the industries. They often pursue scientific work for its own sake and not because the results may be of practical value.

Government encouragement of scientific research is not by any means a new development, for such government-supported institutions as our own Bureau of Standards, the British National Physical Laboratory and the German Imperial Physical-Technical Institute have done much work that has been helpful in the development of industrial processes and products. During the war the activities of these institutions have been greatly extended, war requirements having made it necessary to get quick solutions of many important industrial problems. But instead of there being a let-up in this work at the close of the war, there will most likely be further expansion of it. Many industries that formerly were conducted by rule of thumb methods are getting onto a scientific basis and this will emphasize the need for research work.

The British scheme of industrial research associations provides for this. A fund of a million pounds sterling has been voted by Parliament from which grants will be made to such associations for work approved of by the Advisory Council on Scientific and Industrial Research. One of the great problems which will be attacked by one of these associations is that of a home produced motor fuel. The organization of the committee and the voting of the fund marks a step in government encouragement of industry of which we are likely to see much more after the war.

## Tractor Sizes

**I**NCREASING evidence is accumulating that the big demand in the tractor field in the future will be for a three-plow machine. There has been in the past a tendency to cut up farms into smaller ones, which was perhaps a direct result of the increase in population, but it is very much to be doubted whether this will continue if farming is revolutionized by the general adoption of power methods. This opinion is based not merely on theoretical reasoning but is supported by the experience of large numbers of tractor-owning farmers. A three plow tractor is the smallest size which is capable of delivering sufficient belt power for operating a separator, and this is a most important point, now that small "individual" threshers are rapidly ousting the large steam-operated custom outfits. Moreover, the three-plow tractor does so much more work than a two-plow horse outfit that the saving in operator's time is quite an item. Just at present the greatest inducement to the farmer in buying a tractor is the saving in manpower which it makes possible, and the three-plow is really the smallest outfit that affords an appreciable saving in this respect. Aside from the saving in operator's time there is undoubtedly a gain in mechanical efficiency because the two-plow trac-

tor, for instance, has to propel itself a 50 per-cent greater distance per acre plowed than the three-plow, and unless it weighs one-third less, which it seldom does, the energy spent in moving the tractor around the field is greater in the case of the smaller machine.

Every theoretical argument that can be advanced in favor of the three-plow machine, as compared with smaller ones, holds equally when applied to the four-plow, and where the farmer has sufficient acreage a four-plow and even larger outfit is advisable. But it appears from the testimony of farmers who have been using tractors that a three-plow outfit can handle the work of the average corn belt farm, of 160 to 320 acres, very well.

## "Rearing" of Tractors

**A** TRACTOR in its make up is very much like an automobile, only it is geared down much more, and consequently the force component of the power at the driving wheels is much greater and the speed component correspondingly smaller. Like all other machines of great weight and power, it involves certain dangers to the operator, and while in an automobile the risks of personal injury are intimately connected with the speed of the machine, in the tractor they are more related to the enormous torque impressed upon the driving wheels.

It has long been known that in a tractor, when the power is applied to the drive, weight is automatically shifted from the front to the rear wheels and the machine has a tendency to "rear." Under all ordinary conditions of operation the turning moment due to this torque reaction is not equal to the opposing weight moment around the rear axle, and there is no other result than that the steering may become somewhat erratic owing to the front wheels being pressed insufficiently against the ground.

However, in the case of extra hard pulls the forward part of the tractor may possibly "rear up," and such an occurrence naturally involves serious risks for the driver. The chance of rearing is closely connected with the distribution of weight and with the wheel base. It is less the greater the proportion of the weight that normally rests on the front axle and also the longer the wheelbase.

Rearing, of course, is also influenced by the hitch or drawbar attachment, for if the line of drawbar pull passes above the rear axle center line it tends to promote rearing, whereas if it passes below it tends to prevent it.

This question of the lengthwise stability of tractors demands the serious consideration of designers. It would be possible to provide safeguards, such as skids extending rearwardly and downwardly from the rear end of the frame. However, the provision of sufficient inherent stability by making the wheelbase fairly long and placing an ample amount of weight forward would seem to be preferable. A study of weight moment around the rear axle in tractors of different horsepower ratings should be profitable in this connection.

## Wright-Martin Earns \$540,678

Operations for 13 Months—  
Hispano Engine Production  
to Be 750 Per Month

NEW YORK, Oct. 31—The Wright-Martin Aircraft Corp. made net profits of \$540,678 during the 13 months ending June 30, which is looked upon as a substantial profit in view of the fact that the company's operations in the 7 months from May 31 to Dec. 31, 1917, showed a deficit of \$189,000. In the following 6 months, however, net profits were \$729,678, wiping out the loss and making a net profit for the period as given. The report points out that because operations are on a cost-plus basis it is difficult to show the amount of gross business in a given period.

During this 13-month period practically the entire resources of the company have been used to produce Hispano-Suiza engines for the United States Government. About a year ago the production of Simplex automobiles was discontinued and this work will not again be taken up until after the war. An order for 450 Hispano-Suiza engines for the French Government was completed about a year ago and since July, 1917, the company has received orders from the United States Government for 7500 engines of the same general type to be produced at the New Brunswick plants and for 5000 of the new 300-hp. engines to be produced in another factory prepared at the expense of the Government. Including the original French order, the company has produced approximately 4000 engines with spare parts. At present the output of the New Brunswick plants is about 600 engines per month, and it is estimated that the maximum output of 750 per month with spare parts will be reached early in 1919.

"For the production of the new 300 hp. engine," says the report, "the Government has provided the company with the use of the factory previously owned by the General Vehicle Company at Long Island City, N. Y. These facilities have been very much enlarged and equipped with thoroughly modern machinery. The tooling is now nearly completed for the initial deliveries which will start at an early date, and the volume of production from this factory will reach large proportions by the summer of 1919. These facilities have been provided entirely at the expense of the Government and are its property.

"In addition to these two factories, exclusively operated upon Hispano-Suiza motors, the Pierce-Arrow Motor Car Company of Buffalo, N. Y., has been sub-licensed at a reasonable rate of royalty to produce a considerable number of the 300 hp. motors for

the United States Government. The greater part of the facilities of the H. H. Franklin Manufacturing Co. of Syracuse, N. Y., will also be engaged in making parts for these contracts as a sub-contractor.

"In order to obtain the output of 150 hp. and 180 hp. motors required, extensive additions to the company's factory at New Brunswick have been necessary. The last of this development work will be completed by December of this year and will provide one of the best equipped aeronautical motor factories in the world. When this work is completed, the company will have a plant investment of something over \$5,500,000, made up of about \$2,000,000 pre-war plant and the remainder of increased facilities provided for the performance of these contracts. The contracts with the Government provide for either special depreciation or liquidation of such increased facilities, so that when final adjustments under the company's contracts have been completed the company will not be burdened with an undue plant investment.

"The company's interests are also adequately protected in the event of any or all of these cost-plus contracts being cancelled.

"After the period of experimental development on the 150 hp. motor had been passed, the company set up as a deferred charge a reasonable portion of the cost of this development which it is absorbing at the rate of \$180 per motor." All directors were re-elected.

### To Make Airplane Parts

DETROIT, Oct. 29—The newly incorporated B. & H. Machine Products Co., 1161 Ellery Street, will confine its efforts to government machine production work entirely, manufacturing parts essential to airplane and truck engines.

## American Exporters Convene

Building Up of Foreign Trade  
Requires Education, Financial  
Help and Advertising

NEW YORK, Oct. 31—The necessity for proper and adequate financial assistance, the need of thorough education both of foreign buyers and those who come in contact with them, and the value of systematic advertising were the keynotes of the ninth annual convention of the American Manufacturers Export Association which opened here yesterday. The gathering was one of the largest in the history of the organization, nearly 1500 delegates being in attendance. For the first time the meeting was thrown open to the general public, having heretofore been closed to members of the association.

Questions of adequate financial assistance are paramount in the opinion of Lewis E. Pierson, president of the Irving National Bank, who presided at one of the sessions; and most important under this subject comes the more general use of the trade acceptance.

"We all realize that the demands of the future will require that national resources be kept in a most highly available condition," said Mr. Pierson, "but at the same time we continue the employment of commercial credit practices, among which the open account is a conspicuous illustration, which in their operations tend to render a large portion of these resources unavailable for the business purposes they are supposed to serve, while the acceptance method, of obvious merit in this connection, only during the past year has been able to demand serious consideration from American business and finance."

Foreign trade will never be built up to assume proportions which will insure American leadership without proper education, according to W. W. Nichols of the Allis-Chalmers Mfg. Co. Mr. Nichols said in part:

"It requires no argument to prove that the kind of farm trade which the U. S. establishes will depend upon the character of the education it employs in cultivating ideas and creating a wise appreciation adequate to an enterprise of such moment to the welfare of the nation. Education should be divided into two parts: The education of public opinion from its birth comes foremost because public opinion will shape all federal legislation to make or break our enterprise. And second, the peculiar education of the individual whose life work will be foreign trade."

"Unless a firm is prepared to set aside a certain sum of money for export advertising, map out some kind of a plan to spend it, and then go ahead and spend it, the matter is better left alone," said David L. Brown, manager of the Goodyear Tire & Rubber Co.

# Automotive Industries

## Can Sell Parts for Repairs

### War Industries Board Permits Sale When Used for Passenger Cars

WASHINGTON, Oct. 31—Following conferences here between members of the automobile industry and the War Industries Board, the board has decided that regardless of pledges exacted from electrical and ball bearing makers to sell their products to essential consumers only, manufacturers will act within the meaning of the pledge if they sell the parts to dealers and jobbers to be used for the repair and maintenance of passenger automobiles.

The conference was held because many manufacturers who had signed the pledge felt that it would be a violation of it to sell parts for the up-keep of passenger cars which are not on the essential list. The decision of the War Industries Board stating that Class C priority will be provided for parts for the repair and for replacements on passenger cars removes the restrictions from manufacturers and they may now make sales accordingly. In answer to a request that priority also be given to materials to be used in making repair parts for passenger cars, the board stated that since current requirements are being cared for, it would prefer to take the matter up at a later date prior to Jan. 1, 1919.

The conference with the board was preceded by a meeting of the various representatives of the industry at the National Automobile Chamber of Commerce offices in Washington, which was attended as well as the War Board conference by:

Hugh Chalmers, Detroit, vice-president, National Automobile Chamber of Commerce; Alfred Reeves, Washington, general manager, National Automobile Chamber of Commerce; Sidney F. Beech, Chicago, president National Association of Automobile Accessory Jobbers; N. H. Oliver, Chicago, Manufacturers' Division, National Association of Automobile Accessory Jobbers; F. W. A. Vesper, St. Louis, president National Automobile Dealers' Association; Bart J. Ruddle, Milwaukee, National Automobile Dealers' Association; C. E. Thompson, Cleveland, vice-president, Motor and Accessory Manufacturers' Association; J. G. Utz, Cleveland, Motor and Accessory Manufacturers' Association.

Automobile taxes and the possibilities of passenger car production after Jan. 1, 1919, were also discussed at the N. A. C. C. offices and will be taken up again in

the near future. Following are the decisions of the War Industries Board in complete text:

1. We have considered your suggestion provision be made for giving a degree of preference for materials for making repair parts for passenger automobiles in service, in addition to the provision which has been made for passenger automobiles and repair parts pursuant to letter of the War Industries Board of date, Aug. 24, 1918.

2. This division is advised by the Automotive Products Section that your current requirements of materials for repair parts are being taken care of, and that being so, this division would prefer not to change the current arrangement until the expiration of the period covered by the letter.

3. Prior to Jan. 1, 1919, you are invited to take the matter up again with this division and at that time, war conditions permitting, we will endeavor to give a degree of preference to you for materials to take care of repairs for all cars in service from that date forward.—Rhodes S. Baker, Assistant Priorities Commissioner.

1. We have given consideration to the matters which you have brought up relating to repairs to passenger automobiles and repairs and replacements to equipment to same.

2. Supplement No. 2, issued Oct. 15, 1918, to Circular No. 4, issued July 1, 1918, by this division, among other things provides Class C priority rating "for all necessary repairs to equipment, vehicles, implements and machinery of every nature whatsoever."

3. This division rules that repairs to passenger automobiles and replacement of parts, material and equipment therefor are included in the foregoing language; and that the making of repairs to such automobiles and the furnishing of parts, material and equipment to repair same is authorized.—Rhodes S. Baker, Assistant Priorities Commissioner.

### American Exporters Convene

(Continued from page 768)

"An appropriation for a given period of time and a schedule, are just as important abroad as they are in this country."

George Edward Smith, Royal Type-writer Co., was elected president, other officers elected being: vice-presidents, William Ingersoll, Robert Ingersoll & Bros.; H. L. Willson, Columbia Graphophone Co.; J. S. Lawrence, Lawrence & Co.; Julius Goslin, Joubert, Goslin Mfg. Co.; George H. Meyercord, Meyercord Co. Directors: H. S. Demarest, Greene, Tweed & Co.; F. S. Seiberling, Goodyear Tire & Rubber Co.; F. A. Taylor, S. S. White Dental Mfg. Co.; C. K. Anderson, American Wire Frabric Co.; J. A. Farrell, U. S. Steel Corp.; E. M. Herr, Westinghouse Electric & Mfg. Co.; A. C. Bedford, Standard Oil Co.; W. W. Nichols, Allis-Chalmers Mfg. Co.; W. C. Durant, General Motors Export Co.; W. L. Saunders, Ingersoll, Rand Co.; R. A. Shaw, National Aniline Chemical Co.

## Nation's Fuel Supply Adequate

### Fuel Administration States There Is More Coal Stored Than at Any Previous Time

WASHINGTON, Oct. 29—The nation's fuel supplies, assembled in preparation for an unusual winter, are adequate and well distributed, according to a statement made to-day by the Fuel Administration. Continued economy, however, will be necessary.

More domestic coal is in the hands of consumers at present, says the statement, than at any corresponding period of the previous year. The upper Great Lakes districts, which usually suffer from coal shortage, have received the greatest proportionate supplies, and all sections of the country, in fact, are stocked up with more coal than at the corresponding period in pre-war years.

### Expect to Save 50,000,000 Tons

Twelve million seven hundred thousand tons have been saved for war purposes by curtailment of less essential industries. For the first half of the coal year it is expected that 50,000,000 tons will be saved during the entire year.

"The Fuel Administration," stated Dr. Garfield, "approaching the winter season, was organized with stocks of coal on hand far in excess of stocks of other years. We are ready for an unusually severe winter, but we are still and shall continue to be dependent upon the co-operation of the people of the United States in conserving fuel, and upon the several agencies concerned in the production and transportation of fuel to enable us to carry through our program to the end of the year."

### Oil Shortage Caused by Overseas Demand

The oil situation, according to the report, will be somewhat acute this winter owing to the steadily increased domestic and overseas demands. Stocks on hand show 6,000,000 gal. of gasoline and naphthas and 9,400,000 gal. of kerosene for Sept. 1, 1918, as compared with 6,025,000 gal. of gasoline and naphthas and 11,600,000 gal. of kerosene on hand Sept. 1, 1917.

The solution of the oil problem is one of transportation. Tank ships are scarce and existing pipe lines are operating at capacity. Additional pipe line capacity is being built in Texas, but the transportation of this oil to the North Atlantic ports from the Gulf ports involved additional tank steamers which are not now available.

# Set Standards for Women Workers

## War Labor Policies Board Establishes Rules Governing Employment—Equality of Wages With Men and One Day Rest in Seven Required

WASHINGTON, Oct. 28—Labor standards for women engaged in war work have been established by the War Labor Policies Board. They include stipulations for 1 day rest in 7, 8-hour working days, equal wages with male workers, sanitary working conditions, one-half holidays on Saturdays, regulations for hazardous work and methods of employment of women. The standards are based upon past experiences observed by the board and are closely in accord with recommendations issued early in the war by the Quartermaster Department. All contracts of the federal departments will hereafter, by direction of the War Labor Policies Board, contain clauses requiring full compliance with State labor laws. Officials of the State Labor Department in each State will be deputized by the heads of the contracting departments of the Federal Government to co-operate with federal agencies in enforcing these provisions of the contracts. Following is the summary of the required standards:

### B. STANDARDS RECOMMENDED FOR THE EMPLOYMENT OF WOMEN.

#### 1. Hours of Labor

1. **Daily Hours**—No woman shall be employed or permitted to work more than 8 hours in any one day or 48 hours in any one week except that in cases of emergency women may work overtime provided that the total working day, inclusive of overtime, shall not exceed the legal working day in the state and shall never exceed 10 hours as a maximum, and provided that the total working week, inclusive of overtime, shall not exceed the legal working week in the state and shall never exceed 55 hours as a maximum. The time when the work of women employees shall begin and end and the time allowed for meals shall be posted in a conspicuous place in each room and a record shall be kept of the overtime of each woman worker.

2. **Half Holiday on Saturday**—Observance of the Saturday half-holiday should be the custom.

3. **One Day of Rest in Seven**—Every woman worker shall have one day of rest in every seven days.

4. **Time for Meals**—At least one-half hour shall be allowed for a meal if the working day is 8 hours or less. If the working day is longer than 8 hours at least three-quarters of an hour shall be allowed for a meal.

5. **Rest Periods**—A rest period of 10 minutes should be allowed in the middle of each working period without thereby increasing the length of the working day.

6. **Night Work**—No woman shall be employed between the hours of 10 p. m. and 6 a. m. unless the plant holds a special certificate issued for this purpose by the Secretary of War or the Secretary of the Navy with the approval of the Secretary of Labor.

#### II. WAGES

1. **Equality With Men's Wages**—Women doing the same work as men shall receive the same wages with such proportionate increases as the men are receiving in the same industry. Slight changes made in the pro-

cess or in the arrangement of work should not be regarded as justifying a lower wage for a woman than for a man unless statistics of production show that labor cost of the job in question is higher when women are employed than when men are employed. If a difference in cost is demonstrated the difference in the wage rate should be based upon the difference in production for the job as a whole and not determined arbitrarily.

2. **The Basis of Determination**—The minimum wage rate should cover the cost of living for a family and not merely for the individual.

#### III. WORKING CONDITIONS

1. **Comfort and Sanitation**—State labor laws and industrial codes should be consulted with reference to provisions for comfort and sanitation. Washing facilities, with hot and cold water, soap and individual towels, should be provided in sufficient number and in accessible locations to make washing before meals and at the close of the work day convenient. Toilets should be separate for men and women, clean and accessible. Their numbers should have a standard ratio to the number of workers employed. Workroom floors should be kept clean. Dressing rooms should be provided adjacent to washing facilities, making possible change of clothing and the care of clothing outside the workrooms. Rest rooms should be provided. Lighting should be so arranged that direct rays do not shine into the worker's eyes. Ventilation should be adequate and heat sufficient. Drinking water should be cool and accessible with individual drinking cups or bubble fountains provided. Provisions should be made for the workers to secure a hot and nourishing meal eaten outside the workroom, and if no lunch rooms are accessible near the plant, a lunch room should be maintained in the establishment.

2. **Posture at Work**—Continuous standing and continuous sitting are both injurious. A seat should be provided for every woman employed and its use encouraged. It is possible and desirable to adjust the height of the chairs in relation to the height of machines or work tables, so that the worker may with equal convenience and efficiency stand or sit at her work. The seats should have backs. If the chair is high a foot rest should be provided.

3. **Safety**—Risks from machinery, danger from fire, and exposure to dust, fumes or other occupational hazards should be scrupulously guarded against by observance of standards in State and Federal codes. First aid equipment should be provided.

4. **Uniforms**—Uniforms with caps and comfortable shoes are desirable for health and safety in occupations for which machines are used or in which the processes are dusty.

#### IV. HOME WORK

1. No work shall be given out to be done in rooms used for living or sleeping purposes or in rooms directly connected with living or sleeping rooms in any dwelling or tenement.

#### V. EMPLOYMENT MANAGEMENT

1. **Hiring, Separations and Determination of Conditions**—It has been demonstrated that the most effective results in the relationship between a company and its employees depend upon a personnel department

charged with responsibility for selection, assignment, transfer or withdrawal of workers and the establishment of proper working conditions. This is especially important at a time when the withdrawal of men for military service necessitates changes in personnel, including the more extensive employment of women.

2. **Supervision of Women Workers**—Where women are employed, a competent woman should be appointed as employment executive with responsibility for conditions affecting women. Women should also be appointed in supervisory positions in the departments employing women.

#### VI. CO-OPERATION OF WORKERS IN ENFORCEMENT OF STANDARDS

1. The responsibility should not rest upon the management alone to determine wisely and effectively the conditions which should be established. The genuine co-operation essential to production can be secured only if definite channels of communication between employers and groups of their workers are established. The need of creating methods of joint negotiation between employers and groups of employees is especially great in the light of the critical points of controversy which may arise in a time like the present. Existing channels should be preserved and new ones opened if required, to provide easier access for discussion between an employer and his employees.

#### VII. INTRODUCTION OF WOMEN INTO NEW POSITIONS

1. **Analysis of Occupations**—When the introduction of women into new positions is contemplated, each occupation in the plant should be carefully analyzed to determine whether women may be employed under existing conditions or what changes should be made to adapt it to women. This analysis should show what the job is, what it requires of the workers in strength, nervous energy, posture, skill and education, what the working environment is and what hazards can be eliminated or reduced. Attention should be centered especially on the following conditions which would render the employment of women undesirable if changes are not made:

- A—Constant standing or other postures causing physical strain.
- B—Repeated lifting of weights or other abnormally fatiguing motions.
- C—Operation of mechanical devices requiring undue strength.
- D—Exposure to excessive heat, that is over 80 degrees; or excessive cold, that is under 50 degrees.
- E—Exposure to dust fumes or other occupational poisons not inherent in the essential nature of the processes.
- F—Isolation employment or conditions involving moral hazard.

2. **Selection of Workers**—When the occupations have been selected in which it is desirable to introduce women, the selection of workers best adapted to these occupations through physical capacity, experience and other qualifications is as important as the determination of the conditions of the work to be done.

3. **Training**—Opportunities for training should be provided, since experience shows that the employment of women without preliminary training results in high labor turnover and reduction of output.

#### VIII. CO-OPERATION WITH OFFICIAL AGENCIES

The United States Government and State and local communities have established agencies to deal with conditions of labor, including standards of working conditions, wages, hours, employment and training. These should be called upon for assistance, espe-

cially in the difficult problems of adjustment brought by war conditions with the resulting necessity for greatly extending the employment of women.

Inquiries regarding the employment of women may be addressed to the Woman in Industry Service, Department of Labor, Washington, D. C., and these will be dealt with directly or referred to the official Federal or State Agency best equipped to give the assistance needed in each instance.

### Searching for Oil Pools

WASHINGTON, Oct. 28—The Mid-Continent, Texas, Gulf Coastal Plain and Wyoming regions are regarded as containing the greatest number of undiscovered oil pools in this country by the United States Geological Survey, Department of the Interior. In Wyoming the survey is mapping out anticlines and domes that probably contain oil, and the land in these areas will be opened to prospecting as soon as the bill before Congress providing for the leasing of such lands in the public domain is passed.

In the Mid-Continent field the Osage Reservation in Oklahoma is said to give promise for rapidly increasing the available oil supplies of the country. Examinations in this region by the survey are nearing completion and show the presence of many untested anticlines and domes, most of which will be found to contain commercial deposits of oil. Many good pools have already been developed in this section, but not half of the reservation has yet been leased for oil, and more than 1,160,000 acres belonging to the Indians remain to be opened. The Office of Indian Affairs is arranging to lease this land for development.

### Copper Price Unchanged

WASHINGTON, Oct. 28—The President has approved an agreement made between the copper producers and the War Industries Board that the maximum price of copper will be continued at 26 cents per pound, taking effect Nov. 1, 1918, and subject to revision after Jan. 1, 1919. This price is f.o.b. cars or lighters at Eastern refineries, f.o.b. cars or lighters at Pacific Coast refineries for Pacific Coast destinations, and f.o.b. cars or lighters at New York for shipping to Eastern or interior destinations from Pacific Coast refineries and from refineries in the interior of the United States. All shipments made after Jan. 1, 1919, are subject to any change in price taking effect after that date as made by the Price Fixing Committee of the War Industries Board. The maximum price of 26 cents is subject to the additional changes on copper shapes approved by the Price Fixing Committee on June 5, 1918.

### Chicago Office for "Kepuruber"

CHICAGO, Oct. 28—The Rubber Preserving Co., manufacturer of "Kepuruber," a liquid to prevent the deterioration of tires and other rubber articles, has established sales offices at 752 Otis Building, Chicago.

## Government's Prices for Trucks

### Complete List of Contracts Placed for "B" Trucks and "A" and "B" Bodies

WASHINGTON, Oct. 25—Following is the complete list, together with prices paid, of orders placed by the Quartermaster Department for class B trucks, class A truck bodies and class B truck bodies. In each contract on the B trucks the Government furnished the eleven major units:

#### B Trucks—Chassis

United Motors Co., Grand Rapids, Mich., 500.....	\$892.00
Signal Truck Co., Detroit, 500.....	960.00
Vim Motor Co., Philadelphia, Pa., 500	1,069.83
Winthrop Motor Truck Co., Winthrop Harbor, Ill., 500.....	1,147.50
Brookway Motor Truck Co., Cortland, N. Y., 1000.....	1,137.00
Denby Motor Truck Co., Detroit, 1500	1,132.57
Lewis Hall Iron Works, Detroit, 500.....	1,137.00
Republic Motor Truck Co., Alma, Mich., 2000.....	1,138.00
Bethlehem Motor Truck Co., Allentown, Pa., 1500.....	1,162.50
Diamond T Motor Car Co., Chicago, 2000.....	1,150.00
Rowe Motor Mfg. Co., Lancaster, Pa., 500.....	1,200.00
J. C. Wilson Co., Detroit, 500.....	1,200.00
Sterling Motor Truck Co., Milwaukee, Wis., 750.....	1,187.50
Indiana Motor Truck Co., Marion, Ind., 1500.....	1,162.50
Clyde Cars Co., Clyde, Ind., 500.....	1,200.00
Maccar Co., Scranton, Pa., 500.....	1,200.00
United States Motor Truck Co., Cincinnati, Ohio, 1500.....	1,162.50
Gramm-Bernstein Motor Truck Co., Lima, Ohio, 2000.....	1,500.00
Service Motor Truck Co., Wabash, Ind., 750.....	1,187.50
Standard Motor Truck Co., Detroit, 750.....	1,187.50
Atterbury Motor Car Co., Buffalo, N. Y., 750.....	1,187.50
Midland Motor Truck Co., Oklahoma City, Okla., 500.....	1,200.00
Velle Motor Corp., Moline, Ill., 2000.....	1,150.00
Selden Motor Truck Co., Rochester, N. Y., 2000.....	1,150.00

#### Class A Bodies

	Prices include troop seats and export crating.
Auto Body Co., Lansing, Mich., 3000.....	\$112.75
Dort Motor Car Co., Flint, Mich., 1000.....	135.50
Hercules Buggy Co., Evansville, Ind., 2000.....	143.00
Mitchell Motors Co., Racine, Wis., 1500.....	143.00
Grand Rapids School Equipment Co., Grand Rapids, Mich., 1500.....	143.00
International Harvester Co., Chicago, 2000.....	143.00
Glascock Bros. Mfg. Co., Muncie, Mich., 1500.....	143.00
Kuhlman Car Co., Cleveland, Ohio, 1000.....	143.00
Field Mfg. Co., Owosso, Mich., 500.....	143.00

### Immense Store of Manganese Ore

WASHINGTON, Oct. 26—More than 250,000 tons of manganese ore has been located by experts of the United States Geological Survey, Department of the Interior, in Jackson County, Oregon. The Survey has been examining deposits of manganese and manganiferous ores in various parts of the United States for the last two years, because of the limitation of shipping facilities which has reduced manganese ore imports from all sources other than the West Indies and Central America in 1918 one-third below those of 1917. There is a prospect that there will be further import limitations imposed in 1919.

The importation of the iron-manganese alloy ferromanganese has decreased in greater proportion and will probably soon be stopped entirely. To offset this decrease of manganese deposits in this country and the West Indies the Geological Survey has been examining them with the view of determining the availability of the ore. Domestic producers responding to the increased demand have raised production from 27,000 tons in 1916 to 116,000 tons in 1917 and it is probable that production in 1918 will be 185,000 tons.

Investigations in Oregon show the manganese oxides in quantities ranging from 15 per cent to 52.8 per cent in the ore collected in Jackson County. Car samples of two shipments of the concentrate ran 47.5 and 48.5 of manganese and assays of other samples of concentrates are reported as follows:

	Gold	Silver	Iron	Manganese	Phosphorus
1.....	0.08	11.1	1.2	52.5	0.09
2.....	.08	14.5	1.4	46.5	.207
3.....	.16	11.15	.9	52.8	.174

About 1500 tons of ore containing at least 15 per cent of manganese is "in sight." In addition, incomplete prospecting by drilling and by open cuts indicates that at least 4 acres are underlain by 10 ft. of ore, about 120,000 tons, containing probably 10 per cent of manganese. The surface indications in other parts of the district warrant an estimate that they may yield 130,000 tons of ore carrying at least 10 per cent of manganese, so that the probable reserves of ore of this grade amount to more than 250,000 tons.

Manganese is one of the vitally important metals used both for war and non-war work. In the form of ferromanganese it is alloyed with steel to make manganese steel and the manganese dioxide is used in the manufacture of dry batteries. More than 95 per cent of all the manganese consumption in this country, however, is used principally in making all Bessemer and open-hearth steels, in which it is incorporated in the form of iron-manganese alloys, which serve as deoxidizers and purifiers of the molten metal.

The Lake Creek district of Jackson County, Oregon, where the greatest deposits have been found, has just lately undertaken the mining of manganese.

## Fiat Develops Worm-Drive Tractor

Four-Wheel Machine with Four-Cylinder Vertical Engine of Standard Type—Design Built Around Three Main Castings—Motor Car Construction Closely Followed

By W. F. Bradley

*Fiat kerosene farm tractor showing the use of three main castings and the elimination of any frame. The engine is an exceptionally clean design. The power pulley is at the rear end of the gearset*

**TURIN, ITALY**—Special Correspondence—It is an open secret that numbers of European automobile concerns will jump into the tractor field as soon as circumstances permit. The first to come out openly in this line is the Fiat Co. of Turin, whose production will be examined with interest not only on account of its intrinsic merit, but because the firm back of it has secured the position of the biggest purely automobile factory in Europe.

In laying out this tractor, the Fiat company appears to have been governed by

local conditions, which are of a most diversified nature. These run all the way from immense plains with hardly a pimple on them to little patches of land on the mountain side only accessible with great difficulty by anything on wheels.

The machine is of the four-wheel tractor type, with motor in front, front end suspended, rear end without springs and drive to the rear wheels by means of overhead worm and live axle. One of the outstanding features of this machine is that there are no frame members. Instead there are three main castings: an

upper and lower half engine base, and a combined clutch, transmission and rear axle housing, this latter being bolted to the former, thus making what is virtually a one piece housing for the entire power plant and transmission.

The motor is the Fiat 3½-ton truck type, and although interesting, there is nothing new in its design, for it is a type which has been built in thousands for trucks supplied to all Allied armies. The cylinders are a 4-cylinder monobloc L-head casting of 100 by 180 mm. (3.9 by 7.08 in.) mounted on a horizontally divided cast-iron base. The magneto is driven off a transverse shaft, with the pump at the opposite end of the same shaft. Big aluminum inspection plates are bolted on the sides of the basechamber. Lubrication is under pressure to the three main bearings, the connecting rods and the wrist pins.

The carburetor is a Fiat type, as used on the trucks, bolted up to the right side of the cylinder casting and delivering its mixture through an integrally cast manifold. All the air is drawn in through the valve stem chamber, which is enclosed and fitted with wire gauze strainers for the admission of air. A special heating apparatus is fitted to the carburetor, enabling it to handle kerosene, which is the fuel generally used.

Gasoline is employed for starting only, and the small gasoline tank is carried inside the main kerosene tank mounted on the metal dash. A centrifugal governor limits the motor speed to 1100 r.p.m. Cooling is by means of a tubular radiator with bolted together header and base tanks; the cooling is assisted by a four-blade belt-driven aluminum fan.

In the second housing, which is bolted up to the engine basechamber, are contained a multiple disk clutch, the worm and sector steering gear, a three speed and reverse selective transmission and finally an overhead worm and worm wheel. The upper portion of this housing over the clutch, steering gear and transmission is removable for inspection purposes. Although one and the same casting, the rear axle housing is divided

*The single casting which serves to house the transmission mechanism, rear axle and steering gear*

*Rear axle, drawbar attachment and arrangement of the power pulley on the Fiat agricultural tractor*

Permanent adjustable jack for removing one rear wheel to expose the power pulley

Type of easily adjustable disk clutch used on the Fiat tractor

horizontally, the lower portion, which is attached to the upper by a series of bolts, being removable without in any way interfering with the axle. This gives complete accessibility to the worm wheel and the drive shafts. On the top of the housing there is an inspection cover immediately above the worm.

The rear wheels are built-up metal type of 51 in. diameter by 12 in. in width attached to the drive shafts by cone and key and made detachable. At the extremity of the worm shaft there is a 14-in. diameter pulley, with face width of 6½ in. This also serves as a brake drum with internal shoes. The big diameter wheels makes it impossible to use the drum. Thus a permanent adjustable jack is mounted under the axle, and after this has been lowered one of the wheels is withdrawn, making the pulley available for belt connection to any stationary machinery.

Spherical ball bearings are employed in the transmission, while the rear axle shafts are carried in bronze bushes, the lubrication of the entire rear axle being by pressure from a pump driven off the worm wheel.

The front of the tractor is suspended by a transverse inverted semi-elliptical spring. Automobile type steering is made use of, as on Fiat trucks, with the transverse tie bar in front of the axle. The only peculiarity is that the steering gear is inside the clutch housing. No wood is made use of in the construction of the tractor. There is a single seat, spring mounted on a steel column; ignition point is fixed, and throttle control is on one side of the metal cowl surrounding the fuel tank. The only instrument is a pressure indicator for the oil mounted on the top of the dash.

Rear wheels have a diameter of 51 in. and are fitted with detachable strakes. As these wheels are detachable, it is interesting to note that they weigh 600 lb. each, with the strakes. The front wheels, which are of same type as those at rear have a diameter of 32 in. and a width of 5 in. Total weight of the tractor is 5300 lb. Its maximum speed is 3.7 m.p.h.; on second gear speed is 2.1 m.p.h., and on bottom the tractor makes 1.2 m.p.h.

This tractor has already been submitted

to public trials in Italy, where it gave a very good account of itself. It operated on very heavy ground with three plows at an average speed of 2.4 m.p.h., when the average tractive effort was 2600 lb. On a very difficult portion of the ground the tractive effort was increased to 4600 lb. without the tractor showing any inclination to stall. The rate of plowing was 4550 sq. yd. per hr. to a depth of 7.8 in. Hauling an Osborne reaper and binder the tractor traveled at the rate of 3.7 m.p.h. and covered an area of 8370 sq. yd. in the 60 minutes.

#### Republic Truck Earns \$985,084

ALMA, MICH., Oct. 28—Earnings of the Republic Motor Truck Co. for the year ending June 30 were \$985,084; the Torbensen Axle Co. earned \$368,218 in the same period. These figures are after setting aside \$900,000 for excess profits and income taxes. Net sales of the Republic company totalled \$20,522,380, with manufacturing costs \$17,749,549, leaving a gross profit of \$2,772,831. The net profits, before deduction for taxes, amounted to \$1,485,083. Torbensen net sales were \$4,828,216 and the manufacturing costs \$3,750,012, leaving gross profits of \$1,064,115. The net profit before deductions for taxes was \$768,219.

#### Flies 4000 Miles in Zigzag Course from Gulf to Great Lakes

WASHINGTON, Oct. 29—Four thousand miles in the air in a zigzag course from the Gulf to the Great Lakes is the distance traveled by an Army flyer from Ellington Field near Houston, Texas, to Mt. Clemens, Mich. and return. The total hours of actual flight was 64. Nine days elapsed from the time he left Ellington Field until his return. Lt. John E. Davis was the pilot and he made the trip alone without mechanic and without changing plane or engine. He carried an extra gasoline tank in his plane, making the total capacity 50 gal.

Starting Friday at 1 p. m., Lt. Davis made Dallas for the night. From Love Field, Dallas, he flew to Memphis. Sunday at 8 p. m. he made Indianapolis by following the Mississippi north to St. Louis and swinging east by way of Springfield and Rantoul, Illinois. Here he was forced to take the ground in the dark without landing lights. The next morning he flew to Cincinnati and the day following to Mt. Clemens, Mich., by way of Dayton.

# Switzerland Has 6140 Vehicles

More Than Half Are Imported  
—Of Total, 4934 Are Cars  
and 1206 Trucks

NEW YORK, Oct. 7—At the end of 1917 there were 6140 motor vehicles in Switzerland, of which number 4934 were touring cars and 1206 motor lorries. Of the total, 2565 motor cars were of Swiss origin and 3575 were imported vehicles.

According to these statistics, for which the Automobile Club of Switzerland is responsible, there were 15 motor car firms in the Helvetic confederation. The number of foreign makes represented in that country is 43. The foreign firm having the largest number of cars in service in Switzerland is Fiat with 283 touring cars and 15 motor lorries. Although it is an Italian firm which heads the list with a big margin, France is first in the list of nations, with Germany second, America third, Italy fourth, and Belgium fifth. British built cars are not listed separately.

The following are the detailed figures, showing the number of cars according to make and country of origin:

## MOTOR VEHICLES IN SERVICE IN SWITZERLAND AT THE END OF 1917

## Exports to Russia

WASHINGTON, Oct. 19—Applications will now be considered by the War Trade Board for the exportation of all commodities to Russia. A limited amount of cargo space will be available for shipments from the Pacific Coast direct to Vladivostok, and in allocating the space preference will be given to material covered by licenses issued on and after October 7, 1918, under conditions which the War Trade Board in Washington will define and discuss with exporters. Due consideration will be given to each particular transaction. In order to facilitate the consideration of applications, exporters are requested to state definitely on each application if the material is made up and ready for shipment and if so, its present location.

## U. S. Wants Tire Tape

WASHINGTON, Oct. 25—The Post Office Department has asked for bids for ½-in. tire tape in ¼-lb. rolls for use on Government-owned motor trucks. If the price does not hold good for the present fiscal year, the bidder is required to state the period of time it will hold good.

## Cleveland Galvanizing Changes Name

CLEVELAND, Oct. 30—Chain Products Co. is the new name of the Cleveland Galvanizing Works Co. There have been no changes in the personnel or management of the company.

# Petroleum Products Exports

September Figures Show Increases in All Items Except Lubricating Oil

WASHINGTON, Oct. 28—A study of the figures covering exports of petroleum products for the month of September last and for the nine months ending September of this year indicate a steady increase both in quantities and values, with the solitary exception of a slight reduction in the quantity of lubricating oil shipped abroad.

Taking the entire group of mineral oils as a unit, our exports for September, 1918, show an increase of 31.4 per cent as compared with September, 1917. Comparing the respective values, the increase is much more marked, it being no less than 80.2 per cent for the period in question.

A comparison of the exports by groups for the 9 months ending September, those for this year show substantial increases both in quantities and values.

Taking the gasoline and naphtha group alone for this 9-months period, the 1918 figures show an increase of 44.4 per cent in quantity and 64.9 per cent in value. Although the quantity of lubricating oil exported shows a slight reduction, its value for the 9 months of 1918 has increased by over 46 per cent.

## Bus Line for Tokio

TOKIO, JAPAN, Aug. 15—An extensive motor bus service is to be started in Tokio by Dec. 1 for both freight and passenger traffic. Eventually the service will be maintained by 180 passenger cars, each carrying 16 persons, and by fifty motor trucks for freight. The passenger fare will be 4½ cents with an extra half cent for transfers if needed. The route of the motor bus system will follow the principal street car lines of the capital of Japan. The company announces it is planning to buy the initial fleet of motor buses from American manufacturers by Oct. 1. Later the company will build its own buses at Tokio.

## Exports of Petroleum Products for Nine Months of 1918

	SEPTEMBER		NINE MONTHS ENDING SEPTEMBER

## Plan Chicago-New York Airplane Mail Service

WASHINGTON, Oct. 28—The New York-Chicago air mail route will start between Dec. 1 and Dec. 15, according to an announcement made here by Postmaster General Burleson. The city of Cleveland has established Woodland Hills Park as the air mail field and will construct a hangar costing \$10,000. Chicago has given the use of Grant Park as an aviation field, and the Aero Club of Illinois has tendered the use of Ashburn Field for hangars, workshops and bunk houses for the mechanical forces. The Chicago Association of Commerce has appropriated \$15,000 for the construction of the air-mail hangar. Bryan, Ohio, the intermediary stopping point between Chicago and Cleveland, has furnished the Post Office Department with suitable ground and hangar.

The New York-Chicago route will be laid out in 3 legs, the first from New York to Bellefonte, Pa., a distance of 215 miles, with an emergency station and machine midway at Lehigh; the second leg from Bellefonte to Cleveland, a distance of 215 miles, with an emergency station at Clarion, Pa., a distance of 87 miles from Bellefonte; the third leg from Cleveland to Chicago, a distance of 323 miles, with an intermediate mailing station at Bryan.

The plan of operation during the unfavorable winter months contemplates the airplanes leaving Chicago and New York at 6 o'clock each morning, with a capacity of about 20,000 letters, and making the trip, including all stops, within a period of 10 hours.

### 103 Planes Bomb Los Angeles

WASHINGTON, Oct. 28—One hundred and three airplanes leaving March Field, Riverside, Cal., in battle formation made a flight of 160 miles without accident. This large squadron bombed Los Angeles with Liberty Loan literature. The total mileage of the trip was 16,000, made without a fatality or the loss of a plane. Accompanying the air fleet was a hospital plane and another plane carried an official photographer, who made moving pictures while en route. This is the largest number of planes that ever visited an American city. All of the planes were of the Curtiss JN-4D training type. Approximately 3000 gal. of gasoline were consumed.

### Chicago-Denver Airplane Mail

WASHINGTON, Oct. 25—The aerial mail service operated by the Post Office Department will be extended immediately after the war to include a route between Chicago and Denver, with a possible extension to San Francisco.

### Five Aviation Fatalities

WASHINGTON, Oct. 28—During the week ending Oct. 19 there were reported five fatalities in aviation training fields in the United States. Two deaths oc-

curred at Payne Field, West Point, Miss., and there was 1 each at Carruthers Field, Benbrook, Tex.; Langley Field, Hampton, Va., and Post Field, Fort Sill, Okla. There were no deaths from flying accidents reported from any of the other 23 fields. Each death represents 3544 hours of flying, or 283,620 miles of air travel.

### Godman Field in Kentucky

WASHINGTON, Oct. 28—The aviation field at Camp Knox, Stithon, Ky., has been named Godman Field in honor of First Lieutenant Louis K. Godman of the Air Service, who was killed in an airplane accident recently.

### Hendee Profits \$645,225

NEW YORK, Oct. 28—During the fiscal year ending Aug. 31 the Hendee Mfg. Co., Springfield, Mass., earned undivided profits of \$645,225, as against \$1,142,250 during the previous year. At the same time good will, which last year was capitalized at \$8,300,000, is this year put down for \$7,000,000. Following is the condensed balance sheet comparing last year with this year:

Assets		1917	1918
Real estate, buildings, etc. ....	\$1,546,483		\$1,556,944
Good will .....	8,300,000		7,000,000
Investments .....	908,766		670,816
Inventories .....	2,562,718		3,083,085
Due from customers...	758,885		1,017,968
Due from branches....	102,729		234,380
Cash .....	171,100		171,127
	\$14,350,676		\$13,734,320
Liabilities		1917	1918
Common stock .....	\$10,000,000		\$10,000,000
Preferred stock .....	2,200,800		1,845,700
Due to trade creditors.	607,257		854,255
Pay roll accrued.....	35,652		54,057
Reserve for taxes, etc.	64,717		51,450
Reserve for pref. stock.	300,000		102,683
Undivided profits .....	1,142,250		645,225
Notes payable .....			180,950
	\$14,350,676		\$13,734,320

### Fordson Distributors Organize

PROVIDENCE, R. I., Oct. 28—The Fordson distributors of the United States are banded together in the Fordson Distributors Association of America, with headquarters of the organization in this city. The object of the association is to promote the interests of those concerned. The organization was formed in Des Moines in July. The officers are: President, Clyde L. Herring, Herring Motor Co., Des Moines; treasurer, Thomas J. Northway, Rochester, N. Y.; secretary, Harvey J. Flint, this city.

### Revoke Tin Import Licenses

WASHINGTON, Oct. 25—Licenses heretofore granted for importation of tin have been revoked by the War Trade Board and all future imports will be granted only on licenses issued to cover shipments consigned to the United Steel Products Co.

## Glenn Martin Develops 180-M.p.h. Bombing Plane

WASHINGTON, Oct. 28—A bombing plane designed by Glenn Martin which is said to have developed a speed of 180 m.p.h., is receiving the attention of both the Senate Military Affairs Committee and the Bureau of Aircraft Production. This plane was mentioned in conference between the members of the War Department and the committee late last week. There have been rumors here that there was a new high-powered plane designed, and that it would supersede the Handley-Page and Caproni in our program. Although the report of a new plane has been confirmed in the acknowledgment that Mr. Martin has designed one, nothing definite can be learned at this time regarding its superiority over the Caproni or Handley-Page.

At the conference between the War Department and the committee officials it was said that the Caproni had passed the various tests satisfactorily. The committee was also informed that 2000 airplanes have been shipped to France.

### Department of Labor Wants Cars

WASHINGTON, Oct. 28—The Department of Interior asks for bids for three 5-passenger cars. Bids should be submitted to the United States Indian Service, Rosebud, South Dakota, before Nov. 6, 1918. Illustrations should be submitted with full specifications, and each bid amounting to more than \$500 must be accompanied by a certified check or draft equal to 5 per cent of the amount involved.

### Shipping Mobile Laundry Units

WASHINGTON, Oct. 28—Twenty-six mobile laundry units have been shipped overseas and manufacturers are now making shipments at the rate of about four per week. Each mobile laundry unit consists of a steam tractor, four trailers which carry the laundry machinery and equipment, and one supply truck. The steam tractor hauls the laundry unit to the point where it operates and then furnishes steam and power for the four trailers, which constitute the laundry. The arrangement of the units permits their disassemblment and movement to a new location 30 minutes after the laundry ceases to operate.

### Complaints Against Accessory Concerns

WASHINGTON, Oct. 25—The Federal Trade Commission has issued complaints against the Baltimore Hub-Wheel & Mfg. Co. and the Holland-Baden-Ramsen Co., both of Baltimore, because, according to the complaint, these concerns for more than 2 years have "sought to induce and compel manufacturers to refuse to recognize certain competitors as jobbers or wholesalers and as entitled to the benefit of jobbers' or wholesalers' prices and terms. The concerns were cited to appear before the commission at Washington Nov. 29.

# Aeronautical Experience Will Profoundly Affect Motor Car Practice

President of British Institution of Automobile Engineers Predicts No Return to Pre-War Designs—Necessity for Greater Standardization and More Research Work Paramount

LONDON, ENGLAND, Oct. 3—Special Correspondence—Predicting that the automobile industry will never return to a pre-war basis, President A. A. Remington, of the Institution of Automobile Engineers, prophesied at the last meeting of that body that, without doubt, the valuable aeronautical experience which manufacturers have had as a result of the war will have a profound effect on automobile design after the war. There will be great changes in our automobile factories, and whereas the technical man in the engineering industry heretofore has been subordinate to the equivalent commercial man, it seems likely that these positions will be almost completely reversed.

Standardization and the necessity for a greater amount of research are of vital importance, stated Remington, and urged that the following researches be undertaken:

1—An investigation to establish the most economical application of the laws relating to conductivity, heat transference and diffusivity, as affecting motor car radiators, so as to enable the smallest or lightest radiator for a given case, to be determined, including amongst suitable proportions for the provision of air draft, the most suitable rate of air draft and the rate of flow of the water.

2—An investigation to determine the factors making for comfort in suspension—including inter-relations between such factors, as

a—Vertical periodicity of the front and rear springs respectively in relation to each other.

b—Rolling periodicity.

c—Pitching periodicity.

d—Metacentric height.

e—Wheelbase.

f—Weight distribution.

"It can now be seen that the war will vitally affect the conditions of industry in almost every direction," said Mr. Remington, "and it is impossible to think that at the end of the war, when our normal industry is reorganized, I might almost say re-started, we shall revert to pre-war ideals and methods, either in connection with commerce, manufacture or design. Much has happened during the course of the war to change our ideas on those, in common with other subjects, and without doubt the automobile industry will with most industries, and, in fact, it is to be hoped, with the country and the world in general, ultimately reap much benefit from these changes in idea and method.

"At times we hear the suggestion that no one will be able to afford motor cars after the war, and this argument is so persistently advanced that one is sometimes tempted to wonder what degree of truth there can be in such a statement. The motor car has long since developed from being solely a vehicle of sport, and

while it still suffers under the undesirable name of 'pleasure car' it is now recognized on all sides as essential means of transport for passengers as the lorry or motor van is for goods.

"After the war we shall doubtless suffer from severe taxation and high cost of living, but as the automobile is a time-saver, it seems that the adverse conditions of life will accentuate rather than diminish the necessity for it, and it will be more than ever a necessity and money-maker. Therefore, although high cost of living will mean high costs both for material and labor, the motor car business must and will flourish notwithstanding.

"The question of the types of vehicle for which there will be a market will have to be carefully considered; undoubtedly there will be in the future a market, and a large one, for the cheap car, but in the automobile industry, as in every other branch of life under normal circumstances, a man gets what he pays for; therefore, as long as proper value is given for money, as we have seen that there will be a big demand for cars for all purposes, it follows that there must be a market for every class of vehicle for which there was a market before the war. Naturally there may not be a market for the same proportion of vehicles in every category as there was before the war, but it will be necessary for the industry in organizing itself to proportion its output as a whole in such a manner that it will meet the needs of the buyers; a statement that is easily made, but it will probably involve a lot of hard thinking and possibly some bitter experiences, before the industry will have so adjusted itself to meet the needs of the public.

"It yet remains to be seen to what extent it will be policy for the automobile engineer to take advantage of his aeronautical engine experience. We are all aware that the aeronautical engine has a much higher mean effective pressure, higher mechanical efficiency and lower specific fuel consumption than even the most advanced pre-war automobile engine, but the requisite characteristics for the two classes of work are so different that while aeronautical engine experience can with advantage be used to some considerable degree in the automobile engine, it is difficult to say just how far results will warrant this utilization.

"But in my opinion much of the aeronautical engine experience that has been gained by our automobile engineers during the war will be found to have a profound effect on their post-war automobile productions, and an examination of the extent of this effect, when such a

course becomes possible, will be extremely interesting. I am looking forward to great strides in the development of automobile efficiency (using the term efficiency in its broadest sense of meaning more useful for its ultimate purpose) as a result of the war experience of British automobile engineers.

"In the past the technical man in the engineering industry has always been subordinate to the equivalent commercial man, perhaps because it was supposed that the technical knowledge could be obtained from books, whereas so-called commercial knowledge was composed of some indefinable sort of rare instinct coupled with experience; but it is not difficult to discern that the change is taking place, and it is certain that in years to come the technical positions will cease to be subordinate in the same way as formerly. The application of more and more science to all branches of business, by increasing the necessity for scientific knowledge, will render such knowledge more general; also in future the workshop trained man who has had no real scientific training will, because of the more general existence of scientific knowledge, no longer be able to pose as scientific. The requirements of the higher positions on the scientific side of industry will necessitate the employment of many more highly-trained scientists to fill them, and it is to be hoped that ultimately all management positions in our engineering industries will be filled by men possessing scientific knowledge as well as business experience.

"The war has been the means of causing almost every British pre-war motor car factory to be greatly enlarged, and it is therefore to be expected that after the war the output of each factory in this country will be greatly increased, and this will mean that greater standardization will not only be possible, but profitable. It is therefore highly desirable that we should all, in our mutual interests, do everything we can to forward the work of standardization for the automobile industry.

"It is probable that the examination of post-war models will, as previously referred to, show that the motor car engine has absorbed a lot of the practice that has been developed for the immediate advantage of its sister—or shall I say child?—the aeronautical engine. It must be considered, however, that the requirements of the aeronautical engine, apart from the necessity for lightness, partake more of the character of the marine than of the motor car engine, although the development of power-weight ratio in aeroplanes, resulting in more rapid climb and greater altitude with its consequent reduction in atmospheric pressure, now practicable for regular flying, is bringing the conditions of operation of the aeroplane engine into closer analogy with the conditions that obtain for the motor car engine."

The Crompton medal, which is awarded annually by the institution for the best paper, has been awarded to Major H. P. Philpot for his paper on "Some Experiments on Notched Bars."

## Bituminous Output Affected by Epidemic

Both anthracite and bituminous coal suffered a setback during the week ended Oct. 19, owing to the epidemic of influenza in the mining regions. The 11,523,000 net tons of soft coal produced in the week under review, though 800,000 net tons behind the output of the week ended Oct. 12, exceeded by 1,300,000 net tons the production during the same period of 1917. Reports show that influenza caused a decrease in the shipments of soft coal from all fields except western Pennsylvania. The epidemic has not helped the anthracite situation. Production of hard coal during the week ended Oct. 19 totaled 1,715,000 net tons compared with 1,955,000 net tons the preceding week. The total output of anthracite from April 1 to date is estimated at 57,573,000 net tons, as against 56,736,000 net tons for the same period of 1917.

Though the country as a whole is rather well supplied with bituminous coal, the necessity still exists for the exercise of the strictest economy. The quantity of anthracite distributed so far this year to those sections which are permitted to burn hard coal is greater than in normal

years. The demand for domestic sizes, however, shows no signs of a let-up.

Prepared sizes of anthracite, such as egg, stove and chestnut, are scarce. Many consumers have been advised to purchase the smaller sizes, and mix it with the larger grades. The small sizes of anthracite are plentiful and several shippers have been cutting the prices to move surplus stock.

Summed up concretely, the coal situation can be said to be generally satisfactory. There is no prospect of a serious shortage in bituminous, and the belief is expressed that domestic consumers will receive their share of anthracite before November closes.—*Coal Age*.

## Build Experimental Ruby Tractor

EAU CLAIRE, WIS., Oct. 28—The United States Switch Co., Eau Claire, Wis., manufacturing automatic railroad signals and switch units and motor railroad tractors, is completing work on an experimental model of a large farm tractor for the Ruby Tractor Co., Minneapolis. The tractor will weigh about 7 1/2 tons, a single casting used in its construction weighing 1671 lb.

## Federal Taxicab for Washington

WASHINGTON, Oct. 28—A federal taxicab service under the operation of the Motor Transport Corps will be inaugurated here this week for the special benefit of army officers. It is designed to facilitate the transportation of officers between the various Government departments, to expedite Government business and at the same time to save money.

## War Service Members Meet

WASHINGTON, Oct. 28—More than 300 industrial war service committees will meet at Atlantic City Dec. 4, 5 and 6, under the auspices of the War Service Executive Committee, Chamber of Commerce of the United States. The meeting will bring together about 3000 industrial leaders to discuss industrial war problems. A more centralized scheme of organization will be one of the topics.

## La Crosse Tractor Price Advances

LA CROSSE, WIS., Oct. 31—The price of the La Crosse Happy Farmer tractor has been advanced from \$975 to \$1,150, the new price to be effective Nov. 1. This applies to both the models, F and P

**Sheldon Building New Shop**

NEW YORK, Oct. 28.—Rapid progress is being made in the erection of the new Sheldon all steel and concrete, two-story machine shop which is expected to increase production at least 30 per cent. The floor area will be 85,152 sq. ft., which is about twice the floor space of the present machine shop. It is expected that the new building will be completed by January 1, and partly in operation about the same time as the machinery is being installed as the building is being erected. Only machining of axle parts will be handled in the new building.

**Templar 90 Per Cent War Work**

CLEVELAND, Oct. 25.—The Templar Motors Corp. is at present on a 90 per cent war basis, manufacturing a large order of 155 m.m. shells. The company is producing a few cars each month, and has enough material on hand to build several hundred more cars. The Templar plant is being greatly enlarged by the addition of two more stories on the present building, which is 500 by 72. This is in addition to several smaller one-story buildings, and when completed will triple the capacity of the plant

**McDole Increases Capacity**

KALAMAZOO, MICH., Oct. 25.—C. B. McDole is preparing to increase the capacity of his sheet metal plant by the installation of another large press, also other equipment for the manufacture of automobile truck fenders. In addition to the large orders already secured, he has also been urged to bid on several contracts for the Emergency Fleet Corp.

**To Make Propeller Material**

HAYWARD, WIS., Oct. 28.—The American Veneer Co. has been organized at Hayward, Wis., with a capital stock of \$100,000, and will erect and equip a new plant for the manufacture of airplane veneers, propeller material, gun stocks and similar hardwood products for military and naval purposes. George C. Glover, head of the Willow River Lumber Co., Hayward, is president and general manager of the new concern.

**Matthews to Make Propellers**

MILWAUKEE, Oct. 28.—The Matthews Bros. Mfg. Co., 65-75 Fourth Street, Milwaukee, a large maker of office furniture and interior finish, has been awarded a Government contract for 200 airplane propellers of a new type and for 25 pontoons for seaplanes.

**To Train Tractor Operators**

MADISON, WIS., Oct. 28.—A special course of training in farm tractor construction, maintenance and operation will be given Dec. 2 to 21 by the agricultural engineering department of the University of Wisconsin at Madison. The course is open to women as well as men, and no limit of age will be set. The number of students in the three weeks' course is limited to 50, and as indications already are that there will be an overflow, it is

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

planned to repeat the course early in January. The course will be directed by F. W. Duffee and E. C. Suave, and tractor men of national reputation will give lectures.

**Exportation of Second-Hand Articles**

WASHINGTON, Oct. 28.—On and after Nov. 1 applicants for licenses to export second-hand articles composed of iron or steel will be required to state on Form X that the commodity to be exported is "second-hand." Failure on the part of the applicant to describe second-hand material as such will be regarded as an inaccurate description of the goods and the applicant will be subject to the prescribed penalty therefor.

**Canadian Johns-Manville Company**

MONTREAL, Oct. 23.—The Canadian Johns-Manville Co., Limited, has been formed here with a capital stock of \$2,500,000.

**Capital Increases**

The Lansing Forge Co., Lansing, Mich., has increased its capital stock from \$100,000 to \$300,000.

The American Machine Products Co., Detroit, has increased its capitalization from \$10,000 to \$40,000.

**Dividends Declared**

National Acme Co., Cleveland, quarterly cash dividend of 1½ per cent (or 75 cents a share), payable Nov. 30.

Cleveland Automatic Machine Co., Cleveland, a dividend of 1½ per cent on common stock, par of which is \$50, payable Nov. 26.

Pressed Steel Car Co., Cleveland, quarterly dividend of \$2 a share on the common stock, payable Dec. 4; also regular quarterly dividend of \$1.75 on preferred, payable Nov. 26.

Auto Investment Co., Detroit, initial dividend of 4 per cent, payable Nov. 1.

Michigan Drop Forge Co., Pontiac, has declared the monthly dividend for October of 15 cents per share and an extra dividend of 10 cents per share on common stock.

**Canadian Agent for Pasco Wheels**

BUFFALO, Oct. 28.—The Northern Electric Co. has been appointed Canadian agent for Pasco wire wheels and will handle them in all its Canadian branches.

**Auction Smith Truck Assets**

CHICAGO, Oct. 29.—The assets belonging to the estate of the Smith Motor Truck Corp., which was declared bankrupt in August, will be sold at auction by Samuel L. Winternitz & Co. at Clearing, Ill., Nov. 15. The inventory value is placed at \$1,500,000 and the assets to be sold include \$150,000 of standard hardware and 2000 tons of cast iron, malleable gray iron, steel machine cast forgings and castings, 200 tons of 1 15/16-in. shafting, 50,000 13 to 24-in. steel sprocket blanks, etc. Included in the specialties for Fords listed in the sale are 10,000 vanadium steel axles in the rough. A large stock of tractor parts will be auctioned off also together with fixtures, etc.

**Moller & Schuman Becomes Hilo**

BROOKLYN, N. Y., Oct. 28.—The Moller & Schuman Co., paint and varnish maker, has altered its corporate style to Hilo Varnish Corp. The personnel of the company remains unchanged.

**Milwaukee Ford Branch Locates**

MILWAUKEE, Oct. 26.—The Milwaukee branch of the Ford Motor Co. has leased a building with 40,000 sq. ft. of floorspace from the Val. Blatz Brewing Co. for a period ending one year after the close of the war, for the accommodation of its parts, service, warehouse and office departments during the time the Government occupies the Milwaukee assembling plant as a hospital. The Ford company will vacate its building by Nov. 1. The temporary headquarters building is located at Market and Johnson Streets, in the downtown district of Milwaukee. It formerly was used as a cooper shop by the Blatz brewery. The annual rental is \$10,000.

**Grand Rapids Brass Enlarging**

GRAND RAPIDS, Oct. 26.—The Grand Rapids Brass Co. will increase its capitalization by \$75,000. The company has at the present time six Government contracts, totaling several hundred thousand dollars, which will take about 70 per cent of the manufacturing capacity of the company. Other orders are expected to be received, and it is believed that for the fiscal year 1918 the company's total business will amount to about \$1,000,000. The company owns plants in Grand Rapids and Lansing and employs about 400 men.

**May Not Take Boston Buildings**

BOSTON, Oct. 26.—There is a hitch in the plans to take over all the motor buildings on Commonwealth Avenue and now it begins to look as if the dealers will not have to go scurrying about for places. Rear Admiral Wood, who has charge of the First Naval District, approved of the plan, and he was anxious to house the sailors there for the next eight months. But when officials of the Navy Department went over the figures submitted by the Boston dealers the cost seemed too high.

**Kirkpatrick in Motor Transport**

NEW YORK, Oct. 28—Andrew Kirkpatrick, vice-president and secretary of L. V. Flechter & Co., has resigned to enter the Motor Transport Corps.

R. C. Greth has been appointed district representative of the Cleveland Tractor Co. in the Oklahoma territory. For the past 2 years he has been engaged in the automobile business in Phoenix, Ariz., prior to which he was associated with the Overland and Hudson companies as special representative.

U. B. McCurdy has been appointed district manager for the Cleveland Tractor Co., with headquarters at 1307 Waldheim Building, Kansas City. The territory which will be under the supervision of the Kansas City office comprises Kansas, Nebraska, Colorado and Wyoming, also portions of Missouri, Iowa and South Dakota.

M. M. Risberg has been appointed controller of the Republic Motor Truck Co., Alma, Mich., and the other concerns controlled by the Republic company—the Republic Motor Truck of California, the M. & S. Corp., Detroit, and the Torbenesen Axle Co., Cleveland. W. G. Ralph will be Mr. Risberg's assistant.

Arthur Birge, who was manager of the Ames Tool & Shovel Co., Anderson, Ind., has succeeded R. F. Dyer as assistant sales manager of the Aluminum Castings Co., Detroit.

Howard Emery, who was manager of the Detroit plant of the Aluminum Castings Co. a few years ago, and later transferred to the managership of the Manitowoc plant, has returned to the Detroit plant to occupy the position of manager recently vacated by Charles B. Bohn.

A. H. Doolittle, formerly sales and advertising manager of the Zenith Carbureter Co., Detroit, has joined the publication division, service department, Bureau of Aircraft, in Detroit.

Major H. O. Bernhardt, formerly production manager of the Pierce-Arrow Motor Car Co., and more recently factory manager of the Harroun Motors Corp., Wayne, Mich., has been promoted to the rank of lieutenant-colonel. He has recently completed an assignment at the plant of the Bethlehem Steel Co., Bethlehem, Pa., for the chief of ordnance, and comes to Detroit representing him as assistant district chief, assigned to the Ford plants at Highland Park and Dearborn.

Elmer H. Hohenthal, formerly associated with the Bosch Magneto Co. and the Simms Magneto Co., has been appointed manager of the Detroit sales and service branch of the Eisemann Magneto Co.

## Men of the Industry

### *Changes in Personnel and Position*

Charles M. Smith, formerly associated with the Detroit Steel Castings Co. and with the Michigan Steel Castings Co., Detroit, has been appointed superintendent of the foundry operation by the Nelson Bronze Co., Saginaw, Mich.

E. M. Benedict has been appointed general manager of the Jackson Munitions Corp., Jackson, Mich. He comes from Toledo, Ohio.

Archibald Black, recently aeronautical engineer of the L-W-F Engineering Co., College Point, N. Y., has become aeronautical engineer with the Bureau of Construction and Repair, Navy Department, Washington, D. C., and began his duties there Oct. 21, 1918.

**75,288,851 Tons Iron Mined in 1917**

WASHINGTON, Oct. 28—Iron ore mined in the United States in 1917 totaled 75,288,851 tons, exceeding the 1916 output by 121,179 tons, according to a report issued here to-day by the Department of the Interior. The ore was mined in 25 States in 1917 and 24 in 1916, the greater part of the output coming from Minnesota, Michigan, Alabama, New York and Wisconsin. The imports of iron ore in 1917 were 971,663 tons as compared with 1,325,736 tons in 1916.

A total of 38,612,546 tons of pig iron, exclusive of ferroalloys, was shipped or used by producers in 1917, as compared with 39,126,324 tons in 1916, a decrease of 1.32 per cent. The production of pig iron, including ferroalloys, in 1917 was 38,647,397 tons in 1917, as compared with 39,434,797 tons in 1916, a decrease of 4.5 per cent.

**1000 Liberty Engines Produced Weekly**

WASHINGTON, Oct. 30—Production of Liberty airplane engines for October has reached an average of 1000 per week. This was the production hoped for by December. There are now 2500 fighting planes, not including single seaters, manufactured in this country and shipped abroad to the American Expeditionary Forces. These include 150 heavy bombers and other planes of all classes, such as observation and day bombing machines. It was stated here to-day that the production of aircraft has reached a point where it is limited only by facilities for transportation to France and that there are more American-made airplanes awaiting shipment at points of embarkation than can immediately be loaded.

**Veteran Boston Dealer Dies**

BOSTON, Oct. 26—Frederick S. Smith, one of the pioneer dealers in Boston, and who has handled the Mercer car, was buried here yesterday. He was another victim of the Spanish influenza pneumonia epidemic.

Charles T. Jeffery, Kenosha, Wis., who was president, general manager and one of the chief owners of the Thomas B. Jeffery Co., until the interest was acquired by the Nash Motors Co., has accepted a position as one of four superintendents of industrial relations for the Emergency Fleet Corporation. He will have charge of the Delaware River district, with headquarters in Philadelphia.

W. L. Romaine, secretary of the Badger-Packard Machinery Co., Milwaukee, has accepted the appointment of director of the division of oil conservation of the Fuel Administration for Wisconsin. This is a new position which has been created for the purpose of administration of rules and regulations affecting the use of fuel, lubricating and other oils, as well as gasoline and other petroleum products.

B. T. McDonald, manager of the Poughkeepsie (N. Y.) works of the Moline Plow Co., Moline, Ill., has temporarily been transferred to Stoughton, Wis., to take charge of the Mandt vehicle branch of the Moline company during the illness of George Ford. Mr. McDonald was general manager of the Stoughton plant before being placed in charge of the Poughkeepsie works.

**Manganese in Utah**

WASHINGTON, Oct. 28—Manganese ore reserves have been found in the Green River district of Utah, according to the Department of Interior, which has just completed an examination of this region. The investigations included a thorough examination of 20 manganese mines and a detailed survey of 4 square miles. The mines in this district are producing from 400 to 600 tons of manganese ore monthly and, according to the reports, there are at least 7300 tons of high grade ore still available for mining under present conditions and without modification of existing methods. In addition 22,500 tons, chiefly in the residual surface deposits, will be available under improved conditions or methods. Most of the ore in this district contains close to 4 per cent of manganese and is consequently a profitable mining venture.

**Motor Transport Corps Insignia**

WASHINGTON, Oct. 28—The Motor Transport Corps will use a purple hat cord to designate its enlisted men. The hat cords will soon make their appearance, although they are not likely to become common in this country, as the Motor Transport Corps is essentially an overseas organization and the men and officers both go to France shortly after completing their training courses.

### Ordnance Department Contracts

WASHINGTON, Oct. 28—The following contracts were placed by the Ordnance Department:

Holt Mfg. Co., Peoria, caterpillar tractors.  
Briscoe Motor Corp., Jackson, machining shells.  
Four Wheel Drive Auto Co., Clintonville, chassis.  
Nash Motors Co., Peoria, chassis.  
Cadillac Motor Car Co., Detroit, motor spare parts.  
The Sterling Motor Car Co., Washington, shells.  
Nash Motors Co., Kenosha, miscellaneous truck equipment.

### Quartermaster Corps Contracts

WASHINGTON, Oct. 28—The following contracts were placed by the Quartermaster Department:

Splitdorf Electric Co., electrical supplies, \$6,155.68.  
B. F. Goodrich Rubber Co., tubes, \$3,050.  
Fisk Rubber Co., casings, \$6,888.  
Pantasote Co., New York, side curtain material, \$22,800.  
B. F. Goodrich Co., casings and tubes, \$7,056.  
H. W. Johns-Manville Co., motor parts, \$8,325.01.  
Willard Storage Battery Co., storage batteries, \$8,778.60.  
Goodyear Tire & Rubber Co., casings and tubes, \$7,090.30.

### More Quartermaster Contracts

WASHINGTON, Oct. 21—Following is a list of contracts placed by the Quartermaster Depot of the Army:

Kelly-Springfield Motor Truck Co., motor parts, \$32,540.45.

Packard Motor Car Co., Detroit, motor parts, \$36,987.21.

### Aircraft Production Contracts

WASHINGTON, Oct. 25—The following contracts have been recently placed by the Bureau of Aircraft Production:

Wright-Martin Aircraft Corp., New Brunswick, engine spares.  
Hartzell Walnut Propeller Co., Piqua, generator propellers.  
Howell & Lesser, San Francisco, airplanes.  
Curtiss Aeroplane & Motor Corp., Buffalo, spares for planes.  
Splitdorf Electrical Co., Newark, engine spares.  
Splitdorf Electrical Co., Newark, magnetos and parts.  
Firestone Tire & Rubber Co., Akron, balloon.  
Splitdorf Electrical Co., Newark, engine spares.  
Zenith Carburetor Co., Detroit, carburetors.  
The Willys-Overland Co., Toledo, engine spares.  
Wilson Foundry & Machine Co., Pontiac, engine spares.  
Pittsburgh Model Engine Co., Pittsburgh, engine spares.  
Wright-Martin Aircraft Corp., New Brunswick, tools.  
Curtiss Aeroplane & Motor Corp., Buffalo, cylinders.  
Stromberg Motor Devices Co., Chicago, engine spares.  
Champion Ignition Co., Flint, spark plugs.  
Silvex Co., South Bethlehem, spark plugs.  
Gray & Davis, Boston, aero navigation lights.  
B. V. D. Electric Co., San Antonio, magneto trouble finders.  
Oxweld Acetylene Co., Thirty-sixth and Jasper Place, Chicago, blowpipe and extras for welding outfit.  
Buffalo Aeroplane Corp., Buffalo, services and material.  
Harrison Radiator Co., Lockport, radiators.  
Boech Magneto Co., New York, starting magnetos.  
Wright-Martin Aircraft Corp., New Brunswick, N. J., tools for engines.  
Grand Rapids Airplane Co., Grand Rapids, Mich., tools, jigs, dies, etc.

## Contracts

The Connecticut Aircraft Co., New Haven, supply bags.  
W. H. Mullins Co., Salem, Ohio, spares for planes.

### Revise Export Commodity List

WASHINGTON, Oct. 29—A revised export commodity list for European Holland, issued by the War Trade Board, states that the following articles are among those which will be considered for exportation: Automobiles (passenger), bicycles, motorcycles and spare parts but no tires and no accessories. Prospective importers should obtain import certificates from the Netherlands Overseas Trust and should upon receipt of the certificate notify the prospective exporter and advise him of the serial number. The exporter in turn will then apply to the War Trade Board for his export license.

### Highways Congress for Chicago Dec. 4-5

NEW YORK, Oct. 30—The Highways Industries Association and the American Society of State Highway Officials will hold a highway congress at the Congress Hotel, Chicago, Dec. 4 and 5. The congress will be opened on Wednesday morning, Dec. 4, and will be addressed by Logan Waller Page and Fourth Assistant Postmaster James I. Blakeslee. Speakers at the afternoon session are Governor Cox of Ohio, E. J. Mehren, Editor of *Engineering News-Record*, and Roy D. Chapin, chairman of the Highways Transport Committee. S. T. Henry, third vice-president of the Highways Industries Association, will address the evening session. The speakers for Thursday session are A. R. Hirst, Paul D. Sargent, J. W. Bliss, H. Eltinge Breed, A. G. Batchelder, A. B. Fletcher, Duncan Buie, Geo. P. Coleman, George M. Graham and H. J. Shirley. It is planned that the congress shall go into every phase of highway construction, maintenance and use.

### First "Eagle" Placed in Commission

Washington, Oct. 30—The first of the "Eagle" boats built for the Navy at the Ford Motor Co. plant, Detroit, was placed in commission yesterday, according to an announcement by Franklin B. Roosevelt, Acting Secretary of the Navy.

## Calendar

### ENGINEERING

Nov. 14-15—New York. Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

### SHOWS

Oct. 30-Nov. 4—Shreveport, La. Tractor demonstration. State Fair.  
Nov. 11-16—Phoenix, Ariz. Tractor demonstration. State Fair.  
Nov. 11-16—Pittsburgh, Pa. Fall Automobile Show. Motor Square Garden. Automobile Association of Pittsburgh.  
Jan. 13-19—Des Moines, Ia. First Tractor Show. Des Moines Thresher & Tractor Club. H. J. Clark, Mgr.

### Dissension in the Aero Club

NEW YORK, Oct. 30—That there is organized opposition to the regular ticket proposed for the election of officers of the Aero Club of America on Nov. 11 was made evident to-day when Roy U. Conger, leading the opposition forces, applied to the Supreme Court for an order to compel the officers of the club to supply a list of all members and their addresses or, alternatively, to permit them to be copied.

The officers proposed by the opposition are Howard E. Coffin for president and Cortlandt Field Bishop, Howard Talbot, C. M. Vought and L. L. Briggs as vice-presidents. There is no fight on the proposed governors.

### Charles G. Roebling Dead

TRENTON, N. J., Oct. 28—Charles G. Roebling, vice-president of the Mercer Automobile Co., died Saturday, Oct. 25.

### Bishop White Passes Away

BRIDGEPORT, Oct. 28—Bishop White, vice-president and general manager of the American Chain Co., and treasurer of Pratt & Cady Co., Hartford, died of pneumonia on Sunday morning at his home, West Hartford. He was 33 years of age. Bishop White was born in West Hartford in 1885. Immediately after finishing college Mr. White became identified with a New York bank, and shortly thereafter started business as a manufacturers' representative in the automobile supply trade, which brought him in contact with the Weed Chain Tire Grip Co., with whom he became associated about 1911. When the American Chain Co. was incorporated in 1912 Mr. White went to Sherrill, N. Y., to organize and manage that company, which later absorbed the Weed Chain Tire Grip Co. after the business had been transferred to Bridgeport. He then became vice-president and general manager of the new corporation, a position which he held at the time of his death. In 1914 Mr. White successfully carried out the reorganization of the Pratt & Cady Co., of which concern he was treasurer. His widow and one child, Bishop White, Jr., survive him.

### Twin Disk Clutch and Clutch Pulley

(Continued from page 760)

this case the central disk is the driven one, and the two outer disks are the drivers. The latter are turned with grooves in their circumference, these grooves taking felt packings designed to exclude dust from the friction surfaces.

At the present time the large clutch is made in one size only, with friction disks 11½ in. in diameter, and this is said to be suitable for tractor engines delivering all the way from 30 to 60 hp. The clutch pulley also is built in only one size so far, but other sizes are in contemplation.

Thomas L. Fawick, designer of the clutch and clutch pulley, has had 8 years' experience in tractor work.

# Stewart V-RAY SEARCHLIGHT

*A Real Searchlight—Not a "Spotlight"*

When you have occasion to use a searchlight, you want a *real* searchlight—not a "spotlight" with its small restricted "spot" of light.

You want a strong, powerful, all-revealing searchlight beam.

That is what you have in the Stewart V-Ray Searchlight. Its penetrating shaft of light shoots 'way down the road, revealing even the most distant objects.

The exterior design is particularly noteworthy. See how it stands apart—a thing of beauty. Observe how symmetrical it is. Note the design of the body; also the back.

It is beautifully finished with many coats of jet black enamel, baked on. And there is just a touch of nickel here and there to make the "tailor-made" appearance complete.

The Stewart V-Ray Searchlight harmonizes with the design of the modern automobile. Adds to its appearance. Looks like a built-in part of the car—not like a misplaced, re-vamped headlight.

It is scientifically designed. Made with a perfect parabolic reflector, which is silver-plated—not polished tin. Has a full six inch curved lens, instead of plain window glass.

A 3/4 inch reducing mirror, included at no extra cost, is located in the center of the back. It is not necessary to twist the light at an unsightly angle to use mirror. The switch is located conveniently so the hand finds it instantly in the dark.

The back is so formed that the hand grasps the light naturally, without cramping—and turns the light in any direction—up, down, right, left, front, or back—with ease. The case is absolutely dust and moisture-proof. A focusing device permits the use of any size bulb.

The bracket—an exclusive Stewart feature—not only permits turning the light in any direction, but also fits any windshield.

Both its handsome appearance and complete utility recommends it. It has high quality and finish all the way through. Its low price—\$5.00—is not an indication of quality, but a tribute to the Stewart Organization, which makes quality accessories at popular prices possible through large quantity production.

And so it is with all Stewart Automobile Accessories. Each, because of sheer merit and high quality, deserves a place in the equipment of every automobile.

Stewart Accessories are sold by leading accessory dealers, jobbers and garages everywhere.

No. 19

## Liberty Engine Profits Not Excessive

In Contrast to Original "Bogey," Subsequently Reduced, and Costs of Similar Types to Our Allies, They Are Reasonable—Bare Statements of Hughes Report Create Misunderstandings—Charges Against Deeds and Vincent Considered Minor Compared With Allegations Investigated

**W**ASHINGTON, Nov. 5—That the former aircraft authorities and the automobile makers manufacturing airplane engines have been completely vindicated, and that this exoneration forms the important result of the Hughes airplane report is the opinion here following a week's digest of the statement.

As regards the less important findings, there are many varied views. Failure to recall the serious charges of wholesale graft and waste which instigated the Hughes investigation has led many to regard the disclosures in the report critically and to demand prompt action by the authorities.

They do not contrast the minor violations uncovered with the extravagant accusations which were shown to be untrue. Others are of the opinion that Mr. Hughes "went gunning for an elephant and came home with a squirrel."

This opinion is based upon the fact that Mr. Hughes started out to investigate charges of widespread dishonesty and possible theft of hundreds of millions, and only discovered less important wrongs which form the substance of his statement. However, the report which is an accurate statement and the result of a highly trained legal mind limited by the boundaries of law, would not have been complete had it not dwelt as thoroughly on the less important details also. Both those who believe that the report discloses most serious evils and those who

criticise it because it apparently dwells upon less important wrongs, fail perhaps to consider that the very absence of sensation, without intent magnifies the minor violations.

Perhaps the chief criticism of the report may be directed to its lack of explanations and comparisons without which some of the bare statements tend to create misunderstanding of the situation. This is particularly true in the case of the Liberty engine contracts.

In discussion of the profits made by the Liberty engine manufacturers Mr. Hughes told that the original bogey price was \$6087 and this was reduced in December, 1917, to \$5000 with the fixed profit at 12½ per cent. or \$625 per engine. This contract has again been changed recently and put upon a fixed-price basis of \$4000 per engine.

The engines are being manufactured by a number of companies, including Packard, Lincoln and Ford, says the report, at costs of from \$3200 to \$3583 with the result that under the \$5000 bogey, manufacturers made profits up to \$1100 per engine while on the \$4000 fixed-price, profits will range up to possibly \$1000 per engine on the total contract outputs.

This profit Mr. Hughes calls "very liberal." The tenor of his statement is that an excessive profit has probably been made heretofore, and it is here that his bare statement of facts without explanation

and comparison is likely to lead the public to the impression that automobile makers producing Liberty engines are guilty of profiteering.

That this is not the case is easily understood when, first, consideration is given to the fact, that the European nations are paying \$11,000 per engine for types similar to the Liberty though not as powerful, and secondly that the original bogey price set on Liberty engines, in view of European costs, was exceedingly low and perhaps more of a "gamble" for the manufacturers than for the Government.

The proof that the makers were not profiteering and were as anxious to reduce the figures as is the Government has been shown in their constant efforts to lower the production cost and their prompt collaboration with the authorities in the revision of contracts as warranted.

### First Cost Was Unknown

With the first work on engine production the cost, due to the fact that the industry was new and that the work was entirely experimental, was a completely unknown quantity. The automobile industry invested \$35,000,000. The first engines turned out at \$5000 netted some manufacturers but 5 per cent. on their investments. As production went ahead, however, the cost decreased. The personnel became more skilled. Production routing improved. And consequently the figures on the Liberty engine cost could be and were revised.

Therefore, although the profits made on the first engines, and the profits which would have been made on the \$5000 bogey contract on which possibilities Mr. Hughes dwelt at length, may have appeared excessive, in consideration of the risks undertaken by the manufacturers and the cost of European engines, they were reasonable.

### 60% of Profits to Government

Further, as stated by Attorney General Gregory in his comment on the contractors' profits, while "they appear to be unusually liberal, when it is remembered that 60 per cent. or more of them must be paid to the Government as income and excess profits taxes, and that most of the net profits will be invested in buildings and facilities which may or may not be capable of profitable use for an indefinite period after the termination of the contract, no such profits have been allowed as to justify a charge of bad faith."

The charges against Col. E. A. Deeds and Lt. Col. J. G. Vincent have aroused some resentment in the minds of those who believed that the violations and improper conduct of these men were minor in comparison to the charges Mr. Hughes sifted.

### Recommendations Considered Severe

It is pointed out that the report itself found no evidence of fraud or intent to defraud in the case of Vincent and in consequence it is thought that the recommendation for criminal prosecution against him is severe, particularly in consideration of the valuable services he has given the Government.

The charges against Col. Vincent are insignificant and purely technical. At the outbreak of the war

the Government had no factories of its own for speedy production of Liberty engines and the Packard company, equipped for immediate output, had pushed production regardless of the technicality of the law prohibiting any person interested in a corporation dealing with the Government from acting as an agent of the Government in business transactions with that concern.

Shortly after the Liberty engine was adopted as the standard aircraft engine, Col. Vincent resigned as vice-president of the Packard Motor Car Co., to accept the position of chief engineer in the production of the engine. The Liberty engine having been created there was no Government organization to expedite production. Nevertheless a complete engine was built within a month from the time the Packard company received instructions from the Government to proceed. This work was executed by an organization prepared and trained by Col. Vincent, that is the Packard experimental department which it is probable was the best equipped plant for this work in the whole United States. The accomplishment of results was put ahead of the technical correctness of the method. The sole charge is a technical one.

### Ford Defends Alien Enemies

Henry Ford who was criticised for his failure to remove employees who were German born and who were at work upon Liberty engines replied to the charges in a statement saying:

"The Ford Motor Co. has manufactured 1242 Liberty engines during the past month. That was about 300 more than were manufactured by the next highest factory. I do not know what better answer could be made to all the criticisms. We started later than others and have passed all, the production standing up to the most rigid inspection in every particular.

"Our policy is to make men, not to break men. In times of panic great injury and injustice are often done to innocent persons and we try to keep our heads. We would not allow injustice to be done to an old, trusted and valued employee even though he was born in Germany. The results speak for themselves.

### Claims German Was Efficient

"Mr. Embie referred to as the special example in the report has been with us over 12 years and he is a most able and excellent engineer and has always given perfect satisfaction. Not one word of fault could be found by Mr. Hughes or any one else with regard to Mr. Embie's actual work. We in the plant know he gave valuable systems and many suggestions for the development of the Liberty engine cylinders which are being furnished to all manufacturers at a saving of \$345,000 a month to the Government over former prices."

The criticism against Brig. Gen. George O. Squier that the construction of an adequate organization for aircraft production was beyond his competency, is taken here by many as a direct reflection upon the War Department. It is understood to imply that the War Department did not grasp the magnitude of

the task and that in leaving the huge aircraft programs in the hands of the Signal Corps it failed to realize the special features of this program and technique and skill involved.

Some comment is made that the report does not dwell sufficiently upon Howard E. Coffin but considering that Mr. Hughes failed to find Mr. Coffin guilty of wrong acts and that his position was purely advisory, which findings exonerate Mr. Coffin from all the charges made against him last spring, little more could be expected.

The difficulties under which Mr. Coffin worked and by which he was hampered are clearly reflected in that part of the report which dwells upon the inefficiency of Gen. Squier's office. Recommendations by the Aircraft Production Board, which was headed by Coffin, went for naught. Attempts to have production on the Caproni and other planes started were thwarted time and again. Most of the other recommendations were likewise tabled or delayed.

### Great Credit Due Old Board

Perhaps the best proof of the worth of the original aircraft board was shown recently in a statement by the present authorities to the effect that great credit was due that board and that the present aircraft successes are solely the result of the continuation of the principles and program laid down originally.

The charges that unfair contracts for the Government were entered into are shown by both Mr. Hughes and Attorney General Gregory to be incorrect. No contracts providing for a fixed percentage of profit on production cost were made.

It will be recalled that the earlier charges maintained that contracts had been made by which manufacturers were to receive a certain percentage of the cost for their profits.

Under such contracts, it was said, the higher the cost, the greater the profit, and, consequently, it would be to the interest of the manufacturer to increase the cost rather than lower it. As Attorney General Gregory stated "no such contracts have been made."

The forms of contracts entered into have all been on the cost-plus basis, the only forms of contracts which would be sufficiently flexible to operate satisfactorily and which could be made in view of the unforeseen and uncontrollable changes in the prices of material and labor.

The contracts that were made under the cost-plus arrangement are shown by the Attorney-General to insure a gradual decrease of cost to the Government by the provision that the contractor would share in the saving if the actual cost were less than the estimated cost or bogey, in the contract. Furthermore the contracts that were made contained a clause reserving to the Government the right to terminate them or revise them at any time by repaying the amounts expended plus the fixed profits on finished articles and 10 per cent of the labor and materials costs on unfinished work.

Thus, the sensational charges of last spring, made by a man who used a personal letter from the President, as the credential for investigations taken up by members of Congress, in some instances possibly for political reasons, and later developed to such a degree that they were serious reflections upon the automobile industry, have come to naught.

## Carbo Steel Deck for Loading Automobiles

THE Carbo Steel Post Co., Chicago Heights, Ill., has devised a deck for loading freight cars with automobiles, motor trucks and tractors which permits of in-

creasing the capacity of a box car from 60 to 70 per cent over single-deck loading. One car is placed on the floor, and the steel deck is placed over it, another car being placed on the deck, reversed end for end with respect to the first one. The method of loading by means of these decks can be used on flat cars as well as in box cars, and will then increase the capacity 100 per cent. These steel decks are said to be lighter than wood decking, and thus to save freight.

In loading cars with the aid of the Carbo deck the wheels need not be taken off the top cars, and generally the tires are even left on. As the cars straddle each other, the height of the two cars combined will be 18 to 24 in. lower than with other methods of loading. It will be seen from the illustration that the two cars are reversed end for end.

These decks are also used by automobile dealers and warehouses for storage purposes, and they are claimed to be preferable to pits for repair work. The decks are standardized for various loads and purposes, and they are either leased or sold outright.

# Agreement vs. Bargaining

Trust or Confidence Between Employer and Employee Impossible So Long As Both Frankly Base Their Relations Upon Their Ability To Take Advantage of a Bargain

By Harry Tipper

**A**LMOST all the strikes which have taken place in the various countries at war have been distinguished by the decision of a body of workers to strike in the face of instructions to the contrary from their national union, and the fact that they have frequently broken a contract made by the same body at an earlier time.

Not long ago there was a strike of press feeders in Chicago. This strike was repudiated by the National Union. The employing printers had an organization and agreed to allow the men to strike rather than meet the demands.

The men struck, and after a few days some of the employing printers deserted their organization, with whom they had agreed to stand out against the men, and met the demands in order to go ahead with their business.

As this is being written there is a strike of press feeders in New York, despite the fact that it is not countenanced by the National body, and despite the fact that there is an agreement with the employers which should run till next spring.

Whenever a group of manufacturers gets together and talks about the labor question there are two matters which always come in for a good deal of attention—the uncertain character of an agreement with a union and the weakness of some members of the manufacturers' group.

The fact is local interests and necessities are paramount with both sides. Just so long as there is no reason for breaking away from an agreement the general action of the group stands, but so soon as the local situation presents either advantage or apparent necessity for special action that local condition will govern, general agreements to the contrary notwithstanding.

The present conflict has witnessed more of this independent action of local labor unions and manufacturers' groups, because the local conditions of the labor market in a time of such scarcity give the worker much advantage in a bargain, and the local conditions of business with so large a governmental necessity influence the attitude of the

local manufacturers' body upon the same matters.

Since wages ceased to be the subject of legislation and became the private concern of the parties at interest, the amount of such wages has been a matter of trade. When the labor market was overstocked with available labor, the manufacturer has always used that to keep down the price and when the market has been unable to supply the demand the worker has always seized upon his advantage to increase the price of his work.

Both sides have had a good deal to say about their rights and how just and fair they were in their attitude toward the matter, but the history of the continual disputes and the condition of wages shows

clearly that wages have always been based upon the horse-trading principle—each side gets as much as it can from the other, according to the prevailing conditions.

Under such a system of payment there is no relation between the value of a piece of work and the amount which may be paid for it. Because they are in a better position to drive a bargain, the strongly organized branches are constantly improving their working conditions, while those who are less well organized are constantly losing ground.

Thus workers in some of the metal and mining trades have been able to strengthen their position so thoroughly that during this war they have reached \$5,000, \$10,000 and even a larger scale of yearly earning capacity, while the supervisors who must govern these workers have not increased appreciably.

I know many men who must govern large business affairs and accept important responsibility whose earnings are less in commodity value than they were before the war broke out, while their employees are able to indulge in luxury to an unheard-of amount.

Workers whose job requires so little judgment or skill that they can become expert in six weeks are making \$50, \$60 and \$100 per week, while a vast army of clerks, accountants and minor executives in business who have spent many years in a

**“W**HERE the majority vote is necessary to ratify an agreement, the majority vote can, of course, rescind such an agreement and, while between individuals a contract must involve a *quid pro quo*, it has been found impossible as yet to enforce the same principle in contracts between organized masses, so that these contracts are practically nothing more than expressions of opinion between the majorities which it is hoped will last the length of the agreed time.”—*The New Business*.

slow growth in the required training of their specialization are not nearly so well off from an earning standpoint as they were before the war.

In the days of hand labor the craftsman was paid according to the length of apprenticeship required for his training and for his extra skill at his work when the training was over.

The present methods of deciding wages and of readjusting them cannot be justified upon any consideration of equity and can be of value only if industry is to continue to run its business upon the basis of horse-trading, with its concomitant discontent, compromise and readjustment.

There are some manufacturers who have stated to the writer that they expected to continue their business upon those lines and to be able to secure a dominant position again after the war is over. One of them stated the case in these words:

*"We are accepting these conditions now because we are in business to win the war and we will go out of business if necessary to do that; but you wait till the war is over and we get back on commercial business. There will be plenty of labor then and we will get back to our old basis."*

It is not necessary to discuss the absurdity of this viewpoint, but it is necessary to point out that the worker is much more powerful than he has ever been before; not merely because of scarcity of labor, but because of the growing solidarity of his organizations and class consciousness, because of his numerical power as a voter in the political government of the country and his influence upon governmental outlook and action.

### Politics Based Upon Industrial Demands

The political demands of the Labor Party of Great Britain are mostly industrial demands turned into the political arena. The action of government upon industrial matters in this country has been visibly influenced by the importance of labor as a voting power. These things make it certain that a continuance of the old system of bargaining in the spirit of a horse-trade *will have the result of placing the manufacturer in a poorer position to trade at each necessity for decision.*

It will make it impossible to depend upon agreements between unions and manufacturers' groups and it will hasten the entry of industrial questions into the arena of political action.

For these reasons it is necessary for the manufacturer to study the wage system with a care that he has not given it heretofore. It will be necessary for him to approach the matter with some idea of finding out if there is a just way of computing the value of different classes of work and if it is possible to come to agreements with his employees instead of continually bargaining with them. It is this system which is at the bottom of the want of confidence between the employer and the employee.

*There can be no trust or confidence between parties who are frankly basing their relations upon the ability to take advantage of a bargain and to put into the bargain every advantage which conditions may open up.*

No agreement will ever make the workers of a locality or a factory lose a bargain when the advantage of bargaining is on their side, and it is evident from the record of strikes during the past four years that the attitude of the national body of workers will not be permitted to prevent the workers of that locality or establishment from getting theirs if there seems to be a good opportunity to do it.

No agreement with other manufacturers will keep the individual manufacturer so thoroughly tied up that he will not kick over the traces when there is an opportunity to get the best of the bargain with his local labor by breaking it, or get the advantage of his competitor by the same method.

There is little or no chance for the co-operative spirit in a manufacturing establishment, no matter what bonus, profit-sharing, welfare and other advantages may be offered, so long as all the workers in that establishment know that the wages and salaries are arranged as a matter of trade, and they are therefore only to be rearranged when the employee has some bargaining advantage.

### Unjust Wage System Causes Distrust

It is the lack of justice in the method of operating the wage system which is responsible for the unbelief in the employer on the part of the employee. It is not that the wages are necessarily small, but the continual bargaining individually and collectively results in such rank injustices that there are always many employees who feel that they have not been treated fairly because they were not good at bargaining, and there are just sufficient evidences at all times that this or that body of workers has been able to put it over to induce the other unions to try.

The most intelligent, alert workers are frequently the poorest bargainers and the radicals among labor leaders number quite a few of these.

It has been well said in advertising that the firm that wants to advertise and stay in business must tell the truth about itself and give just service. It is sure that if the good will of the buyer of goods can be permanently maintained only by telling the truth and giving just service, the good-will of the employee is not to be more easily secured.

This is a problem so important in its difficulties and so necessary in its solution that it could well be the topic of discussion between employer and employee sitting around the council table of the industrial organization.

### Industrials and the Reconstruction Period

IN England, as in other countries, the thought of industrials at this time is turning toward the period of reconstruction, and serious efforts are evidently to be made by British automobile manufacturers to secure tariff protection when the sale of automobiles will again be permitted. *The Autocar* quotes the Prime Minister to the effect that "the key industries must be allowed to reconstruct themselves while they have still behind them the spirit of patriotism and sacrifice which has been aroused by the war and of the spirit of fraternity which makes rich and poor one great people."

## Types of Tractors Recently Exhibited in France

*Plowing with De Dion-Bouton cable-winding machine**Doisy machine with winding drum**Paris General Omnibus Co. tractor**Tractor exhibited by the French Schneider company, showing front and rear views*

# Tractor Development in France

Scarcity of Horses and Agricultural Labor Compels Use of Tractors—Various French, Italian and American Types Shown at Demonstration Conducted by National Tractor Association

By W. F. Bradley

**P**ROOF of the importance which is attached in France to the farm tractor is to be found in the formation of a syndicate of tractor manufacturers and dealers in the decision to hold public demonstrations twice a year, in the spring and fall.

The first of the syndicate's demonstrations took place recently in the neighborhood of Paris, under the direct patronage of all the Government departments, and proved to be the biggest and most important event of its kind held in France. The situation at the present time is full of difficulties. Owing to the fact that the agricultural classes have furnished the greatest proportion of fighting men—for the mechanical classes have mostly been mobilized in the factories—land is going out of cultivation and each succeeding year shows a lower output of wheat. This condition will not be completely remedied with the end of the war, for the losses among agricultural workers have been so heavy that there will be a shortage of labor on the land for years to come. This fact is fully recognized by the various authorities, who are doing everything possible to increase the number of tractors in use.

The education of farmers to the use of tractors is the

*Tourand-Latil tractor recently exhibited in France under Government auspices*

lesser of the two problems. Eight years of demonstrations in various parts of the country have convinced the farmers that the land can be worked better by tractors than by horses. If they did not make the change it was more by reason of inertia than because of lack of conviction. Now that 2,000,000 farmers are in the army and horses are reduced in number so much that they have to be loaned from farm to farm, the only problem is how to get delivery of tractors.

Importers and French manufacturers are on an equal footing. The former cannot get shipping space and the latter are limited in their output by reason of the shortage of material. One firm alone, with an output of 5 four-wheel drive heavy artillery tractors a day, states that it is 200 agricultural tractors behind on deliveries. Other factories are in the same position. Although they possess manufacturing facilities they are held back on agricultural tractors by reason of the more urgent call for war material.

Such importers as Case, International Harvester, Cleveland, and Gaston, Williams & Wigmore have plenty of tractors, but they are all on the docks at New York. The French Ministry of Agriculture has taken the matter in hand and has purchased from the Case company, and shipped to France, more than 500 tractors, which are being either sold or rented to groups of French farmers. This is doing much to relieve the shortage, but the quantity is insufficient.

At the French demonstrations 13 French machines and 6 of American

*De Dion-Bouton machine with winding drum*

*The Auror light tractor going through its paces at the recent French exhibition*

origin were presented and demonstrated. The big automobile firms are interesting themselves in tractors. Among these are the De Dion-Bouton Co., the oldest automobile firm in France; the Latil Tractor Co., which is the largest artillery tractor concern in France; the Schneider Co., which has built most of the Paris omnibuses and is the largest maker of artillery in France; the Paris General Omnibus Co., which has taken up an English design. It is reported that the Panhard-Levassor Co. is interesting itself in an agricultural tractor. In Italy the Fiat Company, which claims to be the biggest of its kind in Europe, has already produced and marketed an agricultural tractor.

### Three Groups of Tractors

The French tractors are divisible into three main groups, which in numerical order of importance are: cable towing machines; direct haulage tractors; self-contained tractors with rotary and other type plows.

De Dion-Bouton has settled in the cable towing class after having experimented with various kinds of machines during the last half dozen years. The machines it presented are a simple type of chassis with four cylinder motor under a hood and winding drum placed amidships. The chassis is not spring-suspended at the rear, and has only coil springs at the front. Two types were shown, one of these having side chain drive to the rear wheels, and the other the De Dion-Bouton system of internal gear. Naturally, with this system two tractors are required for one plow, a tractor being placed at each end of the field being plowed.

There is a modification of this system in the Doisy tractor, which has the motor forward under a hood, three-speed transmission, a jack-shaft with drive by side chains to the rear wheels, and from the jack-shaft another chain drive to a winding drum placed within the chassis and hav-

ing its shaft parallel with the rear axle. The jackshaft is fitted with dog clutches so that either pair of chains may receive the power; that is to say, the rear wheels or the winding drum may be driven independently off the same shaft. The distinctive feature of this tractor is its locking arrangement. The cable is not taken direct from the winding drum to the plow, but is carried round an idler pulley mounted on a shaft pivoted transversely under the center of the chassis. Attached under the shaft is a heavy steel plate fitted with a suitable system of spikes. The pull on the cable passing round the idler pulley draws the locking mechanism into the ground, and the greater the pull on the cable the greater the locking effort obtained. Only one tractor is used, and when the plow has been drawn across the field it

must run across to the opposite end, paying out its cable as it goes, and, after dropping its locking mechanism, begins winding operations again.

The next of the cable machines is the Filtz, which is again different from the other two. The Filtz, which was one of the first to be put on the French market, and was really well known before the war, is a light tractor with a plow connected up to it by a chain, and which hauls itself across the field by a cable which is anchored solidly at each end and passed around two winding drums mounted on the extremity of shafts just outside the frame members. There are two seats with a central steering column and wheel between them. On reaching the headlands the driver moves from one seat to the other and reverses the drive.

In the direct haulage class the most successful and best known machine is undoubtedly the Tourand-Latil. This tractor was designed some eight or nine years ago by Tourand, who demonstrated it and experimented with it on limited means until the beginning of the war, when it was adopted by the Latil Tractor Co. This firm has become the biggest four-wheel drive artillery tractor concern in France, with a huge modern factory and a yearly output of more than 2,000. The agricultural machine has profited by this association, for although

*Operating Filtz agricultural tractor*

Three systems of cable plowing demonstrated at French trials: De Dion-Bouton system with two tractors operating winding drums; Filtz system with a plow attached to it and hauling itself along the field by means of a fixed cable; Doizy system using a single tractor which moved from one side of the field to the other and hauled the plow by means of its winding drum

Diagram showing Tourand-Latil system of raising plow

the same in principle it has undergone many improvements in detail and in manufacturing methods.

The motor is entirely new, being one of those used by the Latil company in the artillery tractors. The frame members have been redesigned so as to give a lower center of gravity and permit a better attachment of the plow to the tractor. This system of direct attachment of the plow to the tractor is one of the distinctive features of the Tourand-Latil. As will be seen from the illustrations, the plow is direct connected to the center of the frame, but pivoted at the rear, so that the entire plow can be raised or lowered by power in the shortest time, and is also adjusted for depth.

The only rotary plow in the trials was one presented by the S. O. M. U. A., this company being an auxiliary of the Schneider company. The machine, which is not new to the French public, is in the same general class as the Ford, so far as the absence of frame members is concerned. Here, however, the similarity ceases.

### Novel Features in Armleder Truck

A NUMBER of novel features are found in the new truck models of the Armleder Co., Cincinnati, O. One of these consists in the arrangement of the radius rods. These extend between the spring saddles on the rear axle housing and drop brackets secured to the frame channels. These radius rods are fitted with ball and socket connections at both ends so that they are not subjected to stresses due to road inequalities. The rods are secured to the rear axle by means of the spring saddles, which are accurately machined to fit over the axle housing. The saddles are lipped and so clamped over the housing that the transmission of the driving thrust will not tend to displace the spring clips. All moving parts are bushed. The radius rods are parallel with the propeller shaft and of the same length. They are so placed in relation to the frame that when the truck is under load they are almost parallel to the ground.

The second new feature is the engine hood. Each side member of this hood is removable, the idea being to afford easy access to both sides of the engine. The upper part of the hood is hinged against the dash so that it can be raised from the front end and secured in the raised position to permit of such operations as valve grinding.

*The Sopwith "Pup," on which the design of the "Camel" is based*

## The Sopwith "Camel"

Description of a Late Model British Scout Plane, Translated from  
a German Aircraft Publication

**A** NEW machine put out by the Sopwith Aviation Co., Ltd. of Kingston-on-Thames, "the Camel," is a development of the same firm's Pup. It differs from the latter, however, in having a more powerful engine and in numerous details of construction.

As in the older type the wings and tail plane with elevator are of trapezoidal plan form, but the greatest span occurs at the trailing edge. The top plane center-section has a span of 2.17 m., while the strut attachments are only 1.48 m. apart. As the fuel pressure tank and gravity tank are placed rather far aft, the pilot's seat is placed immediately behind the engine or underneath the top plane center-section. In order to provide a better view, a rectangular opening is cut in the center section. The longitudinal edges of this opening are provided with three-ply plates projecting beyond the wing profile so as to reduce the amount of air flowing over the edges. To facilitate getting into and out of the machine the trailing edge of the center-section has been cut away. Upper and lower planes have an equal span of 8.57 m., and an equal chord of 1.37 m. The aspect ratio is therefore 6.25 against the aspect ratio of 5.15 of the older type.

The wing spars, which are made of spruce, are spindled out to an I-section, with the exception of the bottom rear spar, which is left solid. The gap between the planes is 1.31 m. at the tips and 1.52 m. near the body. (In the older single-seater the gaps were 1 m. and 0.86 m. respectively.) The upper plane is staggered forward 0.45 m. There is no sweepback. The dihedral angle of the top plane is 178 deg. and of the bottom plane 170 deg. The angle of incidence of the top plane is 2 deg. at the center-section, 3 deg. at the tip. The bottom plane has a uniform angle of incidence of 3 deg.

The inter-plane struts, which are of solid spruce of streamline section, are, as in all Sopwith machines, placed with their ends in steel sockets welded to the fittings on the wing spars, and are provided with no further attachment. The lift wires and landing wires, of which the

former are in duplicate, are in the form of streamline wires.

Non-balanced ailerons are fitted to the rear spars of both planes. The wing fabric, which is sewn on to the ribs, is cream colored underneath, and the top surface, as well as the body fabric, is painted a reddish brown. The body, which is of the usual girder type with four longerons, has a rounded top. The undercarriage is of the usual Sopwith type. A divided aluminum axle rests in a streamline covering of wood. The axle hinges are braced from the fuselage.

The tail plane, which is deeply cambered on both sides, is rigidly attached to the upper body longerons with an angle of incidence of 1.5 deg. The tail plane trimming gear hitherto fitted to all Sopwith machines has been abandoned, in spite of the fact that the fuel tanks are placed behind the pilot's seat. The fin and rudder are of the usual characteristic Sopwith form.

The 130-hp. Clerget engine, which is built by Gwynnes, Ltd., develops about 134 hp. at 1200 r.p.m. According to a

plate in the pilot's cockpit the revolutions of the engine are not to exceed 1250 r.p.m.

The fuel pressure tank has a capacity of 138 liters and the gravity tank holds 32 liters. This gives sufficient fuel for a flight of about 3½ hr. duration. An oil tank with a capacity of 30 liters is placed behind the engine. In some machines the tanks are of welded sheet aluminum, in others they are made of lead-coated, riveted sheet iron. The weight of the tanks is 12.5 kg. and 20 kg. respectively, giving a percentage weight of

$$\frac{12.5}{146} = 0.0832 \text{ and } \frac{20}{146} = 0.133 \text{ respectively.}$$

In the pilot's cockpit are the following instruments:

In the center on the instrument board: Manometer, with safety valve, clock, pressure gage, altimeter, compass, two switches, revolutions indicator, and pulsometer. On the right: The hand-pump (air). On the left: Control levers for pressure and gravity fuel tanks, fuel tap, throttle lever, fuel level indicator for pressure tank, Bowden cable for bomb release. A propeller air pump for the pressure tank is mounted on the starboard chassis strut. Two fixed Vickers guns are mounted on top of the fuselage. Their locks and feed block

*Dimensioned drawings of wing spar, stabilizer and elevator*

Elevation and plan of fuselage

levers are inside the body covering. Between them is a telescope sight. In a bomb rack under the body can be carried four bombs, the Bowden controls for which are placed to the left of the pilot. There is no bomb sight fitted to the body of the machine.

The weight of the machine empty was ascertained to be 430 kg. With tanks full the weight of the fuel is 150 kg. With pilot and armament the useful load would then amount to 290 kg. It is therefore to be assumed that the weight of about 50 kg. of bombs is only carried when the tanks are not full. Assuming a useful load of 290 kg. the total weight "all up" amounts to 720 kg. As the wing area is 19.76 m<sup>2</sup>, the loading is 36.5 kg. per sq. m., and the loading per hp. is 720; 134 = 5.37 lb.-hp. The corresponding loadings for the Sopwith "Pup" were 23.4 and 6.6 respectively. The "Camel" has therefore a higher wing loading, but a considerably smaller loading per horsepower.

**Detail weight**—Motor, 159.0 kg.; propeller, 18.0 kg.; tanks, 12.5 kg.; motor accessories, 12.5 kg.; body with aluminum covering, etc., 48.5 kg.; seat, etc., 9.0 kg.; undercarriage, 39.0 kg.; tail skid, 2.5 kg.; controls, 4.5 kg.; wings, 100.0 kg.; tail plane, fin, rudder and elevator, 13.0 kg.; fittings for armament, 11.5 kg.; total, 430 kg.

**Weight of wings**—5.5 kg.-sq. m.

**Loading**—Pilot, 80 kg.; armament, 60 kg.; 4 bombs, 50 kg.; instruments, 5 kg.; fuel, 150 kg.; total, 290 kg.

The above article is reproduced from *Flight* of London, which had the text translated from the German. All dimensions in the various line drawings are in millimeters.

## Bellem Wins French Kerosene Tests

Starts Cold Engine on Kerosene—Engine Running Well in 4 Seconds—Is a Pulverizing Device—Can Be Fitted to Gasoline Engines

By W. F. Bradley

PARIS, FRANCE, Sept. 15.—The Bellem kerosene pulverizer for use on automobile and other engines, enabling them to use kerosene, won first and second prizes in the kerosene engine competition conducted by the Automobile Club of France, and so has carried off the \$10,000 first prize and the \$2,000 second prize. The Bellem device demonstrated that the engine could be running in perfect condition, according to the engineers conducting the tests, in 4 seconds from the time of starting, this being the best record of the test. The time required to get the engine running properly varied from 4 seconds to 45 seconds on the winning engine fitted with the Bellem. The engine started on kerosene, and did not use gasoline at all, although the rules permitted starting with gasoline if necessary.

There was a second engine fitted with the Bellem attachment which used gasoline for starting in some of the tests, and which required sometimes as long as 3 minutes to get into perfect operation.

The six different devices which started in the competition were given four distinct bench tests, as follows:

- 1—A 3-hour test with full load at full speed.
- 2—A 2-hour test with full load at half speed.
- 3—A 3-hour test with half load at full speed.
- 4—A 2-hour test without load at full speed.

After the engines had taken these four tests they were

fitted into a chassis and given a road test of 634 miles in 4 days, at an average speed of not less than 19 m.p.h. Because of their performance on the bench test only the two engines fitted with the Bellem device were eligible for the road test.

The Bellem devices for using kerosene were fitted to two four-cylinder Unic engines with 4 by 5.9 in. cylinders.

During the bench tests it was permissible to make use of gasoline for starting, on condition that a special tank was not employed. No. 1 Bellem was started on kerosene every time. No. 2 Bellem used a small amount of gasoline for starting. The time necessary to get the engines running properly was noted by Lieutenant Lumet, the club laboratory engineer. The best time was that of one of the Bellems, which was running perfectly in 4 seconds. The slowest time of the Bellems was 90 seconds. The slowest time for any competitor was 25 minutes. All the bench tests were made with commercial kerosene of 809 gravity and flash point at 58 deg.

Although applicable to any four-cycle engine, the successful Bellem system entails some changes in construction. The Unic engines used in the competition had originally been standard L-head type, block casting, with carburetor on the valve side. The modification consisted in changing the time of the intake valve, fitting a kero-

sene pulverizer in each cylinder head and placing a kerosene measuring instrument or distributor on the pump and magneto shaft.

The intake valve was timed to open 45 deg. before lower dead center. During this portion of the stroke a partial vacuum is formed in the cylinder, for only a very small quantity of air is drawn in through the kerosene pulverizer mounted in the cylinder head. This initial quantity of air carries with it a quantity of kerosene which has been fed to the pulverizer by the measuring instrument driven off the magneto shaft. This method of injecting the kerosene into a partial vacuum causes very fine pulverization. About 45 deg. before lower dead center the intake valve opens, and closes again 45 deg. after lower dead center. As there is a considerable vacuum in the cylinder when the intake valve opens, the short period during which it remains open is sufficient to get a complete charge even at high revolutions per minute. The charge is compressed to 4 to 5 kilograms per square centimeter and is fired in the usual manner by a high-tension magneto.

### Conditions of the Contest

The competition was organized to encourage the use of kerosene for automobile engines, and particularly for truck engines. For this reason the horsepower was limited between 20 and 40, the weight per horsepower had not to exceed 33 lb.—this included flywheel, carbureter, ignition appliances, cooling apparatus, but no water—and the fuel consumption had not to exceed 350 grams per horsepower-hour. Only appliances constructed entirely in France were eligible.

There were six competitors originally, but these dwindled down to four, two of the motors being presented by the Bellem company, one by the Aldo company, and one by the Genault company. Among the two who had en-

tered but did not go through the tests was Ballot, the biggest motor specialist in France.

The competition was originally slated for the early portion of the year, but owing to the military situation was postponed until last month. Incidentally, it was held in Paris, during the great German offensive, within sound of the guns, and while the city was receiving an occasional shell from Big Bertha.

The tabulation on the bench tests gives the horsepower of the different engines, their r.p.m., as well as the consumption in kerosene per hour, which is given in grams. In the full-load test the two Bellem devices showed practically the same power, approximately 32 hp. at 1160 r.p.m. The fuel consumption of one was 334 grams per hour and of the other two 97. The consumption of the two other devices, namely, Aldo and Genault, was so much higher, and their horsepower approximately 50 per cent lower, that they could not be considered factors in the test.

In the 2-hour test with full load at half speed the Bellem devices showed approximately 50 per cent horsepower, and the fuel consumption was 10 per cent greater than when operating at full speed.

With the Bellem devices operating at half load and full speed the fuel consumption was higher than when running with full load at half speed.

When the Bellem devices were operating at full speed without load the fuel consumption was 1.56 gal. per hour.

In the road tests with the Unic engines, fitted with the Bellem devices placed in automobiles, good results were obtained. The total weight of No. 1 car was 3783 lb. in full running order, and its average kerosene consumption was 13.1 miles to the American gallon. The average speed maintained was 25.4 m.p.h. No parts of the engine had to be touched during the road test, and

*Left side view of Packard truck engine fitted with Bellem kerosene feeding device*

*M. Bellem, winner of the \$10,000 prize for kerosene-burning appliances, at the wheel of a Unic car converted to a kerosene-burning machine*

the only incidents recorded by the official military observer were a seize brake and a broken feed pipe. The latter was repaired with a piece of gasoline-proof rubber hose.

The second Bellem engine was placed in a new type Unic chassis with a two-seater test body and bags of sand as ballast. The total weight was 3977 lb. Average speed was 24.9 m.p.h., and average fuel consumption 13.2 miles to the American gallon. This car had no engine trouble on the road, the incidents noted being a loose steering connection, a fractured feed pipe and a lost oil plug.

The Bellem kerosene device is manufactured by Bellem & Bregeras, a French company, in which the Unic company is interested. Several gasoline-type engines have been converted by the Bellem system, including a number of Packard 3-ton trucks belonging to the French Army, and also a number of standard engines used in French submarine chasers.

The Bellem device consists of two parts—one, what might be designated a distributing mechanism by which the necessary quantity of kerosene is given to each cylinder for each explosion, and another a pulverizing system by which this quantity of kerosene is completely pulverized, making it possible to start a cold engine without the use of gasoline. No liquid kerosene enters the cylinder, but the pulverization is so complete that a very fine mist is formed within the cylinder. The pulverizing apparatus is fitted in the cylinder head in place of the priming cups, whereas the distributing mechanism is placed on the crankcase at the forward end of the engine.

The quantity of kerosene required for a single explosion in the cylinder will vary from a drop to practically nothing when the engine is running light, and at an engine speed of 1800 r.p.m. this quantity

of kerosene has to be delivered in the short time of one one-hundredth of a second.

The distributing mechanism consists of a cam-operated plunger pump with a cork packing. A variable column of mercury is used to control the pressure of fuel feed. The pump plunger is spring returned, and the amount of fuel fed per stroke can be controlled by means of a stop which is interlinked with the throttle valve.

The kerosene from the distributor goes to the pulverizers, which are placed in the cylinder heads in place of the priming cups. In some cases this pulverizer is an automatic valve, but on the Unic competition engines it was mechanically operated by means of an overhead camshaft. This comprises a hollow-stem poppet valve. On the beveled edge of the valve head, and within the valve seat, are a number of equally spaced holes. When the valve is forced from its seat, either mechanically or by suction, air is drawn through the hollow stem and through the fine holes in the valve head, and these horizontal streams of air impinge upon the vertical currents of air and fuel coming through the fine holes in the valve seat, thus thoroughly pulverizing the fuel.

IN view of the increased demand for tungsten ores, it is interesting to record a substantial increase in the exports from the Federated Malay States in 1917. The Federated Malay States Government has suspended the export duty on tungsten ores, and is granting free prospecting licences, and one result of this policy is the trebling of the output since the outbreak of war. The chief cause of the increase in the State of Perak was the discovery of two very rich non-extensive deposits of scheelite on a tin-mining property.

# Foote-Strite Tractor Transmissions

Made in Models Suited to Tractors with Longitudinally and Transversely Mounted Engines — Given Either Two or Three Forward Speeds — Belt Pulley Drive Is Incorporated with Transmission

**F**OOTE BROS. GEAR & MACHINE CO., Chicago, Ill., are producing a line of tractor transmissions from designs by George T. Strite, the well known tractor engineer. These transmissions are so designed that they are readily adaptable to almost any design of tractor, and a wide range of gear reductions can be obtained. One style of the transmission is designed for tractors on which the engine is arranged longitudinally and the other for tractors in which the engine sets crosswise. In the former the first reduction is by a pair of bevel gears. The shaft on which the driven member of the bevel gear set is mounted is of the splined type and also carries two sliding pinions and the belt pulley. The shaft is made of a length to bring the pulley the desired distance from the transmission housing and is surrounded by a tube to which a bearing housing can be fitted at the outer end. The inner end of the tube screws into the cast iron transmission case. The design of the outer end is left open, as it has to be varied according to frame design, general layout of power plant, etc.

The two sliding pinions are arranged to be slid into mesh with the two gear crowns of a double intermediate gear respectively, by means of a selective control mechanism mounted on top of the transmission housing. One of the gears of the intermediate set meshes with the gear on the differential, and a

variation in gear reduction can be made by using either the smaller or the larger gear of the intermediate set for the purposes. Other variations are made possible by changing the sizes of the sliding pinions and of the differential crown gear. In fact, the latter may be made with from 48 to 72 teeth. The differential, which is of the self-contained bevel pinion type, is mounted on the jackshaft, from which the drive is to the rear wheels by bull pinion and gear, the latter either of the spur or internally toothed type.

With a transversely mounted engine the bevel gear reduction is dispensed with and the splined shaft carrying the sliding pinions is direct connected to the clutch shaft. The transmission is then an all-spur design. In this case the forward part of the transmission is located alongside of the engine and the narrow width of the transmission case makes this possible. A flange is cast on the transmission housing which joins directly to the engine bell housing.

It was stated above that the housing was of cast iron, and while this is the material mostly used, the Foote company is also prepared to furnish housings of semi steel or cast steel. It will be noticed that the main part of the housing is in a single casting, which, together with the well-planned ribbing, makes for great rigidity. There is a large opening on top, covered by a hand hole plate, through which the differ-

Side elevation of and horizontal section through Foote-Strite transmission, with first reduction by bevel gears

## Foote-Strite Model DU Tractor Transmission.

*With this transmission is combined the rear axle which has a drive through planetary pinions. All shafts run on roller bearings and a spring drive to the wheels is provided for*

ential and other parts may be introduced. There are two tapering jackshaft housings which bolt to the sides of the transmission and carry the bearings for the differential and the jackshaft. The jackshafts are supported in Hyatt roller bearings near the bull pinions, while the differential is carried in parallel bearings. There are also Hyatt roller bearings on the splined shaft, and where the bevel gear set is used ball thrust bearings are mounted back of both the driving and driven gears to take the thrust. The intermediate gears turn on a stationary shaft keyed in the housing.

Three-point support is used, each of the jackshaft housings having a smooth-turned belt at which the transmission can be clamped to the frame, and the third point of support is at the forward end.

Efficient lubrication is provided for, as all gears operate in a bath of oil. This also takes care of the bearings. Transverse partition walls to both sides of the intermediate gears insure that the latter always dips in oil. Gear reductions are such that a plowing speed of 2 to 2½ m.p.h. is obtained, depending on the engine speed. As the plowing speed can be made either the high or the low speed, the extra speed will be either lower (about 1½ m.p.h.) or higher (3½ m.p.h.). The reverse, which is obtained by means of a pair of intermediate gears, is always equal to the low speed.

The Foote-Strite transmission is recommended for engines up to 30 hp. and weighs approximately 550 lb. ready for shipment. The sliding pinions are made from low-carbon steel forgings, case hardened and ground, while the large gears are made either of high-carbon steel or of drop forgings and case hardened. Either carbon or nickel steel shafts are used, and are cut with integral splines. Provisions can be made for braking on either side of the differential or on both sides.

An additional transmission for 30-40 hp. tractors has recently been added to the line and is known as No. 2 A. Hyatt roller bearings are used throughout in this transmission, even in the reversing gears. This transmission can be furnished to give either two or three forward speeds, and the three-speed design is herewith illustrated. In this design the range of speed obtainable is further increased by the possibility of interchanging or reversing the two gears of the high speed set.

The new gear shifting and locking mechanism is now used on all models of the Foote-Strite transmission. There are three shifting forks, one for each sliding pinion. The gear lever operates in a slotted plate and is provided with a locking quadrant which holds it in the neutral position or in the position of full mesh.

In conformity with the latest tendencies in tractor design the Foote company has brought out a combined transmission and rear axle, the housing of which will also serve the function of the frame. This is the new Model DU intended for tractors pulling three or four plows. It is for a live axle type of design and gives a ratio of 70 to 1 on low gear and 50 to 1 on high. There is an arrangement on the outside of the gearbox by which changing a set of gears gives a ratio of 82 to 1 on low and 58 to 1 on high. This change can be made, it is said, in five minutes. This new gearset weighs 1750 lb. and uses Hyatt bearings all through, except that there are two Timkens on the clutch shaft which carries the bevel gear.

Splined shafts are used throughout and all gears are of vanadium steel, except the two large diameter internal gears. The rear axle drive shafts of the set are 3 in. in diameter and are carried either on graphite bushings or Hyatt rollers. The set is designed for using tractor road wheels of 48 to 54 in. diameter. The complete set is suitable for tractors with a wheel base ranging from 84 to 96 in. according to the desires of the tractor maker.

Using this model of gearset a rear frame on the tractor is not needed, as the housing for the gearset forms the rear axle and the frame, so that the frame structure is limited to two side uppers which extend forward from the gearbox and support the engine.

*Foote-Strite transmission with spur gears only*

On the front of this gearset is used an S. A. E. No. 2 bell housing. There are but two bevel gears in the set. In connection with this gearset the spring drive in the rear wheel as shown on the Trojan tractor is used.

## British Exhibit of Enemy Aircraft

IN the Agricultural Hall at Islington, near London, where automobile shows were held in former years, there is now being staged a most interesting exhibition of captured enemy aircraft and engines. The exhibit is under the direction of the Controller of the Technical Department, Aircraft Production, Ministry of Munitions. It comprises examples of nearly all the types of German aeroplanes which have been captured during the war, and thus represents very completely the development of enemy aircraft design. The object served by the museum is twofold, firstly to enable designers and constructors to keep in close touch with what their German rivals are doing, and secondly to provide pilots and cadets with first-hand information which will not only help them to recognize hostile machines, but will also indicate their most vulnerable points. For these purposes all the aeroplanes are treated in the same manner, one-half being entirely stripped so as to expose any structural detail, the other half left intact. Among the numerous exhibits may be mentioned the Friedrichshafen and Gotha bombing planes, the Fokker biplane and triplane scouts, and the Hannoveraner and Halberstadt fighters.

WE are in receipt of a copy of the Cleveland Worm & Gear Co.'s catalog of Cleveland worm gear drives. This catalog, in addition to an exposition of the company's product, contains much tabular matter of use to the designer. There are charts and formulæ for determining worm and worm wheel bearing loads, a table of English and metric equivalents, a collection of rules for the solution of problems connected with right angled and oblique triangles, and numerous mathematical tables.

# What Langley Did for the Science of Aviation

Seven Years After Langley's Death His Theories Were Fully Vindicated by a Successful Flight Made by the Langley Man-Carrying Aerodrome Piloted by Glenn H. Curtiss

## PART IV

**I**T WAS seven years after Langley's death, or in the spring of 1914, that the world first knew that he had accomplished what he had set out to do.

For ten and one-half years he had struggled with the development of the basic science of mechanical flight, had made exhaustive experiments and countless tests, only in the end to meet with what was regarded by all except himself and those close to him as very little short of ignominious failure. Judged by an unenlightened press whose influence with those who could have provided the means for continuing Langley's experiments was sufficient to shut off further funds, his work in aviation terminated with the failure in December, 1903, to fly his man-carrying machine, which was later demonstrated to have been scientifically correct and capable of performing what it was built to do.

In March of 1914, eleven years later, Glenn H. Curtiss was invited to send one of his flying boats to Washington to take part in the celebration of "Langley Day." In response to this invitation, Curtiss replied that he would like to have the opportunity to fly the Langley aerodrome itself on that occasion, and he was finally permitted to have the original machine shipped to his plant in Hammondsport, N. Y., there to be put into condition for further tests and for flight, if possible, either with

its original power plant or with a more modern one of Curtiss' design.

The machine was shipped the following month, and a month later, with re-covered wings, was ready for its first trial since the accident which terminated Langley's experiments.

It was the purpose of these new trials, first, to show whether the machine, as Langley had designed and built it, was actually capable of sustained free flight, carrying a pilot, and also to learn more fully whatever advantages there might be in the tandem type construction. Both of these objects were accomplished, and it was found that Langley had indeed produced a successful flying machine.

In his attempts to fly the aerodrome, Langley, as has been recorded in previous articles in this series, made use of a launching device, built on the roof of a houseboat which was anchored in the middle of the Patomac River. The aeroplane was supported on a car which was drawn swiftly along the launching track by means of long spiral springs and, through the medium of an automatic releasing device, was suddenly dropped from the end of the track, free in the air. Careful consideration was given by Mr. Curtiss to this method of launching, and, while he considered it a practical plan, he did not consider it

Langley man-carrying airplane (built 1898-1903) ready for launching at the Curtiss Aviation Field, Hammondsport, N. Y., May 28, 1914

and Doherty  
g the water  
ember 17,

ngine and a  
or propeller

to adopt it. He also considered starting the aeroplane from the ground, by means of wheels, from the ice, runners similar to those of an ice-boat, and from the water by means of floats. The last method was adopted.

Description of the machine when it was ready for its tests at the Curtiss plant at Lake Keuka is given

A. F. Zahm: "The steel main frame, the wings, rudders, the engine and propellers all were substantially as they had been in 1903. The pilot had the same under the main frame, and the same general system of control as in 1903. He could raise or lower the craft by turning the big rear rudder up and down; he could turn right and left by turning the vertical rudder.

It had no ailerons nor wing-warping mechanism, but lateral balance depended upon the dihedral angle of the wings and upon suitable movements of his weight or the vertical rudder, and herein it may be noted that they had placed the vertical steering rudder under the rear of the center of gravity. So placed, it acted as a fairly good aileron by exerting a turning moment about the longitudinal axis of the machine."

May 28, 1914, after adjustments had been completed and with a light breeze blowing, the aeroplane was placed upon the water by a number of men who waded it from the bank and waded in to a sufficient depth so that it would clear the land, the engine, which was the original Langley power plant, was set going, and with Curtiss at the wheel, the large tandem-winged craft sailed off over the water, across the wind for a short distance and then, acting automatically, headed into the wind and rose into the air, soaring for about 150 ft. and then gliding lightly again upon the water. In this short flight Curtiss decided that the large rear rudder should be able to turn on a vertical as well as on a horizontal axis as the pressure of the wind against it made the machine act as a weather-vane and it was difficult to be impossible to steer in any direction except head into the wind.

Following this initial trial, several other short flights were made with the machine equipped with the original Curtiss engine and twin propellers, but, as the engine never developed the power which had been obtained from it in tests made by Langley in Washington, it was taken to Lake Keuka and a Curtiss 80-hp. engine with direct-connected propeller was substituted.

Equipped by Langley, the total weight of the ma-

chine and pilot was 830 lb. The floats added for the experiments at Lake Keuka brought the total weight to 1170 lb., and with the Curtiss engine substituted for the original power plant, the total weight became 1520 lb. This gave a total added weight above the original weight of approximately 85 per cent, but during the experiments the wing spars and ribs, although designed for a much lighter load, stood the added strain without any evidence of giving way under it.

For several reasons which it is not necessary to recount here, as they had to do with matters entirely independent of the machine itself, work was suspended on the Langley plane at the Curtiss plant until the following September. At that time, in the absence of Mr. Curtiss, Elwood Doherty, a pupil in the Curtiss Aviation School, volunteered to act as pilot in further tests, and on the afternoon of Sept. 17 he succeeded in flying for about 450 ft. at an elevation of two or three yards.

A few days later, using a 9-ft. screw, Mr. Doherty made a number of longer flights in a breeze which was sufficient to ripple the surface of the water without causing whitecaps. A description of this flight is given by Dr. Zahm in his account of these experiments: "A dozen workmen, lifting the great tandem monoplane from the shore with the pilot in his seat, waded into the lake and set it gently on the water. A crowd of witnesses near at hand, and many scattered about the shores and on the lofty, vine-clad hills, stood watching expectantly. When some of the official observers and photographers, in a motor boat, were well out in the lake, a man in high-top boots, standing in the water, started the propeller and stepped quickly out of the way. Then with its great yellow wings beautifully arched and distended, the imposing craft ran swiftly out from the shore, gleaming brilliantly in the afternoon sun. At first the floats and lower edges of the rudders broke the water to a white surge, then as the speed increased they rose more and more from the surface. Presently the rear floats and the rudders cleared the water, the front floats still skipping on their heels, white with foam. The whole craft was now in soaring poise. It quickly approached the photographers, bearing on its back the alert pilot, who seemed to be scrutinizing every part of it and well satisfied to let it take its race. Then it rose majestically and sailed on even wing 1000 ft.; grazed the water again, rose and sailed 3000 ft.; turned on the water and came back in the same manner; and, as it passed the photographers, soared again

Flight of Langley airplane above Lake Keuka, September 17, 1914, piloted by E. Doherty and driven by a Curtiss engine and tractor propeller

nearly half a mile. The flights were repeated a few minutes later, then, owing to squally weather, were discontinued for 11 days."

Following these flights came others, on other days, of 1000, 2000, 2250 and 3250 ft. at altitudes averaging better than 30 ft. No longer flights were attempted, as it was not deemed wise to run the risk of injury to the machine, especially as this risk was increased through carrying an excessive overload. The fact that the machine would fly was clearly demonstrated and it was also proved beyond the semblance of a doubt that Langley had actually produced a machine which would have flown but for a minor accident, which, had it occurred to-day, would be regarded as insignificant.

Records of engine tests made by Langley and Mr. Manly, who was associated with him, showed that a static thrust of 450 lb. had been obtained. At Hammondsport, however, the output of the engine fell nearly 100 lb. short of this amount. If, therefore, the engine and propellers could have been restored to their original

working condition, they would undoubtedly have been able to drive the machine in flight even with its aggregate weight at that time of nearly 1600 lb., or about double that which it was designed to carry. With the extra weight removed and with the engine developing a thrust of 450 lb. as it had in its early tests, the Langley aeroplane would have been able, the experiments at Lake Keuka clearly demonstrated, to have carried a man and sufficient supplies required for a flight lasting nearly a whole day.

Dr. Langley's work may be briefly summarized as follows: His experiments were sufficiently complete to form a basis for practical pioneer aviation; he built and launched in 1896 the first steam model airplane capable of prolonged free flight; he built the first internal combustion engine suitable for a man-carrying machine; he developed and launched successfully the first gasoline model airplane capable of sustained free flight, and he developed and built the first man-carrying airplane capable of sustained free flight.

# British Airplane Activity

Operations Undertaken in Four Main Theaters of War, Extending from the Belgian Seacoast to the Mountain Fastnesses of Samaria and the Rim of the Syrian Desert

WASHINGTON, Nov. 1.—During a recent week British airmen have been heavily engaged in the four main theaters of war, from the Belgian coastal sector of the north to the rocky defiles of Samaria and the fringes of the Syrian desert. The heaviest air fighting has taken place north of the Arras-Cambrai road, where large enemy air forces have been thrown into the battle. On this front, in addition to dropping nearly 140 tons of bombs and firing an immense number of rounds of small-arms ammunition, British airmen have destroyed 69 enemy machines and driven down 24 out of control. Five hostile machines have also been brought down by anti-aircraft fire, making a total of 98 enemy aircraft accounted for on the British western front during the week. In the same period 46 British machines were reported missing.

On the Rhine front the R. A. F. Independent Force has discharged a heavy weight of bombs upon enemy railway and industrial centers in the course of 22 successful raids into German territory. In all, 511 tons of bombs were dropped during the week upon the railways at Frankfort, Treves and Metz-sablon, blast furnaces at Hagendingen and Rombach, the Lanz Works at Mannheim, factories at Burbach and Karlsruhe, and the hostile aerodromes at Boulay, Frescaty, Morhange, etc. Many direct hits were observed both at Treves and Mannheim, while extensive fires were started at Metz-sablon, Karlsruhe and among the hangars at Frescaty and Morhange, although necessarily upon a smaller scale than in the West.

In Palestine, during the past week, contingents of the Royal Air Force and the Australian Flying Corps have been carrying out reconnaissance upon a wide scale over the maritime plane, stretching from Mount Carmel to

the Shechemjopha road, as well as over Samaria and the Valley of the Jordan, from the edge of the Judæan plateau to the Sea of Gallilee.

On the Italian front, in addition to much valuable reconnaissance and photographic work done, successful air fighting has taken place. During the week 6 enemy machines have been destroyed and 3 driven down out of control. All British machines returned safely.

*The photographs reproduced herewith were taken by the crews of British reconnaissance machines. The upper one is a scene along the battle front and shows eight allied tanks proceeding toward the German lines, four of them running abreast while the others are scattered. The lower photograph shows a fleet of motor trucks lined up along the curb in the center of a village*

# Maybach 300-Hp. Aircraft Engine

## PART II

### Details of the Valves and Valve Gear and Design of the Crankshaft and Crankcase

**T**HE twin inlet and exhaust valves work vertically in cast-iron valve stem guides in the cylinder heads, and are operated by rocker levers mounted on roller bearings, each pair of valves being operated by a single tappet rod from one of the camshafts in the crankcase.

**Valves**—The heads of all the valves, both inlet and exhaust, are of the same diameter, i. e., 54 mm., and the angle of the valve seats is 30 deg. in each case.

The inlet valves are machined concave under the head, and are formed with a 20 mm. radius between the valve stem and the head. The exhaust valves are convex in the head, and are made with a compound radius between the valve stem and the head of 9 and 25 mm. The diameter of all the valve stems is 11 mm., the clearance in the guide bushes being 0.12 mm. (inlet) and 0.15 mm. (exhaust) (cold). The ends of the valve stems are fitted with hardened steel disks, which are bedded in the recessed ends of the stems.

The inlet valves are 136.5 mm. long overall, while the exhaust valves are 152.5 mm. in length. The exhaust valves are made longer to allow for the extra water cooling space in the cylinder head above the exhaust valve pocket already referred to.

All the valve springs, however, are of exactly the same length, i. e., 52.5 mm. free, and measure 39.5 mm. when in their position in the cylinder, initially compressed with no valve lift. The diameter of all the valve springs is the same, 51 mm. (central diameter of coils), and the gage of wire is 5.22 mm. in all cases.

Fig. 9—Cam layout diagram

Fig. 10—Valves and valve gear

Figs. 10, 11, 12 and 13—Diagrams of valve lift, velocity and acceleration

The valve springs are fitted with plain collars at the top. These are secured by T-shaped cotters through the valve stems in the usual way. These are also locked in position with small wire clips, which are fitted to the spring cotters through two small holes. The surface of all the valve spring collars is galvanized or plated with a tin or zinc deposit of some nature, apparently to prevent corrosion. This form of galvanized exterior finish is carried out on several other parts of the engine.

Details of the valves and valve springs are given in Fig. 10.

**Valve Rockers**—The roller bearings carrying the spindles of the valve rockers are mounted in short brackets, each of which is attached to the cylinder heads by two 8 mm. studs and castellated nuts. The bearing brackets are steel drop forgings, and the roller races are, to a certain extent, permanently fixed inside the recessed heads of the brackets, and are covered by thin steel disks fitted over the front faces of the bearings, these being held in position by a form of mechanical knurling largely used in German aero engine manufacture. This mechanical process takes the form of spinning or riveting over the housing metal of the part by a series of accurately spaced indentations.

The hardened steel set screws for the adjustment of the tappet clearances are drilled with a 5 mm. hole in the center portion through the squared end only, and the usual form of transverse locking bolt is provided. The method of splitting the lever to provide for the locking of the tappet adjusting screw, however, is carried out in a somewhat unusual way. This is shown in the view of the rocker lever in Fig. 10, from

which it can be seen that the saw-cut is made from the tappet hole, which takes the tappet adjusting screw backward through the center of the rocker lever toward the rocker spindle.

A steel stud having a hardened hemispherical end, which makes the top joint of the valve push rod, is fitted on the outer lever of the valve rocker. These steel studs are driven tightly into the levers and are secured by small steel wire rings snapped over semicircular grooves cut in the top end of the spherically-ended studs.

The tappet push rods are made of steel tube 16 mm. outside diameter, and are fitted with hemispherical hardened steel cups at each end. These are fixed to the push rods by taper pins and weigh 0.48 lb. each.

Hardly any alteration has been made in the familiar tappet design. The tappets consist of hollow steel tappet barrels, which are plugged at the top ends by hardened steel caps. The tops of these caps are formed with hemispherical heads, which engage with the lower ends of the cupped push rods.

The hardened cam rollers are held in position by the grooves machined in the bottom ends of the tappet barrels. These grooves are made slightly more than a semicircle to prevent the roller from falling out. Side movement of the rollers is prevented by the tappet guides. The cam rollers are 15 mm. in diameter, and are bored with a 4.5 mm. hole.

Four small holes are bored radially in the sides of the hollow tappet barrels, which always carry a certain amount of oil, thus providing a very simple, efficient method of lubricating the tappet guides. These are made of gunmetal, and

Fig. 14—Crankshaft details

the general design is clearly shown in the cross-sectional drawings.

A vertical lug is provided on the top of each tappet guide, which forms the guide for the tappet barrel, and prevents it from rotating. Three oil grooves are machined inside the tappet guides.

**Cams and Camshafts**—Both the inlet and exhaust cams are of the same profile, although the valve lift is slightly greater for the exhaust valves, according to the valve lift diagram reproduced in Fig. 11, which has been calculated from the actual valve setting of the engine under test. This difference is due to the unequal tappet clearances. Details of the cam design are given in Fig. 9. The cams are made in pairs, machined from solid forgings. Each pair of inlet or exhaust cams is fitted to the camshaft separately. Each camshaft is provided with three key-ways, which are machined along the whole length of the shaft. The cam blocks are made with three keys cut inside the hole which is bored in the cam blocks, the keys being solid with the cams. The cam blocks are also fixed to the camshaft by taper pins to prevent lateral movement. The central portion of each cam block between each pair of cams is machined to a diameter of 49 mm.  $\times$  16 mm. in width. These portions of the cam blocks form the journals of the camshaft bearings. They run in plain phosphor-bronze bushes let into the top half of the crank chamber, and helical oil grooves are cut in the face of the bearing journals on the camshaft. Each cam block is also fixed in position in the camshaft by one 5 mm. setscrew, which prevents the cams from moving laterally in the keyways.

The five bronze bushes forming the camshaft bearings are pressed into the crankshaft bearing webs of the crank chamber. The front and rear camshaft bearings are fitted with a flange, and are detachable; they are twice the width of the other three on account of the camshaft driving gears which are fitted on the front end of the camshafts, and the magneto driving gears, etc., which are fitted to the rear ends of the camshafts.

The setting of the valves is shown in the accompanying diagram (Fig. 11), which shows the following valve positions, viz.: Inlet valve opens 8 deg. e.; inlet valve closes 35 deg. l.; period of induction, 223 deg.; exhaust valve opens 33 deg. e.; exhaust valve closes 7 deg. l.; period of exhaust, 220 deg.

Further details of the valve gear and cam design are given in the list of data at the end of this report, and in the following diagrams (Figs. 11-14.)

Details of the design of the crankshaft are given in the dimensioned drawing in Fig. 14. The crankshaft runs in seven plain bearings lined with anti-friction metal of the usual formation. All the journals are 66 mm. in diameter. The diameter of the crankpins is also 66 mm. The crankwebs are all of the same section, being 23 mm. in thickness and 95 mm. in width across the face. All the journals are bored 36 mm. diameter. The crankpins are bored 39 mm. diameter, the ends of the holes being plugged with the centrifugal oil scoops characteristic to the Maybach engines. (Details of these are dealt with later in the notes on lubrication.) The rear end of the crankshaft carries the extension shaft, on which is

mounted the wireless dynamo driving pulley, which embodies a friction clutch. This design of wireless pulley is a standard German engine fitting. Full details of its design and construction have already been issued in previous reports.

The extension shaft referred to above is a driving fit in the rear end of the crankshaft, which is bored 42 mm.; the extension shaft is locked by a 7 mm. taper pin. Two centrifugal oil-thrower rings are machined on the extension shaft. These details were shown in the general arrangement of the engine in last week's instalment.

The main driving bevel gear is fixed to the rear end of the crankshaft by a key 8 mm. wide by 5.5 mm. deep, half sunk in the shaft.

#### Detail of Crankshaft Design

An interesting point in the design of the crankshaft is found in the method of fixing the flange to which the propeller hub is bolted. The construction is clearly shown in the sectional arrangement of the propeller hub, from which it will be seen that a slight taper, 1 in 33.3, is machined on the front end of the crankshaft, onto which the propeller hub flange is very tightly driven. No key is fitted to the taper, but a grub screw 10 mm. diameter is screwed into the front end of the flange, the hole being drilled half in the flange and half in the crankshaft.

The grub screw is locked by the flanged head of a large plug of 40 mm. diameter, which is screwed into the hollow front end of the crankshaft. This flange, to which the propeller hub is secured by eight 14 mm. bolts with countersunk heads, is mounted on a large single race ball-bearing, 132 mm. outside diameter, behind which is fitted the double thrust ball race, 108 mm. diameter on the ball center diameter.

On the front portion of this propeller hub carrying flange is mounted a double oil-thrower ring, which is driven on to the outer diameter of a split collar or bush, as shown in Fig. 15. The driving gear for the camshafts is machined on this propeller hub flange; the teeth of the gears are integral with the flange, hence the splitting of the bush which carries the double oil-thrower rings.

The general details of the construction of the propeller hub are given in Fig. 15. Eight 15 mm. bolts are used to bolt the front flange to the two rear propeller hub flanges,

Fig. 15—Propeller hub and mounting

and the propeller is secured by castellated nuts in the usual manner. The surface of the propeller hub and flanges is galvanized with deposited tin to prevent corrosion. The front flange floats on the propeller hub in four castellations, 17 mm. wide by 3 mm. deep. The total weight of the complete propeller hub, with all bolts, less extension flange on end of crankshaft = 21 lb.

Unlike most of the enemy aero engines, the bottom halves of the crankshaft main bearings are bolted to the top half of the crank chamber. These are very deep in section, and are secured to the crank chamber by 19 mm. diameter bolts, which pass through the crank chamber, and are also used to bolt down the cylinders by means of triangular clamps, now almost standard practice. Flanges are machined at the top end of the holding-down bolts, which are let into recesses cut in the top face of the crankcase. The front main bearing cap also carries below the intermediate gear pinion for driving the oil pumps as shown in the general arrangement of the engine. Cast aluminum covers are bolted to the front and rear ends of the crankcase for enclosing the camshaft driving gears at the front ends, and for the magneto and interrupter gears at the rear end of the engine. Further details of the crankcase construction are shown in the illustrations.

The lower half of the crank chamber presents several points of interesting design, and is of simple construction, weighing 41.32 lb. bare. At the rear end of the flange, which is bolted to the top half of the crank chamber in the usual way, extended brackets are cast for taking the two magnetos, and the three gear type oil pumps are situated on brackets cast on the bottom of the inside of the base chamber.

The small detachable oil sumps are fixed to flanges cast on the under side of the base, one at each end.

Details of the construction of the oil pumps and detachable oil sumps are given in the notes on lubrication.

Fig. 17 (left)—Crankcase breather. Fig. 18 (right)—Oil scoop which fits to crank arm

As in the Zeppelin-Maybach engines, the efficient ventilation of the crankcase has received careful consideration. The design is, in fact, very similar in both types of engine. On the induction side of the engine six breathers are fitted; these are constructed of fairly coarse brass wire gauze baffles mounted in sheet aluminum breathers which are attached to short steel tubular connecting lugs screwed into the crankcase, and are fixed in position by steel wire clips. Details of the construction of these breathers are shown in the sketch, Fig. 17.

(To be continued)

# The Owen Automatic Lighting and Power Unit.

Engine Started Automatically When Battery Charge Runs Low and Stopped When Charge Is Complete—Also Started When Load on Battery Exceeds Normal Discharge Rate—Load Circuit Opened When Load Is Excessive

By P. M. Heldt

**A** SELF-CONTAINED electric generating unit suitable for farms and country places is manufactured by R. M. Owen & Co., New York. It comprises a single cylinder, vertical gasoline engine, direct-connected to a four-pole electric generator; a 32-volt, 80-ampere-hour storage battery and a switchboard containing apparatus for the control of the system.

The feature of the system is its automatic control. When the battery charge, or discharge, reaches a certain predetermined value, the engine is started up automatically. When the battery is fully charged the engine is stopped automatically. If the engine stops for any reason, as, for instance, the fuel supply becoming exhausted, the battery current is shut off from the generator automatically. If an overload is thrown on the battery, the engine is automatically started up and takes care of the load up to the capacity of the generator, after which the battery also supplies power if the load requires it, but if there is not sufficient load to absorb the capacity of the generator, the surplus current is stored in the battery. In other words, the engine runs at its full load all the time it is running, and all the current used on the line goes direct to the line and not into the battery, but the surplus goes into the battery. If too much load is thrown on for the generator and battery combined, the load circuit will open automatically.

The gasoline engine is of interest because of the silent rotary valve which it employs. The engine is of 3-in. bore and 4-in. stroke and is governed to run at 1300 r.p.m. Its crank is formed on the end of the armature shaft, the crank pin being secured to the crank arm by a tapered fit and nut. The connecting-rod head is

solid and contains a cylindrical roller bearing. An aluminum alloy piston is employed, together with leak-proof piston rings.

Although the crank case is of very large volume, the up-and-down motion of the piston causes a variation in the pressure within the crank chamber, and as the latter is partly filled with oil, there is a tendency for the oil to be forced out with the outflow of air as the piston comes down, reducing the volume of the crank case and increasing the pressure therein. To prevent this a breathing device is provided on the circular plate closing the end of the crank case.

The silent valve is of the tapered type and is self-adjusting for wear and for differences in heat expansion. It is driven through a vertical shaft at one-quarter crankshaft speed. The shaft extends through the valve and near the upper end carries a quick-pitch screw engaging a corresponding female screw thread in a ring nut

screwed into the valve. A coiled torsion spring anchored to the timer disk on top of the valve shaft tends to screw the valve down on the shaft and onto the valve seat. On the other hand, the friction between the valve and the seat tends to screw the valve up on the shaft and out of the seat. By this arrangement two important advantages are secured. In the first place, if the valve expands more than its seat, as it naturally will when the engine heats up, the increased friction of the valve in the seat will cause the valve to unscrew or rise slightly in its seat, and thus relieve the friction. The general effect is to maintain a constant pressure between the valve and its seat, fixed by the setting of the spring. Secondly, as the valve and its seat wear,

*Owen lighting and power unit for farms and country places. It comprises a single-cylinder upright engine with a rotary valve, an electric generator of 1250 watts output, and a switchboard which insures automatic control*

the resulting looseness is automatically taken up by the spring. Of course, the spring force would become slightly less as the valve sank deeper into the seat, but the reduction would be negligible for ordinary wear, and, besides, if it should become necessary, the point of anchorage of the spring could be changed. The wear is said to be practically nil.

There are two wide, oppositely located ports in the valve. These do not extend through the valve, but are in the form of pockets which at the proper moment place in communication a passage from the cylinder, with the inlet port and then with the exhaust port in the valve seat. Thus, each port or pocket in the rotary valve serves alternately for the inlet and the exhaust. The result is that these ports are cooled by the incoming cool charge and the charge is raised in temperature, whereby the fuel is maintained in the gasified condition.

The oiling system of the whole outfit is automatic. A supply of oil is maintained in the engine crank chamber and is circulated by means of an eccentric pump located at the bottom of the vertical valve shaft. There is direct feed of oil to the long main bearing between the armature and the engine crank. This shaft is chambered out and a drilled passage leads from its oil pocket diagonally through the crank arm to the roller bearing on the crank pin. An oil delivery pipe runs up the side of the engine and divides into two branches, one branch leading to the valve pocket and the other to the outboard generator bearing. The rotating valve has an oil hole drilled at one point of its circumference near the top, and every time this oil hole registers with the oil hole in the valve seat, a small amount of oil is forced through it into the space above the valve. The valve, therefore, is always well oiled, and it is a noteworthy fact that in spite of this copious supply of lubricant to the valve, there is absolutely no smoky exhaust, except for an instant when first starting. Each bearing is provided with an oil return passage to the oil well. An oil gage at the side of the well indicates the amount of oil in the machine.

It will be noticed that the helical gear for operating the vertical valve shaft is located in a pocket formed at the middle of the main bearing and is therefore well taken care of as far as lubrication is concerned.

The carbureter is a Schebler, mounted adjacent to the valve pocket, with which it communicates through an inlet pipe containing a barrel type throttle valve. This throttle valve is acted on solely by a fly-ball governor mounted on the vertical valve shaft. The governor spring is located on top of the throttle valve and the governing speed can be quickly adjusted by means of a screw with check nut on top of the inlet pipe.

Ignition is by jump spark with current from the stor-

*Horizontal section through cylinder and valve*

age battery. The spark plug is screwed into the center of the air-cooled cylinder head, which latter in turn is screwed into the cylinder. A special form of timer has been evolved for this engine. On top of the valve shaft is mounted a steel disk which carries two oppositely located hardened steel rollers. These make contact with an insulated member secured into the side wall of the valve cover. There is a large glass window in the cover plate of the valve cover, so that the action of the timer and the feed of lubricant to the valve can be observed. Incidentally, the timer disk, which may be seen through this window, is the only moving part of the outfit that can be observed when the engine is running. Spark timing, of course, is fixed, but adjustments can be made by revolving the valve housing cover.

Cooling is by thermo-siphon circulation, and the cylinder jackets and connecting pipes are of large cross-section. The cellular radiator is a single iron casting, but as regards form, it comprises two parts, the lower circular in outline, behind which the cooling fan is mounted, and the upper of the general shape of a conventional automobile radiator.

The lower circular part conforms in diameter to the engine fly-wheel housing and a generator shield of perforated metal extends between the fly-wheel housing and a flange on the lower part of the radiator forming the fan housing. In order to permit of continued operation of the outfit without serious loss of water, a condenser designed for attachment to the wall at some distance above the radiator is connected to the top of the latter. This returns any loss by evaporation to the cooling system.

The engine fly-wheel is designed with fan-shaped spokes, and both the fly-wheel and the radiator fan draw air through the perforations of the generator shield, forcing it through ventilating holes in the engine housing and through the radiator respectively. The fly-wheel fan draws its air through the generator, thus helping to keep the latter cool.

The generator is of the four-pole type, and carries four brushes. Its field frame is of cast iron, flanged outward at the engine end to join the fly-wheel bell-housing, and having the bearing bracket for the commutator end cast integral with it. This bearing, by the way, is supplied with oil through a special lead from the pressure oil pump. There is a knife-edge type of oil guard at each end of the bearing and a common return from the two oil guard grooves to the oil well.

There are three independent windings on the field poles of the generator, which, however, are formed and taped up into a single coil. One is the main shunt winding, another a small series winding serving to maintain the voltage constant, irrespective of the load on the generator, and the third is an additional series winding serving

only while the generator is used as a motor in starting up the engine. A series field winding gives a much stronger field in starting than a shunt winding, consequently the motor draws less current from the battery in starting the engine than it would if only the shunt and small compounding series coil were provided, thus protecting the battery. The small series coil, moreover, carries only current delivered by the generator to the lamp or other load and not current passing between the generator and battery.

What is known as the Strong automatic system of control is used, whereby the engine is started and stopped automatically to keep the battery charged and to take account of various other conditions.

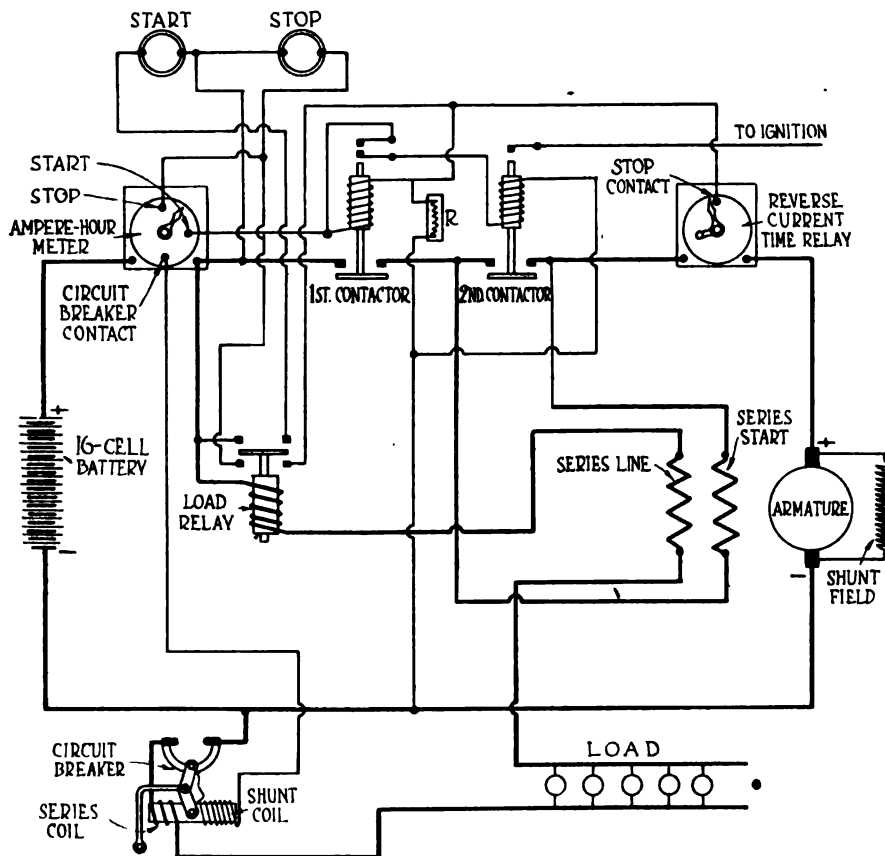

To first start the engine the button switch marked "Start" is pressed for an instant. This connects the solenoid of the "first contactor" across the battery, and this contactor, which is really the main switch, is closed. Current from the battery then flows through the starting series field winding and the arma-

Above—Valve and valve gear, carburetor, inlet pipe and governor. Below—Radiator and fan

ture of the generator, and the latter starts-up as a motor. The first contactor also controls the circuit of the second contactor, which latter cuts out the starting series field winding and closes the ignition circuit. Thus when the spark is turned on, the engine already has attained a considerable speed and the shock of the explosion on the bearings is reduced. As the generator increases in speed, its voltage surpasses that of the battery, and charging begins. It will be noticed from the wiring diagram that the compounding series field coil is so connected that only current flowing through the load (i. e., lamps, motors, etc., connected to the outfit) passes through this coil. Included in this circuit is a so-called load relay which when the load on the battery exceeds the normal discharge rate of same, closes a switch connected in parallel with the starter button switch and thus starts the engine.

Two ampere-hour meters are included in the control system, one serving to start and stop the engine as the battery becomes nearly discharged and charged respectively, and the other to prevent running down the battery in cranking the engine, if the latter for any reason cannot pick up its cycle, as when there is no gasoline in the tank. Both charge and discharge currents pass through these meters and the meter hands revolve in opposite directions, according to the direction of current. But as the number of ampere-hours which it is possible to obtain from a battery during discharge is smaller than that which is sent into it during charge, a compensating device is incorporated in the meters which causes them to run faster for a certain discharge current than for the same charging current. The dial of the meters is not graduated in terms of ampere-hours, but in decimal fractions of the battery capacity. The meter hand of the charge and discharge meter serves as a switch lever making contact with contacts on the dial, the hand and

Circuit diagram of Strong automatic control

start contact forming a switch connected in parallel with the starting button switch. The start contact on the ampere-hour meter dial is adjustable and may be set to cause the starting circuit to be closed when the battery charge is down to 20 per cent, 30 per cent or any percentage desired. Thus when the battery charge is depleted to this extent, the engine is automatically started and charging begun.

As the charging proceeds the ampere-hour meter moves around in a left-hand direction, and when the battery is fully charged, it establishes contact with the stop contact on the meter dial. This action de-energizes the coil of the first contactor, causing it to open and thereby stop the engine and generator. The same effect can be produced by pushing on the stop button switch, this latter being connected in parallel with the stop contact on the ampere-hour meter hand and the stop contact on the reverse current meter.

The other ampere-hour meter or reverse current meter shown on the right in the diagram serves to prevent exhaustion of the battery in cranking when the engine won't start. The meter arm is held in place on the stem by means of a friction clutch which allows it to slip. All current flowing from the generator to the battery, and vice versa, passes through it. Ordinarily, while the battery is being charged, the hand is restrained by a stop and the stem slips inside its hub. When the generator draws current from the battery in cranking the engine, the meter hand revolves the opposite way, and if this continues for any length of time the hand comes to a stop contact on the dial, when it makes the same electrical connection as the stop button switch, disconnecting the generator from the battery.

Reference was made above to the load relay which starts up the engine as soon as more current is drawn from the battery than its normal discharge rate, and

as soon as the engine begins to fire, most, if not all, of the load, is shifted from the battery to the generator. One reason for starting up the engine as soon as considerable current is required is that it is more economical to supply this from the generator direct than through the intermediary of the storage battery. At light loads, on the other hand, say only four or five lamps, it is more economical to draw the current required from the battery, unless additional current can be used to advantage for charging.

It is conceivable that so much load be thrown on the circuit that the battery and generator connected in parallel cannot supply the necessary current without being overloaded. This contingency is provided against by means of an overload cut-out in the load circuit. All of the control mechanism is mounted on a switchboard located on top of the generator.

Compensation for variation in load is very effective. There is hardly a quiver in the voltmeter hand under variable lamp load. When the battery is fully charged, the outfit has a capacity sufficient to supply current to 100 20-watt lamps for 8 hours. When only a few lamps are being used, motors up to 1¼ hp. can be run by current from the set. The generating unit occupies 22½ x 32½ in. floor space.

On Nov. 1 one of the sets was given a 1-hr. full-load test in the presence of the writer. The set delivered an output of substantially 1250 watts throughout the period of the test and ran smoothly from start to finish without signs of undue stress in any part.

## South American Trade Mark Laws

Editor, AUTOMOTIVE INDUSTRIES:

We have read with very considerable interest the article appearing in the issue of your paper, AUTOMOTIVE INDUSTRIES, of Aug. 1, 1918, regarding the Patent and Trade Mark Laws of the Argentine.

We may say we have already experienced the hardship of finding we are unable to sell our manufactures in the Argentine under our own trade name, which is well known throughout the world, due to the fact that the same name was registered by a firm of merchants in Buenos Aires prior to our entering that market, and although they have never utilized the name in connection with any articles of the class we manufacture, their action prevents us using our own name.

This same difficulty and extreme hardship has been experienced by many other firms in this country trading with the Argentine, and the matter has been before our Board of Trade and Chambers of Commerce in Glasgow and London on many occasions, but so far we regret with little effect, as there appears to be some difficulty in getting the Argentine authorities to move in the matter.

It appears to us, however, that if a joint representation was being put forward by the authorities in America and Great Britain and possibly including also our other allies at this time, very considerable pressure could be brought to bear on the Argentine Government to amend their trade mark law so that it would work out more equitably.

The great changes, both economical and political, which are bound to result as the outcome of the present war should offer a suitable opportunity for this matter being made a subject at least for negotiation.—"A British Motor Manufacturer."

## Effect of Aircraft Experience on Post-War Automobile Design

RECENTLY there has been considerable speculation as to the effect of aircraft engine experience on automobile engine design after the war. It is apparent that the aero engine marks a great advance over the automobile engine in point of weight efficiency, and it also greatly excels it as regards fuel efficiency. However, while both of these improvements would be very desirable in automobile engines, their realization in that type of engine would be a matter of great difficulty if not impossibility. There is one inherent difference between the conditions governing aircraft engine practice as we have known it during the past several years and those governing automobile practice. No commercial considerations have entered into the former and a slight improvement in performance was worth almost any increase in cost. In automobile work, however, commercial considerations are paramount. A certain gain in weight efficiency

or fuel efficiency is worth while only if it does not increase the manufacturing cost too much, and if we compare the price per horsepower paid for aviation engines with that paid for automobile engines before the war and bear in mind that this cost figure is naturally higher the smaller the engine, it becomes apparent that it will be next to impossible to apply the principles of design and manufacture of aero engines to the ordinary automobile engine.

What is more likely to take place is that a few companies catering to a select clientele who want something out of the ordinary and are willing to pay for it will adopt the aero type engine for automobile purposes. Lightness combined with high ability has always been a desideratum in automobiles, and the successful introduction of the aluminum engine before the war was based on this fact. The lightness of the aero engine is largely due to the use of steel for cylinders and the complete machining of all parts. It is quite possible that steel cylinders will be adopted for automobile work to a limited extent. In former years there would have been some prejudice against steel, owing to uncertainty of its wearing qualities, but the perfect satisfaction it has given in thousands of aero engines under all conditions has set all questions regarding its serviceability at rest.

Crankshaft and connecting rods were completely machined on some high priced automobiles even before the war and the lowest possible piston weight was aimed at by a great many designers. Methods of cutting down weight in machined parts have been further developed in airplane engine work and we may expect to see advantage of this being taken in automobile engine design during the coming years.

## The Maybach Engine Article

WE wish to call attention to the description of the Maybach 300-hp. aircraft engine which was begun in AUTOMOTIVE INDUSTRIES of Oct. 31 and is continued this week. This was issued by the Technical Department of the British Ministry of Munitions and is probably the most detailed description of an aircraft engine ever published. The instalments of the article will continue through at least two more issues, the descriptive text being followed by a series of tables containing test results of different parts, analyses of materials employed in the construction of the engine and the weights of all individual parts.

Information of this sort cannot fail to be of great help in the further development of aircraft engines, and the British Aircraft Production Department is to be congratulated on the excellent character of the material it has issued from time to time.

Presumably the German papers have also had technical descriptions of the newer allied engines, and we have heard it said that a many-page description of the Liberty engine appeared in one of them. However, no German papers are available in this country at present and the English papers, which continually carry abstracts or translations from German aircraft papers, have not mentioned it.

# Necessary Aircraft Waste

**W**HILE so very much has been written and so very much more said, regarding the delays and failures in the U. S. aviation program, little has been heard of the actual working out of aviation problems in France and England.

As yet it is not possible to give any detailed information of failures on the part of our allies, but it may be said and should be made clear that all has not run smoothly on the other side of the water.

A moment's thought shows that with so new a thing as aviation, programs could not be written down and followed up like a program for motor vehicles or typewriters. It is stated, and stated truly, that much time has been wasted in deciding what types of planes to make. It has, but these decisions are not reached much more quickly in Europe. The record of experiments which have never come to anything in England, in France and even in Germany, would fill a large volume.

How could it be otherwise? The airplane at the outbreak of war was but a toy compared to what it is to-day. It has been improved out of all recognition by experimentation of the most daring kind, by the trying out of things which in more sober times have been regarded as barely sane.

It has been worth while to make twenty costly experiments if only one of them produces results. America's fault has been on the other side; America could have permitted *more* experiment.

At the very beginning of the program there was a widespread misconception—this being an almost universal idea—that France and England knew all about airplanes; that all the facts of the case could be found by consultation with French and British engineers.

There *were* no facts and there are no *facts* to-day. Not facts in the usual sense of the word.

A fact about the design of a plane is hardly ever more than a probability. Something accepted as basic to-day is reconsidered to-morrow and abandoned the day after.

Germany experimented less than France and England, especially in engine design. The result was that for a time German output of medium good machines was large, and though the Allies had some better planes they lacked the necessary quantity, but to-day, and for the past six months the very great superiority of Allied machines has told its tale.

England and France have not hesitated to put to use small numbers of experimental planes that looked good, have been content to order small numbers at a time.

This has delayed output, has led to the employment of a multiplicity of types but has had the highly desirable result of constantly putting over a surprise on the enemy.

If there had been a little more faith placed in American brains we would have had a fair number of fighting machines available last April; they would have been a mixed lot but they would have accounted for at least an equal number of Germans.

It is easy to be wise after the event of course, but the moral is that the British and French supremacy of the air has been won by permitting failures and, in a sense, "waste."

The time is very close at hand when the problem will be before us of turning to peaceful usage the vast amount of knowledge of aircraft we now possess. Let it be remembered that the airplane even now is no more ready for quantity production commercially than was the automobile of fifteen years ago. All is before us.

The Hughes report touches only upon production and gives no attention to the fact that the great, the enormous difficulty, has not been *production* but *decision*. The responsibility for choosing this or that design has been a burden, the weight of which will probably never be appreciated except by those who had to bear it.

Deferred liabilities .....	8,567,125	8,017,444	
Surplus .....			
Total .....	\$62,419,064	\$50,804,146	

DETROIT, Nov. 2—An analysis of the annual report of the Maxwell Motor Car Co. for the year ending July 31, 1918, in comparison with that for 1917, shows that the total assets for the present year amount to \$62,419,064, as against a total of \$50,804,146 for last year. The net surplus after deduction of charges is \$2,158,836, a sum which is equivalent to \$4.82 per share of common stock after 7 per cent on the first and 6 per cent on the second preferred stock have been deducted. In 1917 the company earned \$29.63 a share on the common stock.

Real estate, machinery and equipment are valued considerably higher than was the case in 1917, and inventories have increased by \$5,468,959. An advance to the Chalmers company is represented by an amount of \$2,398,115 and the accounts receivable are nearly double last year's

figure. Good will and patents are at a slightly lower figure and the cash item is over \$1,000,000 greater than last year's item.

On the liabilities side there is an item of \$2,333,377 reserved for depreciation, whereas last year no provision was made under this head. Government advances of \$5,614,944 constitute another item which had no counterpart in 1917 and a substantial reserve is now made for doubtful debts. The surplus brought from last year's report is \$8,017,444, and this year's total income is \$3,163,334.

The company is co-operating to the fullest possible extent with the Government in carrying out its war program, and this has caused a substantial curtailment in the production of passenger cars. As the fiscal year closed approximately 80 per cent of the total Maxwell capacity was engaged on war work and the remaining 20 per cent was available for passenger cars.

According to President W. L. Mitchell, it is impossible to estimate the probable profits from war contracts until the work is more nearly completed.

### Smith Motor Truck Sold

CHICAGO, Nov. 6—The business of the Smith Motor Truck Corp. was sold yesterday under the sheriff's hammer to a man named John Campbell. The sale wipes out the old indebtedness under which the company has been staggering and carries with it control of the name, good will, factory and material equipment of the corporation. It is generally surmised that Campbell represents one of the factions, or a coalition of factions, from among those which have been struggling for control of the company for the last two years or so. Whether the sale will result in a reorganization of the company and a resumption of business no one seems to know. A man who always has been close to the inside affairs of the company ventures the surmise that Campbell represents interests closely allied personally with the Central Bond & Mortgage Co. of this city. He concludes, furthermore, should this prove to be the case, that there is a probability of the men who first put the Smith Form-A-Truck on the map regaining control and attempting a rehabilitation of the business.

### Gordon Heads Selden Sales

ROCHESTER, Nov. 7—George R. Gordon was elected president of the Selden Truck Sales Co. at the annual meeting of the company, other officers elected being: Vice-presidents, Wm. C. Barry, R. H. Salmons, H. T. Boulden and W. F. Reynolds; secretary, E. B. Osborn; treasurer, F. J. Kolb. H. G. Strong and C. H. Stearns were elected directors.

## Conference Modifies Tractor Position

Restrictions on Production Have  
Been Partially Removed by  
Priorities Division

CHICAGO, Nov. 6—As a result of conferences between the War Service Committee of the newly organized American Tractor Association made up of the newer companies and the Priorities Division of the War Industries Board the following modifications have been made in the restriction on tractor production:

First—Tractor makers who, in the period from Oct. 1, 1917, to Oct. 1, 1918, had not received or placed bona fide orders for parts and materials, will be allowed to make a maximum of twenty tractors in the year ending Oct. 1, 1919.

Second—Tractor makers who, in the period Oct. 1, 1917, to Oct. 1, 1918, made less than ten tractors, and prior to Nov. 1, 1918, had in hand or had placed bona fide orders for materials and parts, will be allowed to use up such materials in the manufacture of tractors up to a total not exceeding one hundred machines by Oct. 1, 1919.

The War Service Committee has been recognized officially by the Priorities Division and has been promised further reconsideration with a view to letting down the bars on tractor production to the extent that conditions may make advisable. The association believes that, in view of the present war situation, the modifications mean tractor makers will be able to go ahead with their production plans in almost absolute certainty that before they have exhausted their allotment of materials they will receive permission to go ahead with their production programs without limitation.

### 3878 Libertys in October

WASHINGTON, Nov. 4—Three thousand eight hundred seventy-eight Liberty engines were produced in October as compared with 2378 in September, an increase of 1500. This increased production was made despite influenza, which threatened to hamper the output of the various factories. The quota set for September was 2500 engines and the actual number shipped was 2378. The quota set for October was 3000. The competition among the various factories has now become a race with each concern showing keen interest. The Nordyke & Marmion Co. of Indianapolis won the October pennant, which was sent to the factory in a DeHaviland Liberty plane from Detroit to-day. The quota of Liberty engines set for November is 4350.

# Automotive Industries

## Liberty Pennant for Marmon

**Presented With Production Championship—Bettered October Quota by 246%**

INDIANAPOLIS, Nov. 2—The Nordyke & Marmon factory won the Liberty engine production championship pennant for the month of October by turning out 308 airplane engines during the month. This was 246 per cent of its quota of 125. Five large concerns building Liberty engines entered into a competition Oct. 1 for an honor flag to be competed for each month, the flag to be awarded at the end of the month to the factory which produced the greatest percentage over its quota for the month. The factories in competition, aside from the Indianapolis concern, are the Lincoln Motors Co., General Motors Co., including Buick and Cadillac, Ford Motor Co. and Packard Motor Co.

By producing over twice its quota for the month, Nordyke & Marmon is awarded the championship pennant for the first month. This is to be held until some of the other factories show a greater percentage increase than Marmon for some month. This does not mean that the Indianapolis concern produced more engines than any others during the month, for some of the other builders had much larger production but a much larger quota.

Liberty engine builders altogether shipped 3878 engines during October, 878 more than the quota and 1500 more than the September shipment. November's quota calls for shipment of 4350 engines. Detailed production quotas of the five concerns are shown in the table herewith.

Award of the first championship pennant by the Bureau of Aircraft Production to the Marmon factory was made the occasion for a parade of Marmon workers, and a general celebration in Indianapolis this afternoon. The parade was over a mile and a half in length, comprising more than 4500 employees of the plant, through the streets of the city and to a park, where the raising of the championship pennant unveiled a Liberty engine. The active heads of Liberty engine production made inspirational talks to the employees. Among the speakers were Archer A. Landon, chief of production, Bureau of Aircraft Production, assistant to John D. Ryan, head of the aircraft activity; Lieut. Harold H. Emmons, of the Navy, chief of the engine production department, Bureau of Aircraft Production, and Major James G. Heaslet, Detroit district manager of the bureau.

Other notables in the aircraft production were present. Lieut.-Col. Jesse G. Vincent and Ralph De Palma flew over from Detroit. Major Marmon, of McCook Field; Mr. Kettering and Mr. Talbot, of Delco; Major Johnson, Bureau of Aircraft Production, and others, were present.

Liberty Engine Quotas

Company	September		October		November Quota
	Quota	Shipped	Quota	Shipped	
Nordyke Marmon Co.	100	59	125	308	375
Lincoln Motors Co.	850	687	825	1,050	1,125
General Motors Co.					
Buick & Cadillac Co.	450	193	325	558	600
Ford Motor Co.	800	811	900	1,059	1,375
Packard Motor Co.	800	628	825	903	875
Totals	3,000	2,378	3,000	3,878	4,350

### Mail Motor Trucks Prove a Success

WASHINGTON, Nov. 4—Cross country operation of mail motor trucks is proving very successful, according to James I. Blakeslee, Fourth Assistant Postmaster General. One truck route between Washington and Philadelphia without direct rail connections and costing \$800 monthly for operation has in 8 months paid a monthly revenue of \$16,000. Another route into Washington where 28 parcels daily were moved in the first month now shows a ton of traffic each way in every 24 hr. Seventy lines now operate over the country, all but one being east of the Mississippi River, and plans are being made for a complete system that brings up visions of \$360,000,000 yearly revenue, this amount being estimated provided the entire country is once properly established with a network of roads and truck routes.

Mr. Blakeslee plans to rebuild the thousands of Army trucks now in France after the war and to utilize these also for this work.

Nine million dollars has been asked of Congress for next year's appropriations for the development of the mail truck routes. Three hundred thousand dollars was allowed this year. Even this small amount, if it could be combined with the revenue that would accrue from the establishment of the routes, would be sufficient. However, it is expected that the revenue will continue to be diverted to the general Post Office funds and that instead Congress will pass the \$9,000,000 appropriation.

### Dorris Truck Price Advanced

ST. LOUIS, Nov. 4—The Dorris Motor Car Co. announces a new price on two-ton trucks, effective Nov. 1, of \$3,425. This is an advance of \$440.

## Would Cut Out Taxes On Exports

**Amendment Eliminates Impost Now Collected on Vehicles Sent Abroad**

NEW YORK, Nov. 7—It seems likely that the War Revenue tax imposed on cars for export will be eliminated. Under the terms of an amendment which has been proposed as an addition to the War Revenue measure now in the hands of the Senate and the House of Representatives, it is stated that vehicles sold or leased for export shall not be taxed.

Despite the fact that the Constitution specifically states that there shall be no tax on exports, the Treasury Department has ruled that cars and trucks sold for export are taxable under the provisions of the present War Revenue measure, which provides an impost of 3 per cent. The Treasury Department has ruled that such a tax must be paid when cars or trucks are exported in any one of four ways which have been previously outlined in AUTOMOTIVE INDUSTRIES.

The National Automobile Chamber of Commerce has repeatedly pointed out the unconstitutionality of such a ruling and has urged that the tax on vehicles exported be eliminated. It seems likely now that this will be done. Under the terms of the new War Revenue Bill in the House, vehicles are taxed 10 per cent and in the bill in the hands of the Senate, the tax is 5 per cent. Following is the text of the proposed amendment:

"Under such rules and regulations as the Commissioner, with the approval of the Secretary, may prescribe, a tax imposed under this title shall not apply in any respect to articles sold or leased for export, and in due course so exported."

### Consider Deeds Court-Martial

WASHINGTON, Nov. 6—The suggestions by Charles E. Hughes recommending court-martial for Col. E. A. Deeds and other officers mentioned were referred by Secretary of War Newton D. Baker to the Judge Advocate General of the Army yesterday for consideration and report. Mr. Baker stated also that he is reading the report carefully so as to be able to have the entire question in mind when any action is taken.

Col. Deeds and Gen. Squier and some of the other officers whose names have been mentioned have already asked for a court of inquiry. Ordinarily such requests are granted to determine if there is ground for a court-martial.

## Working Conditions Standardized

### Department of Labor Creates Three Service Divisions to Establish Uniformity

WASHINGTON, Nov. 4—The Working Conditions Service has been established in the Department of Labor to construct uniform standards for working conditions in all industries. For administrative purposes there are three divisions in the Service—(1) Division of Industrial Hygiene and Medicine; (2) Division of Labor Administration; and (3) Division of Safety Engineering. Since there are in operation other agencies with the specialized function of dealing with wages and hours as controversial questions between employers and employed, they will not be dealt with as such by this Service.

The Secretary of Labor at the request of the Working Conditions Service requested the Secretary of the Treasury to authorize the United States Public Health Service to detail personnel to the Division of Industrial Hygiene and Medicine of the Service. As a result of the agreement reached, Dr. A. J. Lanza, Past Assistant Surgeon of the Public Health Service, was detailed to act as Chief, Division of Industrial Hygiene and Medicine, Working Conditions Service. Dr. G. D. Selby, of Toledo, Ohio, will be at the head of the section of Industrial Medicine.

The Division of Industrial Hygiene and Medicine will direct the formulation of sanitary and health codes for industries. Co-operation with the United States Public Health Service will make possible extensive research work necessary to establish fundamental scientific principles as the basis for proper working conditions.

In addition to the work which the United States Public Health Service will perform for the Working Conditions Service, it is also authorized to do all inspections and investigations into matters pertaining to the sanitation of plants engaged on war work and into the health of workers in such industries, and into the sanitation and housing conditions surrounding the homes of war workers. In addition, the Ordnance Department of the War Department has delegated it the responsibility for mechanical safety in ordnance plants.

A field force of specialists in industrial hygiene, sanitation, safety and production engineering, technically trained and of broad practical experience, has been organized which will be under the supervision of Bernard J. Newman.

The Division of Labor Administration will deal with the attitude and policies of the management toward the employed and the personal relations between employers and employed. The chief of this section will be Dr. William M. Leiserson of Toledo, Ohio.

The Division of Safety Engineering completes the Working Conditions Service. Standards for mechanical safety

have been more adequately worked out than standards for sanitation and industrial hygiene. There are now in nearly all of the states of the Union safety codes and agencies charged with the establishment and maintenance of industrial safety. Supplementing Government agencies, the great energizing forces in this field have been the National Safety Council and various technical societies.

The policy of the Working Conditions Service is to avoid duplication of work and activity and, by acting as a co-ordinating agency, co-operate with the forces already in the field to bring federal directing impetus in the national campaign for uniformity of safety standards, practices and equipment standardization of safety organizations, and for the collection of data necessary for the continuous modification of standards to meet new conditions.

The Bureau of Standards has offered its co-operation in the formulation of codes. The assistance of the National Safety Council has agreed to co-operate with the Working Conditions Service and appointed a committee of five for consultation and advice. The codes which are to be worked out under the Division of Safety Engineering will be the result of experience and experimentation, consultation with technical organizations and conferences with employers and employees in order to ascertain the necessary practical modifications.

The Director of the Working Conditions Service is Grant Hamilton and the Assistant Director is Florence C. Thorne.

#### Priority for Gasoline and Kerosene

WASHINGTON, Nov. 2—Priority has been ordered by the Fuel Administration for gasoline and kerosene for shipments to the armies abroad. All producers of kerosene and gasoline have been notified that whenever they have orders both for civilian and war purposes they must give preference to the war business and will not be allowed to supply civilian requirements until all the military demands are first met. Following is the order issued by the Fuel Administration:

"No licensee engaged in the business of manufacturing kerosene or gasoline shall, without the consent of the United States Fuel Administration, make any deliveries of kerosene or gasoline to any customer or consumer, whether the licensee is under any contract to make delivery to such consumer or customer or not, if such licensee shall be in default in delivering kerosene or gasoline which such licensee may be from time to time directed by the United States Fuel Administrator to deliver for export for the United States Army or Navy or for the Allies."

#### No Tractor Show at Phoenix

PHOENIX, ARIZ., Nov. 4—Owing to the prevalence of Spanish influenza, the State fair, which was scheduled to open Nov. 11, has been called off. It was planned to have a tractor exhibition and demonstration in connection with the fair and a number of entries were already secured from tractor concerns.

## 200,000 Men Needed for Motor Corps

### Highways Transport Committee to Assist in Recruiting—Women May Be Enlisted

WASHINGTON, Nov. 2—The task of assisting in recruiting men for the Motor Transport Corps of the Army, which is now being organized along such comprehensive lines as to call for a force approximating 200,000 men and for motor transportation of the value of \$130,000,000 in addition to the value of such transport already in the service, has been assigned to the Highways Transport Committee, Council of National Defense, by General C. B. Drake, Chief of the Motor Transport Corps.

The carrying out of this assignment for one of the great branches of the war machinery means that the whole organization of the Highways Transport Committee, including the regional directors, the committees organized on its behalf by the State Councils of Defense throughout the country, and their local committees, will be given an increased share in the vital task of winning the war.

In order to prevent the disruption which would follow if tens of thousands of skilled men were taken away from the great organization engaged in operating and maintaining the industrial transport service of the country, and at the same time to provide an adequate force, it is necessary to work out for the Motor Transport Corps some plan to secure substitutes for those thus taken away.

#### May Recruit Women

One way of meeting this situation is by substituting women therefore for men, which involves recruiting these women and placing them in training for service while the men in the industry are being withdrawn for army purposes.

The problem which would inevitably develop in carrying out this plan of substituting women for men in the handling of industrial vehicles over the highways would include a determination of how many men in a given locality are employed on types of vehicle which might be adapted to handling by women, and, again, the adaption of the service of such vehicles so as to provide a satisfactory environment for female operatives.

The possible selection and training of women to take the place of men in the handling of various kinds of highways transportation, and simultaneously the selection and training of men whose age makes them unavailable for army service, will be conducted on the basis that these people are volunteers in much the same sense as are those who are entering the Army. In satisfactorily handling domestic transportation problems, which are necessary to the health and comfort of the civilian army in this country as well as an essential link in the trans-

portation system which supplies our war industries and the Army overseas, these volunteers will be doing their bit in a big way.

### Pedestrian, Too, Has Rights

BOSTON, Nov. 2—The full bench of the Massachusetts Supreme Court has just decided that pedestrians have a right in the street, according to a decision just handed down in an automobile case. George G. Miller was driving his car through Reading one night about 10 o'clock. The sidewalk was muddy and so two girls stepped out into the street and were walking there. While getting out of the way of an approaching electric car they were hit by Miller's motor car, which was on the way to Boston from Haverhill. At the time he was engaged in war work. At the trial the testimony showed that he was driving a 56 hp. touring car at a speed of from 35 to 40 miles an hour, although he claimed that his speed was only 20 miles. The two girls were badly injured, one getting a fractured skull and the other a broken leg after being carried 80 ft. by the car.

Judge John F. Brown, of the Superior Court, ruled that the young women were not exercising due care and he directed a verdict for Miller. The attorney for the young women filed exceptions and took the case to the Supreme Court. Chief Justice Rugg, in writing the opinion, said:

There can be no question that there was sufficient evidence of negligence on the part of the defendant Miller. He was violating statute 1909, chapter 534, sections 14 and 16. The speed at which he was driving might have been found to have been excessive and dangerous to other travelers. If the defendant had been traveling at a lawful rate of speed the young women would have reached a place of safety. Even if they did not pursue the wisest course in the light of what happened, that is not decisive against them.

The chief justice further added that the rights of an automobile driven in a public way are not superior to those of a pedestrian. This point will have an important bearing in many suits for damages in the future, for many motorists have contended that motor cars had the right of way on the thoroughfares except at cross-walks, etc.

### Boston Show Out of Question

BOSTON, Nov. 2—If the Boston Automobile Dealers' Association decided to hold a motor show next spring its plans would have to be altered now, for the officials of Tufts College have taken over Mechanics' Building as a barracks for the students who are training in its officers unit. And this unit will be held at the college during the regular college season, so that the barracks being part of the Government scheme of training any lease of the building for motor show purposes would have little consideration. As there is no other building in Boston suitable for a show it would not be possible now to have one.

## Non-War Industries Power Curtailed

### Factories Using More Than 100-Hp. Electrical Energy to Be Affected

WASHINGTON, Nov. 2—Non-war industries using more than 100 hp. connected load of electric energy from light or power companies will be curtailed in their use of this power by new regulations from the War Industries Board.

Preference will be given to consumers of more than 100 hp. connected load who are engaged in war manufactures and who will be placed in class 1. Consumers using 100 hp. connected load or less will also be placed in class 1, as it has been found that the inconvenience and damage they would suffer by curtailment would not be justified. Other industries not engaged in war work will be placed in class 2, 3 and 4, depending upon the importance of their products, and they will be rationed by the use of the following formula:

#### Formula for Rationing

(a) The aggregate kilowatt demands of each of the four classes of all industries and plants shall be approximately ascertained.

(b) The available supply of electric energy shall be ascertained.

(c) Should the available supply equal the requirements or demands, then the requirements of all industries and plants on the preference list shall be fully satisfied.

(d) But should the requirements or demands exceed the available supply of electric energy, then there shall be deducted from such supply the requirements of Class 1, 100 per cent of which must be delivered, and the remainder shall be prorated between Classes 2, 3 and 4, giving to each a per cent of its requirements in the ratio of 5, 3 and 2.

It will, however, sometimes happen, when class 2 or 3, or both, have extremely small requirements in proportion to the total requirements of the district that the formula will allot to one or both of these classes (2 and 3) an amount in excess of their respective requirements. In such a case the over-allotted class or classes should be given 100 per cent of their requirements and the balance of their allotment under the formula should be distributed either:

(a) Between the classes given incomplete service by the formula, in the ratio of their respective priority ratio (5, 3 or 2). This procedure is to apply where two classes are left incompletely served, or

(b) If only one class is left incompletely served by the formula, the over-allotments of the other two classes are to be assigned to the incompletely served class.

The allotment of more than 100 per cent under the formula to a small class of high importance shows that the shortage in the district was primarily caused by the large amount of less important work in the district, and that the small class or classes of higher importance should not be penalized, since they are not responsible for the shortage.

It is not practicable, and it is not intended, that an attempt should be made to apply this formula with literal and mathematical accuracy, but it will afford a workable basis for rationing industries and plants embraced within classes 2, 3 and 4, where the available supply, after satisfying class 1, is less than their aggregate requirements or demands.

### Consider Massachusetts Taxes

BOSTON, Nov. 4—The commission comprising the three members of the Highway Board, Col. William D. Schier, Frank D. Kemp and James W. Synan, and Secretary of State Albert P. Langtry, with Thomas W. White, supervisor of administration, appointed to delve into motor laws and report to the next legislature, have picked out Thursday, Nov. 7, for the first hearing. Letters have been sent to all the prominent motor dealers in Boston and a general invitation is extended to motorists, accessory men and others interested in the industry to attend and air their views. The committee hopes to get enough material together to frame such laws that will do away with the necessity of fighting before legislative committees year after year, as has been done in the past. While motor fees will be considered they will not be so important because of the fees and taxes of the National Government. But headlights, the weight of trucks and other topics will get consideration.

President John H. MacAlman, of the Boston Automobile Dealers' Association, will represent the motor car dealers; John H. Johnson will represent the N. A. A. D.; Josiah S. Hathaway will represent the Boston Commercial Vehicle Dealers' Association; George H. Hudson will speak for the electric vehicle men; James T. Sullivan will appear for the Bay State A. A.; Secretary James Fortesque will voice the sentiment of the Massachusetts State A. A., and it is expected that representatives of other organizations throughout the State will attend.

It is the intention of the committee to have several hearings if necessary so that everyone will have a chance to be heard. Later on the committee may sit at Springfield and Pittsfield to give men in the other part of the State a chance to be heard who cannot come to Boston.

### One Death at Aviation Fields

WASHINGTON, Nov. 2—There was but one death due to training flyers reported from American flying fields during the week ending Oct. 26. This fatality occurred at Park Field, Millington, Tenn. There were no deaths due to aviation accidents reported from any of the other 26 flying fields in the United States. The total flying time at aviation fields in this country during the week ending Oct. 26 was 14,779 hours in the air. The distance covered by all flyers at the 27 fields was 1,182,320 miles, a distance over 47 times around the earth.

## September Exports Satisfactory

Over 11% Better Than Those of August and Slightly in Excess of September, 1917

	1918		1917	
	Cars	Value	Trucks	Value
Sept.	3,305	\$2,593,236	1,280	\$3,215,206
Aug.	2,710	2,818,259	909	2,337,904

	1918		1917	
	Cars	Value	Trucks	Value
Sept.	4,038	\$3,432,290	1,314	\$3,903,067
Aug.	3,432	2,907,051	1,802	2,051,051

WASHINGTON, Nov. 6—Although during the month of September, 1918, we exported a greater number of passenger cars than during the previous month, the value was appreciably less, but this falling off in value was more than compensated for by the considerable increase in both the number and value of trucks exported. Automotive parts also showed a gain during September, with the result that the month's totals representing the value of trucks, cars and parts showed an increase of 11.2 per cent over the corresponding items for August. In comparison with September, 1917, a slight increase in value is shown, the gain in parts alone being more than sufficient to compensate for the drop in cars and trucks.

Taking the nine months ending September the present year shows a falling off in values of cars, trucks and parts of \$10,961,715 when compared with a similar period of 1917, the sole item showing an increase being that of parts.

During this period the various types of engines exported show a very substantial gain, this being especially evident in the case of tractor engines which are used in military service.

The United Kingdom and France continue to absorb the great majority of the trucks exported, but there are indications of increasing demand for commercial vehicles from the Latin American republics, many of which are included under the head of "other countries."

### Bituminous Production Drops

WASHINGTON, Nov. 5—Bituminous coal production for the week ended October 26 was 11,215,000 tons, a decrease of 309,000 tons over the preceding week, due, according to the Fuel Administration, to the influenza epidemic. This production, however, is an increase of 411,000 tons over the corresponding week of 1917. Anthracite production for the week ended October 25 was 1,714,000 tons, a decrease of 339,000 as compared with the corresponding week of 1917. In the week ended October 19 the total loss by all causes from 100 per cent production was 20.6 per cent, of which car shortage comprised 7.6 per cent, labor shortage 8.5 per cent, mine disability 3 per cent and all other causes 1.5 per cent.

### Inland Piston Ring in Larger Premises

ST. LOUIS, Nov. 4—The Inland Machine Co., makers of the Inland one-piece piston ring, has made its third move in two years to larger and better quarters. It is now in the Advertising Building at 17th and Locust Streets, having the first floor and basement.

## Implement Dealers to Convene

Expect 1200 at Combined Three-Day Meeting and Exhibition in Omaha, Nov. 13-15

OMAHA, Nov. 6—All display space is already sold out for the tenth annual convention of the Midwest Retail Implement Dealers' Association, which meets here Nov. 13, 14 and 15. Twelve hundred dealers are expected to attend the three-days session. Headquarters of the convention are at the Hotel Rome, with displays occupying the entire space at the Auditorium. The main floor of the Auditorium will be taken up by exhibits of farm implements and equipment, while tractors will be shown in the basement. Trucks and farm lighting systems will also comprise an important part of the displays.

### The Program

The program will comprise regular morning and afternoon sessions, at which men prominent in the implement truck and tractor trade from a wide section of the country will be speakers. Questions arising from advancing cost and restrictions of material and curtailment of output by war demands on manufacturing resources will feature the business sessions. Among the speakers will be Floyd R. Todd of Moline, Ill., vice-president of the John Deere Plow Co., who will represent the National Implement and Vehicle Dealers' Association

## Exports of Automotive Equipment for September and Eight Previous Months

	Month of September				Nine Months Ending September, 1918			
	1918		1917		1918		1917	
	No.	Value	No.	Value	No.	Value	No.	Value
Airplanes	13	\$197,700	1	\$4,000	28	\$417,455	138	\$1,065,707

Totals	32,048	\$29,616,551	7,967	\$19,258,345

at the convention. Mr. Todd will speak on November 15 on the implement industry. Following are the exhibitors:

B. F. Avery & Sons Co., Omaha, Avery tractors and implements.  
Janesville Machine Co., Omaha, tractor plow and implements.  
Western Motor Car Co., Omaha, Diamond-T and Columbia trucks.  
Nebraska Moline Plow Co., Omaha, Universal tractors and equipment.  
J. I. Case Plow Works, Omaha, J. I. C. tractors.  
Nebraska Bull tractor Co., Omaha, Neb., Bull tractors.  
Turner Manufacturing Co., Omaha, Turner Simplicity tractors.  
Mid-West Truck & Tractor Co., Omaha, Turner tractors, Simplicity engines, Traffic, Wolverine and Onelda trucks.  
Noyes-Killely Motor Co., Omaha, Wisconsin tractors.  
J. I. Case Threshing Machine Co., Omaha, gas and oil tractors.  
Hart Parr Co., Charles City, Ia., Hart Parr 15-30 kerosene tractors.  
Jones-Opper Co., Omaha, Cleveland crawler tractors.  
Hanson-Tyler Auto Co., Omaha, Allis Chalmers tractors.  
International Harvester Co., Omaha, International tractors, implements.  
Globe Manufacturing Co., Terry, Ia., hand engines, electric washers.  
Sunderland Machinery & Supply Co., Omaha, feed grinders, tank heaters.  
John Deere Plow Co., Omaha, implements and vehicles.  
Parlin & Orendorff Plow Co., Omaha, tractor drawn implements.  
Associated Mfg. Co., Omaha, engines and separators.  
Henry & Robinson Hdw. Co., Omaha, implement supplies.  
Stover Mfg. & Engine Co., Omaha, engines and graders.  
R. H. Boomer Mfg. Co., Council Bluffs, Ia., implements.  
Oliver Chilled Plow Works, Omaha, tractor tools.  
Cushman Motor Works, Lincoln, Neb., motors and unit light plants.  
John Dav Rubber Co., Omaha, tank heaters and belting.  
Hayes Pump & Planter Co., Omaha, pumps and implements.  
Emerson-Brantingham Co., Omaha, implements.  
Philip Barnard Co., Sioux City, Ia., tanks.  
Avery Co., Omaha, Avery tractor plow.  
New Idea Sreadder Co., Omaha, implements.  
Joel Turney Co., Fairfield, Ia., wagons and farm trucks.  
Electric Wheel Co., Quincy, Ill., farm trucks and wagon boxes.  
Advance Rumely Co., Lincoln, Neb., Huber tractor.  
J. D. Tower & Sons Co., Mondota, Ill., corn cultivators.

#### Importation of Pig Tin

WASHINGTON, Nov. 2—Hereafter licenses for the importation of pig tin will be authorized by the War Trade Board where the applications, otherwise in order, cover shipments purchased prior to Oct. 1, 1918. The date of purchase of such shipments will be determined by the American Iron and Steel Institute. Licenses will be issued for importation of pig tin when the applications, otherwise in order, were to the United States Steel Products Co., regardless of the date of purchase. Licenses will not be issued for the importation of pig tin under any circumstances excepting those outlined above. Selling prices on the tin recently purchased by the Inter-Allied Tin Executive at London and allocated to the United States will be announced some time between now and Dec. 31, 1918. Consumers, jobbers and dealers requiring spot tin will be assisted in locating stocks if they will communicate with the Sub-Committee on Pig Tin, American Iron and Steel Institute, Room 1811, 71 Broadway, New York City.

## September Exports from New York

### Another Big Increase in Truck Figures—Parts Exports Also Satisfactory

NEW YORK, Nov. 4—A fully maintained gain in both the number and value of trucks exported from the port of New York is the principal feature of the figures for the month of September. August truck exports showed a gain of 95 per cent over July, and the increase in September is a fraction over 94 per cent as regards number and almost 70 per cent in value.

Passenger cars show a falling off of approximately 30 per cent in number and 28 per cent in value, as against the previous month's totals, but under existing manufacturing conditions this drop is not unexpected.

#### Parts Exports Increase 30 Per Cent

Exports of parts show an increase in value of over 30 per cent in comparison with the total of August exports, and as the August figures available at this time are not quite complete the actual improvement is undoubtedly appreciably greater.

Chile is our largest buyer of passenger cars, with 280 for the month, and England and France have taken between them 723 of the 862 trucks exported. These two countries also lead as pur-

chasers of automotive parts and Chile's share of the total is also big. Siam rejoins our list of customers after an absence of some time.

#### Government Needs Laborers

WASHINGTON, Nov. 4—More than 370,000 common laborers are required immediately for work in ordnance plants, Navy yards and docks and for cantonments and other army construction work, and this amount, it is said by the Department of Labor, will have to be taken from "non-essential" industries. The ordnance makers need 139,000 workers, the Construction Division 200,000, and the Bureau of Yards and Docks of the Navy Department 31,000.

Serious disorganization of labor supplying the machinery of the United States Employment Service is threatened, according to the Department of Labor, by the practice of some employers in asking for larger numbers of workers than they need or can use and the Department of Labor is requesting various employers to be more reasonable in their demands.

There is an instance of factories requisitioning 1500 unskilled men who upon arrival at the plant found no place to sleep and no place where they could be fed and as a result more than 50 per cent deserted as quickly as they could. Another instance is that of an employer asking for 100 skilled workers when less than 50 would have been sufficient. Many other examples are quoted by the Department of Labor.

## Canadian Ford Is Prosperous

A Surplus of \$4,856,049 Is Shown for the Year—Fewer Cars Were Built

FORD CITY, ONT., Nov. 4—Although the Ford Motor Co. of Canada, Ltd., built only 46,914 cars during the fiscal year ended July 31 (3913 less than in 1917), the company's gross business totaled \$24,608,442. This is an increase of approximately \$800,000 over the total for the preceding year, and is due principally to an advance in price of passenger cars put in effect during the year.

The corporation's net profits for the year were \$2,358,192.94, an increase over last year of \$35,545. Its business profits tax for 1918 was \$167,951.

The balance sheet which is given herewith shows a surplus of \$4,856,049.03, or nearly \$2,500,000 more than last year. Total resources amounted to \$14,281,808.62, an increase of \$1,771,677 over the previous year. A 5 per cent cash dividend, distributed Oct. 14, 1917, and amounting to \$350,000, was the only disbursement to the stockholders during the fiscal year. There was no dividend payment the previous year. It was intimated another dividend might be declared in the near future.

Among the current assets, cash amounted to \$580,975.53, contrasting with \$2,066,456 last year. The reduction is largely accounted for by an increase in inventories, the aggregate of which, \$6,978,010.16, compares with \$3,859,214 a year ago, part of the increase in inventory also being attributable to the higher costs of materials. Of the total, the inventories for the home office totalled \$6,351,671.80, and is chiefly made up of manufactured parts of cars and trucks.

No change in capital stock was made during the year, the amount issued remaining at \$7,000,000 of the \$10,000,000 authorized.

The directors were re-elected as follows: Henry Ford, James Couzens, Gordon M. McGregor, Frank L. Klingensmith and W. R. Campbell.

### Weather Forecasts For Motor Routes

WASHINGTON, Nov. 4—The Weather Bureau of the U. S. Department of Agriculture has arranged, in co-operation with the State Highway Commission of Pennsylvania, to aid motor truck traffic during the coming winter over the Lincoln Highway between Pittsburgh and Harrisburg by giving out daily information of the weather conditions prevailing over the route and issuing weather forecasts and warnings of heavy snows and cold waves for the region traversed.

The plan is for assistant superintendents of highways at points along the route to report to the Weather Bureau office at Pittsburgh at 8 a. m. by telephone or telegraph the depth of snow or ice on the highway, giving its general condition. These reports are published

in the newspapers and furnished to the different automobile clubs, thus becoming available to automobile and motor-truck drivers passing over the highway. The forecasts and warnings are given public distribution and telegraphed to the superintendent of highways at Harrisburg, who gives instructions to his forces along the highway to make provisions for the anticipated weather conditions. This service was in operation last winter and gave great satisfaction. The Weather Bureau is ready to give similar service to other traffic routes as may be desired.

### Completing Military Highway Work

WASHINGTON, Nov. 4—Nine miles of concrete road between Alexandria, Va., and Camp Humphreys, Va., soon will be ready for use, marking the completion of planning and supervisory work done by engineers if the Bureau of Public Roads of the U. S. Department of Agriculture for the military authorities. The road from Alexandria to Camp Humphreys is the longest military highway outside of cantonments that has been planned and supervised by engineers of the bureau, although the total construction planned and supervised by these engineers aggregates several hundred miles and covers practically all the recognized types of construction, from sand and clay to first-class surfaces and concrete roads. Seventeen highway engineers and one superintendent of construction were detailed to military work by the bureau in July, 1917, the period of their assignments varying from 3 to 15 months.

## New Canadian Rule on Car Imports

Restrictions Modified to Permit Entry of Bodies and Parts Not Obtainable in Canada

OTTAWA, ONT., Nov. 1—The War Trade Board announces a new ruling in regard to import licenses for automobile bodies and chassis. It will be remembered that by order-in-council of June 3 the importation of automobiles valued at \$1,200 and upward at place of manufacture was prohibited except under license by the board. A memorandum of the department issued Sept. 17 declared that this prohibition also applied to the body and chassis of automobiles when the body or chassis together with the usual parts required to complete the automobile, amounted in value to \$1,200 or upwards, f.o.b. at place of export.

Regarding these restrictions on the importation of automobiles bodies and chassis, the War Trade Board has decided that where an automobile is for use on a chassis imported into Canada prior to June 16, 1918, upon proper evidence being submitted of the facts license for importation will be recommended. Furthermore the board will be disposed to recommend import license for bodies or other parts of cars not obtainable in Canada which are an essential requirement for the production of automobiles by bona fide manufacturers of automobiles in Canada.

### Moon Director in Charge of Motor Transport Repair Yard

ST. LOUIS, Nov. 4—Earl J. Moon, a director and one of the founders of the Moon Motor Co. of this city, has been ordered from Fort Sam Houston, Tex., to France, where he will be placed in charge of one of the repair yards of the Motor Transport Corps. Moon was commissioned a lieutenant in the Motor Transport Corps Oct. 18.

A. W. Crossman has been appointed district representative of The Cleveland Tractor Co., with headquarters at 604 Brockman Building, Los Angeles. His territory comprises California, Washington, Oregon, Arizona, Utah, Nevada and Idaho.

Charles Brownell, advertising manager of the Ford Motor Co., was elected vice-president of the Better Business Bureau of Detroit at a meeting of the executive committee. Plans were made for increasing the scope of the work.

E. H. Geyer, for a number of years associated with the Byrne-Kingston Co. and the Kokomo Electric Co., both of Kokomo, Ind., has been appointed general sales manager of the Hercules Motor & Mfg. Co., Canton, Ohio.

J. Edward Demar has resigned as sales manager of Chas. E. Reiss & Co., Inc., New York, to accept the presidency of the Carlisle Sales Co., Inc., distributor of the Carlisle cord tire, with offices and showrooms at 237 West Fifty-eighth Street.

### Packard Builds 900 Liberties in October

DETROIT, Nov. 4—During October the Packard Motor Car Co. completed 900 Liberty engines, or thirty-three in every working day. The company exceeded by 10 per cent the quota of 825 set for it by the Aircraft Production Board. The daily production during the month fluctuated, governed largely by the supplies of raw materials. On two days, the high score of fifty was made, and three days, forty. Most of the time, however, the engine assemblies stood at approximately thirty-five per day.

### Texas Has 271,854 Vehicles

AUSTIN, Nov. 6—It is shown by the records of the State Highway Commission that there are 271,854 automobiles and motor trucks registered in Texas. It is estimated, however, that this registration is perhaps twenty thousand in excess of the total number of motor vehicles now in actual use in this State, that number having been probably junked since their registrations. It is estimated that there are about 250,000 automobiles and motor trucks now in use in Texas. No separate record is kept of automobiles and motor trucks. It is therefore not definitely known how many there are of each of these motor vehicles.

## Men of the Industry

### Changes in Personnel and Position

Harry W. Ford, former president of the Saxon Motor Car Corp., Detroit, is reported to have been given a commission with the Motor Transport Corps, to be located at Jacksonville, Fla., where he is at present.

E. M. Benedict, formerly of Toronto, and expert in shell manufacture, has been appointed general manager of the Jackson Munitions Corp., Jackson, Mich.

J. H. Gould, formerly of the J. H. Gould Co., Detroit, has been appointed chief engineer of the Buffalo Pressed Steel Co., Buffalo, N. Y.

### Tracy Influenza Victim

WASHINGTON, Oct. 30—Percy Tracy died here to-day a victim of influenza followed by pneumonia. Mr. Tracy, recently buyer of parts for the Army trucks under Christian Girl, who called him to Washington, had just lately accepted the position of trailer purchaser under Col. F. Glover in the Quartermaster Department. Prior to the war he was the buyer for 5 years for the Paige Detroit Motor Corp., and at one time acted in the same capacity for the Premier Motor Co.

### New Turner Tractor Distributor

PORT WASHINGTON, Wis., Nov. 6—The Turner Mfg. Co. has appointed the Owen Magneto Corp, Chicago, distributors for Northern Illinois and Northern Indiana and the western half of Michigan for the Simplicity Tractor.

### Navy Seaplane Aloft 9 Hours

WASHINGTON, Nov. 4—A navy seaplane equipped with a Liberty engine recently remained in the air for 9 hours, says a report received today from Admiral Sims. The seaplane carried a full military load, four men, regulation supply of gasoline, two bombs weighing nearly 500 lbs. and two machine guns. No additional gasoline tanks were carried.

### Sulphuric Acid Contract Plant

WASHINGTON, Nov. 5—A sulphuric acid contract plant will be located at Grand Rapids, Mich. The Construction Division of the Army has been ordered to erect and equip this plant at an estimated cost of \$1,500,000. The plant is to be situated upon a tract of land which is the property of the U. S. Government upon which a picric acid plant is now being erected. When in operation this plant will be of sufficient size to produce approximately 75,000 net tons per year.

### Capt. Gilson Promoted Major

RACINE, Nov. 4—Capt. James W. Gilson of Racine, Wis., formerly sales manager of the Mitchell-Lewis Motor Co., now the Mitchell Motors Co., and the Lewis Motor Car Co., Racine, has been promoted to major, according to word received from France. In 1916 he organized a battery of field artillery in Racine to go to the Mexican border, and a year later he formed a second unit in which he was placed in command as captain. Before his battery left Camp MacArthur, Tex., Capt. Gilson was assigned to the staff of Brig. Gen. Haan and went overseas with the now famous Thirty-second division. In France he was re-assigned to the staff of Brig. Gen. Irwin, 57th Field Artillery brigade, upon which he now is serving as a major. His command has been in the thick of the fighting north and northeast of Chateau-Thierry for more than 100 days.

O. G. Watson, secretary, Menominee Motor Truck Co., Menominee, Mich., has accepted a commission as a second lieutenant in the Motor Transport Corps and left Oct. 29 for Camp Holabird, Md., to enter active service. He has resigned as alderman of the First ward, Menominee.

Clifford F. Messinger, advertising manager, Chain Belt Co., Milwaukee, has been given indefinite leave of absence to accept a commission as a first lieutenant in the gas and flame division, Chemical Warfare Service, U. S. Army. He has departed for Camp Kendrick, Lakehurst, N. J.

T. J. Phillips, cost and production expert of the Kissel Motor Car Co., Hartford, Wis., during the last 2 years, has resigned to accept the position of controller of the Porto Rico Sugar Co.

### Crippled Men Need Cycles

WASHINGTON, Nov. 4—American manufacturers will be called upon to furnish scores of thousands of tricycles and motorcycles for men who have lost limbs in the war, Consul H. D. Van Sant, who is located at Dunfermline, Scotland, said recently in a report to the Department of Commerce. The consul said bicycles were becoming so scarce in Great Britain that wheels originally selling at \$25 or \$30 now bring from \$60 to \$70.

If the demand for bicycles and tricycles is to be met American manufacturers must get busy, Mr. Van Sant intimated. A little readjustment of munition making machinery would enable the manufacturers to devote their plants to the new needs, the consul said.

Mr. Van Sant estimates that veterans of the war in Great Britain alone will be able to use about a million wheels of all kinds. To supply the demand will require the employment of an army of men and women and will reabsorb into the industrial ranks many of the returning soldiers.

## Can Meet Transportation Emergency

WASHINGTON, Nov. 4—Pennsylvania can meet any motor transportation emergency that may arise within that State, according to a report filed to-day by the State Council of National Defense with the Council of National Defense.

When the Highways Transport Committee of the Council of National Defense recently undertook to organize subordinate committees in each State for a more thorough utilization of the nation's highway transport resources it obtained the most efficient, immediate co-operation in Pennsylvania.

It was unnecessary to create new machinery because the Pennsylvania Council of National Defense, in its Motors and Motor Trucks Department, already possessed a state-wide organization, which in large measure was carrying out the policies advocated by the highways transport committee.

The report presents a summary of Pennsylvania's motor activity. One of the first steps taken by David S. Ludlum, formerly State motors director and now chairman of the Pennsylvania Highways Transport Committee, was a service

registry of 25 per cent of the 300,000 passenger cars of the State, 10 per cent of the registered cars being held available for emergency at all times.

This service has been rendered in all counties for Liberty Loan drives, also in transportation of farm and munition workers and in some instances in moving military bodies. Particularly valuable service was given in transporting nurses, doctors, medical stores and in conveying stricken persons during the influenza epidemic. Trucks equipped as ambulances saved the day in many devastated districts.

## Calendar

### ENGINEERING

Nov. 14-15—New York, Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

### SHOWS

Nov. 11-16—Phoenix, Ariz. Tractor demonstration, State Fair.  
Nov. 11-16—Pittsburgh, Pa. Fall Automobile Show, Motor Square Garden. Automobile Association of Pittsburgh.  
Jan. 13-19—Des Moines, Ia. First Tractor Show. Des Moines Thresher & Tractor Club. H. J. Clark, Mgr.

## Limit Garage Construction

WASHINGTON, Nov. 4—Garages, gasoline stations, store buildings and 14 other types of structures were listed yesterday by the War Industries Board as types of non-war construction which can be best postponed until after the war. The list issued includes: Churches, schools, hotels, office buildings, bank buildings, public buildings, moving picture houses, theaters and other amusement places, apartment buildings, water-work improvements, sewerage systems, garages and gasoline stations, sidewalks and park improvements.

## More Cleveland Additions

CLEVELAND, Nov. 4—Although the number of permits issued at the city building department the past week was not long, it contained a few permits for new construction work of considerable size. The Willard Storage Battery Co. took out a permit for a \$50,000 warehouse at 280 East 131st Street. The Lang Body Co. was granted a permit for a \$25,000 one-story factory addition, 16 by 80, at 3100 West 106th Street.

# AUTOMOTIVE INDUSTRIES

## THE AUTOMOBILE

XXXIX

NEW YORK, THURSDAY, NOVEMBER 14, 1918—CHICAGO

No. 20

## 50% Increase in Production Permitted

War Industries Board Reduces Restriction on Car, Truck and  
Tractor Output One-Half—Truck Makers Released from  
Pledge to Sell Essential Industries and Can Now  
Get Steel for 100% Production

DEMOBILIZATION NOT TO BRING DEMORALIZATION OF LABOR

Demand for War Materials Likely to Continue for Some Time—  
Gradual Disbanding of Army Planned—Makers Calmly  
Prepare for Return to Peace Conditions

**V**ASHINGTON, Nov. 12.—Production restrictions imposed by the War Industries Board have been lifted by 50 per cent insofar as remainder of the year is concerned, and it is expected that with the beginning of the new year restrictions of every nature will be eliminated that normal peace-time industrial activities will resume in full.

Passenger car manufacturers can produce 75 per cent of their total production in the last 7 weeks of 1917 during the last 7 weeks of this year.

Motor truck manufacturers can produce 100 per cent of their production for November and December, 1917, during the last remaining weeks of this year.

Farm tractor manufacturers who produced 100 or more tractors in the year preceding Sept. 30, 1918, can turn out 75 per cent of their production in the year ending Sept. 30, 1919. Farm tractor makers

who produced 10 or more tractors in the year preceding Sept. 30, 1918, can produce not over 100 tractors in the year ending Sept. 30, 1919. Similarly tractor makers who made less than 10 tractors in the year preceding Sept. 30, 1918, can turn out 20 tractors in the year ending Sept. 30, 1919.

Motorcycle manufacturers whose production has been restricted to 75 per cent for the last 4 months of this year compared with that period of 1917 can produce 87½ per cent of the production of the last 7 weeks of 1917 during the remainder of 1918.

Automobile tire production, which was curtailed 50 per cent, can proceed during the remaining weeks of this year at 75 per cent of the output for the corresponding period.

All of those industries which had been curtailed, states the War Industries Board in its announcement, can decrease their curtailment as fixed for the last 4 months of this year by 50 per cent for

the remainder of 1918. This percentage gives the figures stated above as the production figures for the remainder of the year.

For example, passenger car manufacturers were restricted to a production for the last half of 1918 of 25 per cent of the full production of 1917. This meant a production during the last 6 months of 1918 to 50 per cent of the output of the similar period of 1917. Consequently by reducing this curtailment by 50 per cent for the remainder of this year in accordance with the announcement of the War Industries Board there is a production cut of 25 per cent instead of 50 per cent allowing manufacturers to produce on a 75 per cent basis until January 1, 1919.

*All rules, regulations and conservation measures devised by the conservation division of the War Industries Board will be continued in full.* This means that the plans for reducing the numbers of sizes of pneumatic tires, truck tires and farm plows and the elimination of the uses of certain materials in motorcycles will continue.

#### Trucks on 100% Basis

Although trucks are not specially mentioned, the Automotive Section of the War Industries Board announced officially to-day that makers can consider themselves on a 100 per cent basis.

The clauses in the announcement to the effect that wholesale and retail dealers are relieved from their pledges to sell to essential consumers only and that makers are no longer required to obtain pledges from distributors, are said by the Automotive Section of the Board, to place the truck industry on 100 per cent output. The pledges which were given by manufacturers to conform to the allotment provided by the Automotive Section have not been terminated but will be shortly.

These pledges, however, should not stand in the way of 100 per cent production of any maker, said the Automotive Section to-day, as the allotments granted, it was said, were up to and over the 100 per cent production of the 18 months preceding July 1, 1918.

#### Can Supply All Truck Demands

It was pointed out to the representative of AUTOMOTIVE INDUSTRIES that in fixing these allotments where makers had met with adverse conditions in 1917, the production of the first six months of 1918 was used as the basis, and where makers had started in business since July 1, 1918, their facilities for manufacture and the stock on hand of parts and materials were used as a basis.

This arrangement would assure a liberal allotment. According to the reports received on truck production and stock on hand by the Automotive Section, manufacturers will be able to meet all demands for trucks during the remainder of the year.

Such in brief is the latest ruling of the War Industries Board, given to the industrial world immediately following the signing of the armistice with the Central Powers.

Not only is the production of cars, trucks, tractors

and motorcycles permitted to increase by 50 per cent over the previously allowed output, but all restrictions covering the sale of trucks to what have been termed essential industries also are removed, thus permitting makers to sell to capacity to every trade.

The removal of this restriction automatically removes the restriction placed upon steel makers who heretofore have been compelled to furnish steel only for essential uses but who now can sell truck makers all the steel they require.

#### Priority Assistance Assured

Furthermore, the Priorities Division also announces that it will assist all industries insofar as it is possible by means of priorities to secure the materials that will make for normal business, but priorities will be particularly given for the supply of the army and for the production of food, gas, oil, clothing, minerals and for aiding public utilities.

At the same time comes word that all official objection to shows has been withdrawn.

The National Automobile Chamber of Commerce is at present considering the matter of holding the National expositions in New York and Chicago and the sentiment is that if the various manufacturers can prepare sufficient models for them they will be held.

Manager Sam Miles states that it is necessary to take a mail vote of members and that if they are favorable to shows, as they were before the ban was placed on them, they will be held.

In this event, and in view of present conditions it is probable that the Chicago show would be held first, in the Coliseum as usual, with the New York show later and likely in Madison Square Garden.

#### May Continue Shows

Consideration is being given the possibility of holding dealer shows as well. The National Association of Show Managers, representing local exhibitions all over the country, has called an early meeting to be held in Cleveland, at which the question will be threshed out.

The War Industries Board has also removed all restrictions as regards the construction of Federal, State or Municipal highways, roads, bridges, etc., and for the development of mines including oil and gas wells. The order decreasing the amount of curtailment also applies to all agricultural implements, road making machinery, oil and gas consuming devices and all other commodities which have been restricted in output.

Non-war building construction is now allowed to a certain extent and any structures or additions or repairs not costing over \$10,000 can be made without permits while those not costing over \$25,000 can be made if a permit is secured from the State Council of Defense. Any building begun prior to September 3, 1918, and which has substantially developed can be completed without permit.

Dealers in raw materials and semi-finished and finished products are released completely from all of the pledges they have made to the Priorities

Division as regards the sale and distribution of the commodities they handle.

The Revenue Bill which is still in the hands of the Senate Finance Committee, it is now expected in view of the armistice will probably be reduced importantly in part. Nothing definite has been announced as yet, however, as regards the reduction of the contemplated taxes on automobiles, trucks, motorcycles and gasoline.

Thus, the first question of the industrial world as to what resumption of normal industry will be

allowed has been answered promptly by the War Industries Board.

The Fuel Administration up to this time has announced no relaxation from the restrictions it imposed on non-war industries and in fact has stated that no immediate reduction of the Government program for production or conservation of coal or oil during the winter will follow the signing of the armistice terms. Cessation of hostilities will unquestionably relieve the demand for bituminous coal, however.

## Complete Text of War Industries Board Ruling

All of the rules, regulations, restrictions and directions embodied in orders and circulars issued by the Priorities Division of the War Industries Board are continued in effect subject to the following modifications:

### SECTION 1.

Section 5 of revised Circular 21, issued by this division as of date Oct. 15, 1918, dealing with non-war construction is hereby amended so as hereafter to read as follows:

Section 5—Construction projects not requiring permits or licenses from non-war construction section. Construction projects falling within the following classifications are hereby approved, and no permits or licenses will be required therefrom from the non-war construction section.

1—Construction projects approved in writing by the Facilities Division of the War Industries Board.

2—All farm and ranch buildings, structures or improvements.

3—All buildings, structures, roadways, plant facilities or other construction projects of every nature whatsoever, undertaken by the United States Railroad Administration, or by any rail or water transportation company, organization or utility (whether or not under the direction of such administration) or by the American Railway Express Company, or by the owner or operator of any telegraph or telephone line.

4—The construction, maintenance, improvement or development by Federal, State or municipal authorities of highways, roads, boulevards, bridges, streets, parks and playgrounds.

5—The construction, extension, improvement, maintenance or repair of any public utility, including water supply systems, sewer systems, light and power facilities and street and interurban railways.

6—The construction, extension or repair of all irrigation and drainage projects.

7—Construction projects connected with the extension, expansion or development of mines of every character whatsoever or connected with the production and refining of mineral oils and of natural gas.

8—The construction, alteration or extension, or repairs or additions to plants engaged principally in producing, milling, refining, preserving, refrigerating or storing foods and feeds.

9—The construction of new or the alteration or extension of existing schoolhouses, churches, hospitals and Federal, State or municipal buildings involving in the aggregate a cost not exceeding \$25,000.

10—The construction of new buildings or structures not embraced in any of the foregoing classifications, or the repairs or additions to, or alterations or extensions of, existing buildings or structures, in either case involving in the aggregate a cost not exceeding \$10,000.

11—The construction of new buildings or structures not embraced in any of the foregoing classifications, or the repairs or additions to, or alterations or extensions of, existing buildings or structures, in either case involving in the aggregate a cost not exceeding \$25,000; when approved in writing by the State Council of Defense or its duly authorized representatives.

12—Buildings begun prior to Sept. 3, 1918, where a substantial portion of the building has already been constructed.

### Building Material Production

### SECTION 2

All limitations on the production of building materials, including brick, cement, lime, hollow tile and lumber, are hereby removed, and the materials so produced may be sold and de-

livered for use in connection with any building project for which no permit or license is required under Revised Priority Circular 21, as further revised by Section 1 hereof, or to any project authorized by permits or licenses issued in pursuance of said circular. All limitations upon the production or use of lime or crushed or pulverized limestone in any form for agricultural uses are hereby removed.

### SECTION 3

Restrictions upon industries and manufacturers in their production, or in their consumption of materials for commodities hereafter in this section enumerated, as such restrictions are expressed in orders and circulars issued by this division, are hereby so modified that such restrictions for the respective periods provided for in such several orders and circulars shall be less than the restrictions to the extent of 50 per cent of such restrictions. The commodities referred to are as follows:

1—Agricultural implements and farm operating equipment, including tractors.

2—Road machinery.

3—Coal, coke and wood-burning cooking and heating stoves and ranges.

4—Gas ranges, water heaters, room heaters, hot plates and appliances.

5—Oil and gasoline heating and cooking devices.

6—Electrical heating and cooking devices and appliances.

7—Black galvanized and enameled ware and tin plate household utensils.

8—Refrigerators.

9—Ice cream freezers.

10—Washing machines.

11—Clothes wringers.

12—Family sewing machines.

13—Electric vacuum cleaners.

14—Metal beds, cots, couches, bunks and metal springs for same.

15—Boilers and radiators.

16—Baby carriages.

17—Corsets.

18—Bicycles.

19—Electric fans (including motors).

20—Builders' hardware.

21—Padlocks.

22—Stepladders.

23—Scales and balances.

24—Rat and animal traps.

25—Talking machines (including motors and accessories).

26—Talking machine needles.

27—Clock-watches and clocks.

28—Watch movements and watch cases.

29—Hand stamping and marking devices.

30—Safes and vaults.

31—Lawn mowers.

32—Pottery.

33—Pocket knives and similar products.

34—Linoleum.

35—Rag felt floor covering.

36—Sporting goods.

37—Glass bottles and glass jars.

38—Tin plate.

39—Pianos, including piano players, automatic pianos and parts.

40—Pneumatic automobile tires.

41—Passenger automobiles.

42—Cash registers.

Nothing herein contained shall be construed to release any industry or manufacturer from the strict observance of the rules and regulations of the Conservation Division of the War Industries Board as applicable to such industry or manufacturer.

## SECTION 4

Dealers (wholesale and retail) in raw materials, semi-finished and finished products are hereby relieved from the obligation to give and require pledges relating to such commodities, notwithstanding any provision for pledges in any order or circular heretofore issued by the Priorities Division, and notwithstanding any stipulation in any pledge that they will require pledges from those who buy from them for resale; provided, however, building materials and other products shall not be sold and delivered for use in connection with any non-war construction projects save those for which no permit or license is required under priority circular No. 2, as revised by Section 1 hereof, or with the terms of orders and circulars heretofore issued, and comply with all pledges heretofore or hereafter given, save that they are hereby relieved from the provisions in such pledges as require manufacturers to exact pledges from those who buy them for resale.

## SECTION 5

The Priorities Division of the War Industries Board will, as far as practicable, assist industries in procuring materials, fuel, transportation and labor to enable them to increase their operations to normal limits as rapidly as conditions may warrant. Precedence must, however, be given to stimulate and increase the production of cargo ships and supply the requirements of the Army and Navy of the United States, as well as to provide for this nation's proper proportion of the enormous volume of materials, equipment and supplies as have been required for the reconstruction and rehabilitation of the devastated territories of Europe. Precedence must also be given to such activities as will tend to stimulate the production of foods and feeds, of coal, of natural gas, of oil and its products, of textiles and clothing, and of minerals; and to provide for deferred maintenance, additions, betterments, and extensions of railroads, telegraph and telephone lines and other public utilities, and to permit and stimulate the intensive development of inland waterways.

The War Industries Board has advised manufacturers of woolen sweaters and similar articles that the tentative schedule issued by the Conservation Division for the restrictions of the variety of their products would not be put into effect.

# War Work Contracts Not to Be Cut Short

## Pershing's Requirements Likely to Be Heavy for Months—Contracts for Future Production First to Go

By Allen Sinsheimer

**W**HAT will the United States do with unfinished war contracts? The armistice found the War Department totally unprepared for peace, and cablegrams are passing between here and the American Expeditionary Forces constantly this week to determine which war activities must be continued for the present, which can be gradually curtailed and which can cease at once. Conferences are also being held, and it is expected that definite news on this subject will be made public shortly.

Ninety per cent of the war contracts contained cancellation and termination clauses allowing for "termination in the public interest" by which payments will be made by the Government in the event of termination of the contracts for articles completely manufactured at the time and for raw materials, articles in process of manufacture and the contractor's outstanding obligations incurred in good faith in connection with the performance of the contract.

Provision is also made for payment by the Government on account of depreciation of plants and equipment. In return the Government is released from the obligation to take the remaining articles, not manufactured, specified in the contract and to pay anticipated profits to the contractor on the unfinished portions of the contract.

It is expected that all of these contracts which should be terminated in the public interest will be, and that the manufacturers will be satisfied with the decisions of the Board of Contract Adjustment which settles the amounts due the contractors.

In those contracts without cancellation or termination clauses and which the Government may desire to turn back, it is expected that the contractors will also be satisfied with a settlement made on the basis of the provisions contained in those contracts which have termination clauses as stated above.

For a precedent in this matter the Government has the practice which followed the Civil War. At that time the contracts had no cancellation clauses but all were cancelled and contractors were forced to the Court of Claims, at which they met with little success. They have this

same option to-day if they are dissatisfied with the findings of the Board of Contract Adjustment or the Secretary of War, to whom those findings can be appealed.

The delay in curtailment of war activities is caused by the ignorance of the authorities in this country of the desires of General Pershing. The Motor Vehicle Section of the Quartermaster Department anticipates, however, that it will completely cancel the last order for 25,000 B trucks which was placed recently and will take all of the preceding order for 8000 of these trucks, which is now about 50 per cent completed. It is expected that the orders for the A and the AA trucks which were recently started on by the manufacturers will be reduced from 40 to 60 per cent, depending on the needs of the Motor Transport Corps of the A. E. F. The contracts placed with the Packard company for 4000 Military tractors will be recalled. Similarly, the Ordnance Department engaged in tractor production and the Bureau of Aircraft Production which controls the output of airplanes are taking steps to reduce production, but neither of these departments have yet reached definite decisions.

The War Industries Board and the Fuel Administration are both temporary departments created for the duration of the war, and they retain authority until peace is formally proclaimed. •

At present a committee appointed by President Wilson is investigating conditions to ascertain whether these departments should be continued by congressional legislation following the declaration of peace, or whether they should be merged with the respective established Government bureaus, the Fuel Administration, for example, merging with the Department of the Interior, or if a reconstruction committee should be formed to take over the work of these departments or if possibly the Council of National Defense which is a permanent department can assume the more important functions which they give up with the relinquishment of their authority.

The War Trade Board, which is also a temporary department and which may delegate its work to the Department of Commerce, announces that for the present the control exercised over imports and exports will con-

tinue indefinitely to assure shipping space for the constant flow of supplies for the American and Allied forces which will be required for many months to come and to prevent the flooding of the United States with foreign orders which would strip this country of its immediate available commodities and which would come with any lifting of the present embargoes.

In view of the permanency of the Council of National Defense, which department was created prior to the war and, by the bill creating it, can continue after, it is expected that the Highways Transport Committee which is a part of the Council will be continued and will operate on a broader scope than heretofore, working particularly with the Food Administration and the United States Shipping Board, developing roads to facilitate food production and distribution and its delivery to the ships for overseas consumption.

#### Work for All

The Motor Transport Corps also recently organized in the army is expected to continue with increasing importance for the time being, as the overseas forces will operate their motor vehicles widely as heretofore and the M. T. C. controlling operations and maintenance will continue this work. The Motor Vehicle Section of the Quartermaster Department, purchasing motor vehicles, will likely discontinue or be reduced importantly as soon as the production and procurement of the remaining vehicles necessary for the army is completed.

Plans for control of labor following demobilization include a scheme for "demobilization for peace as we mobilized for war." This means that the men to be first re-

leased from the army will be those who are the heads of families or who are skilled workers necessary to peace time industries.

It is also planned to use the Department of Labor Community Boards to bring employers and workers in contact.

"It is clear that there is work enough," said Secretary of War Baker to-day, "in the United States for all the labor in the country. Many Government activities like the ship building industry will continue uninterruptedly and others will gradually be readjusted."

It was further stated that there should be no fear of keen competition and surplus of labor caused by the demobilization because these men will be distributed to their own localities and can thus be quickly assimilated by local industries.

Manufacturers who have been in Washington in the past few days state that they are trying to retain as much of their war work as possible until they can gradually change their equipment from a war to a peace basis and thus by the continuing operations hold their labor organizations together and be ready for large peace production when all conditions allow it.

The work of reclaiming the vast amounts of materials and supplies in plants will be carried out by the War Department in co-operation with the War Industries Board. A considerable part of the material, including particularly motor vehicles, will be disposed of abroad, while those remaining will be brought back to the United States. The Belgian Government is negotiating now for the purchase of American Army trucks and automobiles in France.

## No Labor Flood Expected with Demobilization

### Army to Be Released Not Faster Than Places Open for Men—Europe Will Have Enormous Labor Demand

THERE is no idea in industry that an overnight change will have to be made from war to peace work. Under the direction of a wise government which fully realizes the problems of labor and materials involved in shifting from one kind of manufacturing to another, it is confidently expected that changes will be so gradual that no chaos will result. Manufacturers will immediately start work to secure peace business. They will begin to build up their sales organizations, which have been depleted since war compelled an abandonment of peace production.

One of the fears which has been expressed frequently but which on careful analysis appears absolutely groundless, is that the country will be flooded with labor due to the demobilization of the army. There is a pent-up demand for labor in such fields as building and a great many others which have been temporarily classified as non-essential from a war standpoint.

This demand alone will absorb all of the army which can possibly be released during the coming nine or ten months. The Labor, War and Navy Departments and the War Industries Board are determined not to disband the army any more rapidly than employers find places for the men. The War Industries Board has sent questionnaires to employers in all industries asking the needs of each for men and in other ways is seeking to secure an accurate knowledge of labor demand.

It is very probable that the War Department will take advantage of the machinery used in the draft to assist in systematic demobilization. In fact, it has already been suggested that General Crowder be put in charge of the task of preserving the proper labor balance during demobilization operations. It must not be forgotten that a considerable army will have to be maintained in France or elsewhere in Europe pending final peace negotiations, and the great work of policing and reconstruction.

Andre Tardieu, General Commissioner for Franco-American war affairs, has already appealed to the United States for aid in rebuilding France. This is only a first suggestion of the fact that in spite of the vast armies which will be demobilized, the world will be short of manpower to undo the damage of the past four years. France alone has lost 2,500,000 men. In other words, 1/15 of her population is missing at the very time when all her resources are necessary for rebuilding, and these men who are lost represent the youngest and strongest of the nation.

The war expenditure of France, 120,000,000,000 Francs, is a heavy burden on the shoulders of this nation. Unhappily, the territories which have been invaded were the wealthiest of France, and although in area they did not exceed 6 per cent of the total country, they paid 25 per cent of the total taxes. There have been 350,000

homes destroyed, and it will require 600,000,000 days of work to rebuild them, without considering the inside furnishing.

Some knowledge of the need for farm tractors and other mechanical implements in France to take the place of what has been lost, may be gained from the fact that 454,000 machines and carts of an agricultural nature have been destroyed. The loss in horses and cattle amounts to over 1,500,000. These items have a valuation of approximately \$1,200,000,000.

The valuation of other industrial material from the invaded region as compared with the total resources of

France may be gained from the figures of 1913, when it amounted to 94 per cent of the total divided as follows: Flax for spinning, 90 per cent; iron ore, 90 per cent; pig iron, 83 per cent; steel, 70 per cent; sugar, 70 per cent; cotton, 60 per cent; coal, 55 per cent; electric power, 45 per cent. Of all this, the plants, machinery, mines and so forth have been totally destroyed.

To reconstruct over 2,000,000 tons of pig iron and nearly 4,000,000 tons of steel alone will be required. The raw material alone required to build up what has been destroyed will total \$10,000,000,000. France needs America's help in this.

## Makers Plan Return To Peace Basis

### Demand For War Materials Will Continue Some Time—Few Cancellations for Future Deliveries

**D**ETROIT, Nov. 12—Detroit automobile manufacturers are not greatly concerned over switching back from war production to peace-time outputs. While every company expects cancellations from Washington, the various officials do not believe these will come all at one time.

The consensus of opinion among the automobile men is that war-time production will go on unabated for a time and that when the allied governments see what turn things are going to take in Europe preparation will be made for the cutting out of war work. This will be tapered off in a manner that will permit the manufacturers to change over gradually to production of passenger and commercial vehicles.

#### Few Cancellations Received

Not a single company, as far as is known at this time, has received a cancellation from Washington, except on far distant future deliveries. An order was received and put into effect about 10 days ago cutting out all overtime work in the plants and building operations where plant extensions for war work were being made.

The manufacturers are a unit in the belief that no industrial depression will occur during the time the industry is getting back to normal. With the great demand for cars and trucks that is bound to come they figure their shops will be working full time and at top speed at an early date after peace is concluded.

#### Await Government Action

Future plans for the automobile industry will depend entirely on the action of the Government, according to C. D. Hastings, vice-president of the Hupp Motor Car Corp. Hupp production of war materials is going on as usual, the only changes ordered by the Government being elimination of overtime work and cessation of all building operations on plant extension.

"Whatever we hear now is only gossip," said Mr. Hastings, "for the officials in Washington, I do not believe, know just what will be done as yet. There have been a great many contracts cancelled, but in our opinion war work will be cut down gradually to allow for the change over to automobile manufacturing. With cancellation of war contracts spread over a fair period of time there should be no industrial depression.

"Our company could begin the manufacture of automobiles to-morrow, if permitted to do so. Going back to production of motor cars will depend entirely on what the Government allows us in the way of materials, and I do not think there will be much of a change before Janu-

ary 1. It is likely we will know shortly after the beginning of the New Year what is to be done."

The Ford Motor Co., which is perhaps doing more war work than any other automobile company, is going ahead with the production of war materials. F. L. Klingensmith, treasurer, said: "We are going right on with all our war business. Our production is just as great this week as last, and until the Government instructs us to cease manufacturing we will go on as usual."

#### Maxwell Continues Production

"There has been no stoppage in our production as yet," said Walter E. Flanders, of the Maxwell Motor Co., Inc. "We will have to do whatever the Government tells us, but as yet we have had no instructions. Cutting out war contracts now would force us to lay off all our factory employees. It is too early yet to tell what will happen."

No cancellations of war contracts have been received to date by the Paige-Detroit Motor Car Co., H. M. Jewett, president, announces. The Government cannot afford to cancel all contracts simultaneously, Mr. Jewett says, for the reason that chaos would result instantly.

"War production will be reduced gradually," Mr. Jewett asserted, "and in this way the industries will be kept busy and materials already on hand can be used up. Otherwise these materials would be a tremendous loss to the Government. All the trucks and tractors now in France and those in the process of manufacture will be needed in the reconstruction work in northern France and Belgium. This will leave a great demand for the same machines in this country, so that the various companies will go quickly into large production at the earliest possible moment.

#### Depend Upon Supplies

"We are building automobiles now and plan to gradually increase our output, according to the availability of steel and other supplies. I believe all the manufacturers doing war work will follow a similar plan and thereby get quickly back to peace-time production. The steel now going into war equipment will be sufficient to take care of car and truck production.

"An enormous building program has been held up on account of the war and this will have to be taken care of. It means the employment of thousands of men and the use of a large amount of material. We look for everything to run as smoothly as though there had never been a change in manufacturing."

# Extracts from Von Richthofen's Diary

Famous German "Ace" Was Credited with Having  
Shot Down Eighty-Two British and French  
Airplanes—He Commanded the Famous  
"Flying Circus"

## PART I

**EDITOR'S NOTE.**—Rittmeister Freiherr Manfred von Richthofen was considered the greatest pilot of the German army. He accounted for eighty-two enemy machines before meeting his death at the hands of a British airman in May, 1918.

On his body was found a personal letter from the German army commander of the Somme area urging him to lead his squadron for at least one reconnaissance despite the fact that British aerial superiority had become so evident that scouting was attended by almost insuperable difficulties. He was buried by his enemies with full military honors as a gallant fighter and a worthy antagonist.

### My First Solo-Flight

THERE are some moments in one's life which tickle one's nerves particularly, and the first solo-flight is among them. One evening my teacher, Zeumer, said: "Now go and fly by yourself." I must candidly confess that I felt like replying, "I am afraid," but this is the word which should never be used by a man who defends his country, therefore, whether I liked it or not, I had to swallow it and get into the machine. Zeumer explained to me once more every movement in theory.

I scarcely listened to his explanation, for I was firmly convinced that I should forget half he was telling me. I started the machine. The aeroplane went the prescribed speed, and I noticed when I had left the ground. After all, I did not feel timorous, but rather elated. Now I did not care for anything. I would not have been frightened whatever had happened. Scorning death, I made a large turn to the left, stopped the engine near a tree, exactly where I had been ordered to do so, and looked forward to what would happen. Now came the most difficult thing, the landing. I remembered exactly the movements I had to make. I acted mechanically and the machine moved quite differently from what I had expected. I lost my balance, made some wrong movements, turned a cartwheel on hitting the ground, and succeeded in converting my machine into a battered mess of wreckage. I was very sad, looked at the damage I had done to the machine, and had to suffer from other people's jokes.

### I Leave Russia for France

The August sun was almost unbearably hot on the sandy flying ground at Kovel. While we were chatting among ourselves one of my comrades said: "To-day the great Boelcke is coming on a visit to us, or rather to his brother!" In the evening the great man duly arrived. He was vastly admired by all, and he told us many interesting things about his journey to Turkey. He was just returning from Turkey, and was on the way to Headquarters. He imagined that he would go to the Somme to continue his work. He was to organize a fighting squadron. He was empowered to select from the Flying Service those men who seemed to him particularly qualified for his purpose.

I did not dare to ask him to be taken on. I did not feel bored by the fighting in Russia. On the contrary, we made extensive and interesting flights. We bombed the Russians at their stations. Still, the idea of fighting again on the Western Front attracted me. There is nothing finer for a young cavalry officer than the chase in the air.

The next morning Boelcke was to leave us. Quite early somebody knocked at my door, and before me stood the great man with the "Ordre pour le Mérite." I knew him, as I have previously mentioned, but still I had never imagined that he came to look me up in order to ask me

CAPTAIN BARON VON RICHTHOFEN

This Fokker triplane is supposed to be the machine which von Richthofen was using when brought down by a single bullet through the heart

*A German photograph showing the end of Immelmann, one of their star airmen. He had a long list of victories*

to become his pupil. I almost fell on his neck when he inquired whether I cared to go with him to the Somme.

Three days later I sat in the railway train and traveled through the whole of Germany straight away to the new field of my activity. At last my greatest wish was fulfilled. From now onward began the finest time of my life.

At that time I did not dare to hope that I should be as successful as I have been. When I left my quarters in the East a good friend of mine called out after me: "See that you do not come back without the 'Ordre pour le Mérite.'"

#### [Major Hawker

I was extremely proud when one fine day I was informed that the aviator whom I had brought down on the 23rd of November, 1916, was Major Hawker, the English Immelmann.

In view of the character of our fight, it was clear to me that I had been tackling a flying champion.

One day I was blithely flying to give chase when I noticed three Englishmen who also had apparently gone a-hunting. I noticed that they were interested in my direction, and as I felt much inclination to have a fight I did not want to disappoint them.

I was flying at a lower altitude. Consequently I had to wait until one of my English friends tried to drop on me. After a short while he came sailing along and wanted to tackle me in the rear. After firing five shots he had to stop, for I had swerved in a sharp curve.

The Englishman tried to catch me up in the rear while I tried to get behind him. So we circled round and round like madmen after one another at an altitude of about 10,000 feet.

First we circled twenty times to the left, and then thirty times to the right. Each tried to get behind and above the other.

Soon I discovered that I was not

meeting a beginner. He had not the slightest intention to break off the fight. He was traveling in a box which turned beautifully. However, my packing case was better at climbing than his. But I succeeded at last in getting above and beyond my English waltzing partner.

When we had got down to about 6000 feet without having achieved anything particular, my opponent ought to have discovered that it was time for him to take his leave. The wind was favorable to me, for it drove us more and more toward the German position. At last we were above Bapaume, about half a mile behind the German front. The gallant fellow was full of pluck, and when we had got down to about 3000 feet he merrily waved to me as if he would say, Well, how do you do?

The circles which we made around one another were so narrow that their diameter was probably no more than 250 or 300 feet. I had time to take a good look at my opponent. I looked down into his carriage and could see every movement of his head. If he had not had his cap on I would have noticed what kind of a face he was making.

My Englishman was a good sportsman, but by and by the thing became a little too hot for him. He had to decide whether he would land on German ground or whether he would fly back to the English lines. Of course he tried the latter, after having endeavored in vain to

*A German Albatross of the latest single-seater scouting type. This machine was brought down by a British airman*

escape me by loopings and such tricks. At that time his first bullets were flying around me, for so far neither of us had been able to do any shooting.

When he had come down to about 300 feet he tried to escape by flying in a zig-zag course, which makes it difficult for an observer on the ground to shoot. That was my most favorable moment. I followed him at an altitude of from 250 to 150 feet, firing all the time. The Englishman could not help falling. But the jamming of my gun nearly robbed me of my success.

My opponent fell, shot through the head, 150 feet behind our lines. His machine-gun was dug out of the ground and it ornaments the entrance of my dwelling.

### I Get the "Ordre Pour le Merite"

I had brought down my sixteenth victim, and I had come to the head of the list of all the flying chasers. I had obtained the aim which I had set myself. In the previous years I had said in fun to my friend Lyncke, when we were trained together, and when he asked me: "What is your object? What will you obtain by flying?" "I would like to be the first of the chasers. That must be very nice." That I should succeed in this I did not believe myself. Other people also did not expect my success. Boelcke is supposed to have said, not to me personally—I have only heard the report—when asked: "Which of the fellows is likely to become a good chaser?" "That is the man!" pointing his finger in my direction.

Boelcke and Immelmann were given the Ordre Pour le Mérite when they had brought down their eighth aeroplane. I had downed twice that number. The question was, What would happen to me? I was very curious. It was rumored that I was to be given command of a chasing squadron.

One fine day a telegram arrived which stated: "Lieutenant von Richthofen is appointed Commander of the Eleventh Chasing Squadron."

I must say I was annoyed. I had learned to work so well with my comrades of Boelcke's Squadron, and now I had to begin all over again working hand in hand with different people. It was a beastly nuisance. Besides, I should have preferred the Ordre Pour le Mérite.

Two days later, when we were sitting sociably together, we men of the Boelcke's Squadron, celebrating my departure, a telegram from Headquarters arrived. It stated that His Majesty had graciously condescended to give me the Ordre Pour le Mérite. Of course my joy was tremendous. It was balm on my wound.

I had never imagined that it would be so delightful to command a chasing squadron. Even in my dreams I

*Tail of one of the newest Friedbrichafner machines. The relative size can be gaged from the man who is holding it*

had not imagined that there would ever be a von Richthofen's squadron of aeroplanes.

### English and French Flying\* (February, 1917)

I was trying to compete with Boelcke's squadron. Every evening we compared our bags. However, Boelcke's pupils are smart rascals. I cannot get ahead of them. The utmost one can do is to draw level with them. The Boelcke stäffel has an advantage over my people of 100 aeroplanes downed. I must allow them to retain it. Everything depends on whether we have for opponents those French tricksters or those daring fellows the English. I prefer the English. Frequently the daring of the latter can only be described as stupidity. In their eyes it may be pluck and bravery.

The great thing in air fighting is that the decisive factor does not lie in trick flying, but solely in the personal ability and energy of the aviator. A flying man may be able to loop and do all the tricks imaginable, and yet he may not succeed in shooting down a single enemy.

\*This was evidently written when the French air service, although equipped with machines which were the best available at the time, were handicapped somewhat in comparison with that of the Germans. Conditions were very different later on, as has been evidenced by France's practical domination of the air.

*A German plane shot down behind the British lines. The panel seen in the fuselage is used by the gunner in the event of an attack from below*

*A machine of unknown type brought down by British fliers on the Italian front. It struck the ground with such violence that the undercarriage was torn off and the wings collapsed*

In my opinion the aggressive spirit is everything, and that spirit is very strong in us Germans. Hence we shall always retain the domination of the air.

The French have a different character. They like to set traps and to attack their opponents unawares. That cannot easily be done in the air. Only a beginner can be caught, and one cannot set traps, because an aeroplane cannot hide itself. The invisible aeroplane has not yet been discovered. Sometimes, however, the Gallic blood asserts itself. The Frenchmen will then attack. But the French attacking spirit is like bottled lemonade. It lacks tenacity.

In Englishmen, on the other hand, one notices that they are of Germanic blood. Sportsmen easily take to flying, but Englishmen see in flying nothing but a sport. They take a perfect delight in looping the loop, flying on their back, and indulging in other tricks for the benefit of our soldiers in the trenches. All these tricks may impress people who attend a sports meeting, but the public at the battle front is not as appreciative of these things. It demands higher qualifications than trick flying. Therefore, the blood of English pilots will have to flow in streams.

#### My Record Day

The weather was glorious. We were ready for starting. I had for visitor a gentleman who had never seen a fight in the air or anything resembling it, and he had just assured me that it would tremendously interest him to witness an aerial battle.

We climbed into our packing cases, and laughed much about him. Friend Schäfer thought that we might give him some fun. We placed him before a telescope and off we went.

The day began well. We had scarcely gone to an altitude of 6000 ft. when an English patrol of five machines was coming our way. We attacked them by a rush, as if we were cavalry, and the hostile squadron lay destroyed on the ground. None of our men were even wounded. Of our enemies three had plunged to the ground and two had come down in flames.

The good fellow down below was not a little surprised. He had imagined that the affair would look quite different, that it would be far more dramatic. He thought the whole encounter had looked quite harmless until suddenly some machines came falling down looking like rockets. I have gradually become accustomed to seeing machines falling down, but I must say it impressed me very deeply when I saw my first Englishman fall, and I have often seen the event again in my dreams.

As the day had begun so propitiously, we sat down and had a decent breakfast. Of course, all of us were as hungry as wolves. In the meantime our machines were again made ready for starting. Fresh cartridges were got and then we went off again.

In the evening we were able to send off the proud report: "Six German machines have destroyed thirteen hostile aeroplanes."

Boelcke's squadron had only once been able to make a similar report. At that time we had shot down eight machines. To-day one of us had brought low four of his opponents. The hero was a Lieutenant Wolff, a delicate-looking little fellow, in whom nobody could have suspected a redoubtable hero. My brother had destroyed two, Schäfer two, Festner two, and I three.

We went to bed in the evening tremendously proud, but also terribly tired. On the following day we read with noisy approval about our deeds of the previous day in the official communiqué. On the next day we downed eight hostile machines.

A very amusing thing occurred. One of the Englishmen whom we had shot down, and whom we had made a prisoner, was talking to us. Of course, he inquired after the red aeroplane. It is not unknown even among the troops in the trenches, and is called by them "le diable rouge." In the squadron to which he belonged there was a rumor that the red machine was occupied by a girl, by a kind of Jeanne d'Arc. He was intensely surprised when I assured him that the supposed girl was standing in front of him. He did not intend to make a joke. He was actually convinced that only a girl could sit in the extravagantly painted machine.

(To be concluded)

# Heider Friction Drive Tractor

Made in Two Sizes with Ratings of 9-16 and 12-20 Hp.—Engine Slides Back and Forth in Making Changes of Speed—Fiber-Faced Wheel Is Driving Member, Which Obviates Formation of Flat Spots

**T**HE outstanding feature of the Heider tractor, manufactured by the Rock Island Plow Co., Rock Island, Ill., is its friction drive, which enables a considerable number of tractor speeds and belt speeds to be obtained without the use of shifting gears. In the Heider the usual order of things in friction drives is reversed in that the fiber wheel is the driving member and the metal disks are the driven members, there being one disk for the forward speeds and one for the reverse. This arrangement overcomes the chief objection which has been made to the friction drive in the past, namely, that if the vehicle gets stalled and the drive slips it takes only a short time when a flat spot is worn on the friction wheel, and the drive is then very jerky in operation.

Another advantage of this arrangement of the drive is that when the tractor is pulling hard, and consequently the most power has to be transmitted, the fiber wheel engages the disk close to the outside rim, giving the best leverage and generally the best conditions of operation.

## Waukesha Engine Used

The Heider is made in two models, one having a 9-16 hp. rating and the other a 12-20. Both models are equipped with Waukesha engines. The 12-20, which is the model specially dealt with in this article, has a 4-cylinder engine of 4½ in. bore by 6¾ in. stroke. As the Waukesha engine is well known to our readers it is not necessary here to go into details of its construction. It has cylinders of the L-head type and is designed to burn either gasoline or kerosene. Lubrication of the engine is by the splash system. The engine is arranged longitudinally at the forward end of the frame and instead of being mounted rigidly on the frame is placed in guides so that it can be slid forward and back in order to obtain variations in gear reduction. The cooling system has a capacity of 9½ gal. A 22 in. fan is mounted back of the radiator at the forward end of the engine space and is driven by a 1½ in. flat belt.

The fuel problem has been handled somewhat differently on the Heider than it is usually handled. Considerable supplies of both gasoline and kerosene may be carried, and the operator can use whichever fuel he considers best suited under the particular working conditions. There are two cylindrical fuel tanks mounted longitudinally in the cab. Each tank has a capacity of 14 gal. One of the tanks is designed to hold only kerosene, while the other tank has two compartments, one for gasoline and the other for water, each compartment having a capacity of 7 gal. The water is fed to the engine when kerosene is used as fuel in order to prevent pre-ignition and knocking. The water feed can be controlled from the cab. Air is drawn in through a Bennett dust separator.

Beneath the carbureter, which is accessibly located, there are two large inspection plates in the crankcase, which can be readily removed when it is desired to get at the bearings. The lower half of the crankcase also can be readily removed, and this gives access to the main and connecting-rod bearings for inspection and adjustment. The pistons and connecting-rods can be taken out at the bottom without removing the crankshaft.

Ignition is by a Dixie magneto with starter coupling. As the engine is arranged to be slid lengthwise on the frame in making changes of speed, all of its accessories are carried on the engine so that they slide with it. This applies even to the spark, throttle and water control levers, which are mounted on a wooden bar extending back through an opening in the dashboard.

The friction wheel is integral with the flywheel of the engine and has a facing of fiber. The two driven friction disks are mounted on opposite sides of the flywheel close to the frame side members. These disks are 26 in. in diameter, while the wheel is of 20 in. diameter. When the tractor is at rest, the two friction disks are out of contact with the friction wheel. They are brought into contact with the rim of the wheel by axial displacement of the shaft on which the friction disks are mounted. Moving this shaft to the left brings the

The Heider 12-22 tractor with canopy top

A view in the operator's cab

Side view of friction drive and inclosed gears

right hand disk in contact with the wheel and gives forward motion, whereas moving the shaft to the right brings the left hand disk in contact with the wheel and gives the reverse speed. The pressure necessary for moving the shaft and placing wheel and disk in contact is transmitted to the shaft through a ball bearing thrust cage carried by the shaft. This shaft is carried in self-aligning ball bearings at both ends, these ball bearings taking the radial load only. From the shaft carrying the two friction disks the power is transmitted through a spur pinion and large spur gear to the differential shaft. This pair of spur gears is inclosed in a cast iron housing and operates in a bath of oil. The ends of the differential shaft carry the bull pinions that mesh with the bull gears on the driving wheels. The pinions are cut and hardened, while the large gear wheels are cast. By means of the friction drive a speed range of 1 to 4 m.p.h. is obtainable, in seven steps. The normal plowing speed is  $2\frac{1}{2}$  m.p.h.

The belt drive is also taken through the friction wheel and the right hand disk. When it is desired to do belt work the spur pinion on the friction disk shaft is slipped out of mesh with its gear. To this end it is provided with a grooved extension with which a shifting fork engages, and the pinion is shifted by means of a lever in the driver's cab.

#### Details of Heider

The frame of the Heider 12-20 is built up of 6-in. channels. The front axle is of the built-up type and has a coiled spring at the center through which the forward end of the frame is supported on it. The axle, of course, is steadied by means of radius rods extending to a cross member of the frame at about midlength. Steering is effected by means of a hand wheel in the cab which operates through a worm and worm wheel and a link and lever connection to the steering knuckles at the ends of the front axle. The front axle is swiveled on a ball joint at the center so that the running gear of the tractor can accommodate itself to uneven ground.

The frame is slung under the rear axle, giving a low-hung construction and unusual stability. This low construction is of particular importance in connection with orchard cultivation, for which work the canopy is removed.

The seat is mounted on a vertical post with a coiled cushioning spring on it. In the rear view of the tractor, showing the inside of the cab, will be seen a substantial horizontally movable lever extending through the dashboard, by means of which the driving pinion can be shifted in and out of mesh. To the right of the steering post is the lever by means of which

one or the other of the friction disks is forced in contact with the friction wheel and to the left of the steering post is another lever, for sliding the engine forward or back to vary the speed reduction, which moves on a quadrant with seven notches. There are no pedals, as the tractor has neither clutch nor brake, the reversing disk being used also for braking purposes. It is claimed that the machine can be thrown from high speed into reverse instantly without danger of injury.

#### Wheel Equipment

The wheels are ordinarily furnished with small pyramidal lugs and large cone lugs. For unusual soil conditions the company can furnish extension rims and also angle cleats, these being extras. However, the use of neither one nor the other of these is advised unless actually called for by the conditions, as both consume power.

The 12-20 model has a wheelbase of 96 in. The rear wheels are 57 in. in diameter and 10 in. wide, while the front wheels are 30 in. in diameter and 5 in. wide. The belt pulley is 14 in. in diameter and has a 7 in. face, and by means of the friction drive it is possible to obtain pulley speeds varying all the way from 100 to 800 r.p.m. The drawbar is so arranged that the hitch is 19 in. from the ground; it swings laterally and has a range of adjustment of 24 in. There is a sheet metal gear guard over the top half of each bull gear and a mud guard over the top half of each driving wheel. The sides of the cab join the mud guards. A corrugated sheet metal top over the seat is supported on four uprights. The weight of the Heider 12-20 tractor complete is 6000 lb.

AS in the case of the standard Brinell machine, there are limitations to all ball hardness testers. In those cases in which the metal is extremely hard a permanent deformation of the ball results. Where the test specimen is soft, the ball penetrates so closely to the supporting surface or anvil that the hardness of the latter affects the results. Small narrow specimens of hard steel crack under test and soft narrow ones permit of an easy lateral flow which affects the accuracy of the test. Fortunately, with the exception of thin pieces such as sheets, none of the above cases are so extremely common as to materially curtail the use of the Brinell machine.

Plan of friction and gear drive

# Paige-Detroit Brings Out 2-Ton Truck

assembled of Standard Parts and Will Sell for \$2,950—Body Designs to Be Extended on Completion of Government Contract

The Paige-Detroit Motor Car Co. now on the market with its new 2-ton truck. This truck has been under development for some time and is now assembled model mounted on a chassis of 150 in. The Paige company has been building, during the last few months, on Government order a number of trucks for overseas. The 2-ton model is the first effort of the concern to market commercial trucks of this capacity and marks the entrance into the commercial vehicle field of another of the big list of passenger car concerns which have previously confined their efforts to that field.

A limited number of the new Paige truck will be distributed. As soon as the company can meet its Government obligation it will increase its production of this model and will widen the scope of body design in order to take advantage of various fields of transportation.

The chassis sells for \$2,950. It is rated at 2 tons capacity. The frame is made up of pressed steel on a semi-truck design. The truck is mounted on tires 36 x 4 front and 36 x 7 rear. The wheels are wood with spokes.

The units composing the chassis are a product of well-known concerns in the parts field, the engine being a Continental, the gears Timken, the carburetor a Stromberg, the governor a Bosch, the ignition Bosch and the remaining list in keeping. The power plant is a unit type, the Continental engine being a 4-cylinder 4 1/4 x 5 1/4, with the cylinders cast together. The valves are on the right side. Water circulation is used for cooling, the pump being centrifugal type and the radiator a spiral finned tube. The timing is set spark and no starting or lighting system is provided. The carburetor is a Stromberg, 1 1/4 in. size, fed by a fuel tank.

The drive is delivered from the engine through a dry multiple disk clutch having twelve plates. The gearset is selective

Side view of Paige 2-ton truck chassis

Rear axle with springs and radius rods

sliding, located amidship, while the final drive is through a worm gear. The total reduction in high gear is 8 1/2 to 1 and in low gear 34 to 1.

A Timken worm-driven type of rear axle is employed, mounted on Timken roller bearings throughout. The front axle is also a Timken design, with full Timken bearings. The brakes are on the rear wheels, the bands being 3 1/2 by 1/4 in. material.

THE British National Committee of the International Aircraft Standardization Board has been constituted and has taken temporary offices at the headquarters of the British Engineering Standards Committee. The National Committee is under the chairmanship of Sir Arthur Duckham.

National committees are also being formed in America, Canada, France and Italy. The constitution of the International Commission has been agreed upon and approved, and the Inter-Allied Conference held in London last March is to be considered as the first meeting of the Commission, the second meeting, which will be held in London, being scheduled for the beginning of October next. During the war the Ministry is to be consulted regarding the nomination of British delegates, and after the war any other nation desiring to join the International Commission, according to the statutes, "may do so subject to the approval of the Commission."

# Tests of Benzol as Motor Fuel

Increased Maximum Engine Horsepower and Reduced Fuel Consumption per Horsepower-Hour Shown by Trials Conducted by Automobile Club of America

AT the request of the Barrett company, New York, the Technical Committee of the Automobile Club of America conducted a series of tests with benzol and a benzol-gasoline mixture as fuel for internal combustion engines, and for the purpose of comparison all of the runs were also made on gasoline.

The tests were conducted with a 4-cylinder Continental engine of 3½ in. bore by 5 in. stroke, direct-connected to an electric cradle dynamometer. The engine was equipped with a Stromberg carbureter, Bosch DU-4 magneto and Titan AC spark plugs, the points of which were set 0.015 in. apart. The brake horsepower developed at different speeds between 600 and 2000 r.p.m. was determined when the engine was being run on gasoline, then with a mixture of three-quarters benzol and one-quarter gasoline, and finally with straight benzol. A run of several hours' duration at approximately 1000 r.p.m. was also made successively on gasoline, benzol, and the mixture of the two. All of these tests were made with the throttle valve wide open.

The first run was made on gasoline and the results of the hp. determinations are plotted in Fig. 1. In the same illustration is also shown the fuel consumption at the different speeds. The engine was next allowed to run for 6½ hours at an average speed of 1064 r.p.m., during which run it developed an average of 24 b.hp. and consumed 19.1 gal. of fuel or 2.94 gal. per hour. This is at the rate of 0.122 gal. per hp.-hr.

At the completion of this run the engine was dismantled and a determination made of the carbon adhering to the top of the pistons, which amounted to 1.8 grams. After the engine was assembled again and fresh oil was put into the crankcase, the carbureter adjustment was changed to give a leaner mixture, and the time of ignition was shifted so that the mixture fired 12 deg. after top dead center instead of on the dead center as in the previous run. The engine was

Horsepower and consumption curves for three different fuels

Results of three horsepower runs on benzol

then run on the benzol-gasoline mixture for a determination of the hp. and fuel consumption curves. From the results plotted in Fig. 1 it will be seen that below 1000 r.p.m. there was no appreciable difference in the power developed with the gasoline and with the benzol-gasoline mixture respectively. Above this speed the mixture gave slightly less power, but between 1820 and 2000 r.p.m. the power was greater than with gasoline. A decrease in the fuel consumption was observed above 880 r.p.m., as compared with the run on gasoline, the greatest decrease occurring between 1100 and 1400 r.p.m.

After the horsepower determinations were completed the engine was run for 4½ hr. at an average speed of 1066 r.p.m., during which time it developed an average of 26.6 b.hp. and consumed 13 gal. of fuel. During this run the consumption was at the rate of 2.89 gal. per hr. or 0.109 gal. per brake hp.-hr. This is a decrease of 10.7 per cent from the run on gasoline. It is stated in the report that the engine ran more uniformly during this test than during the test with gasoline and appeared to labor less.

An examination of the engine after this run showed less carbon on the pistons; in fact, if it had not been for a small amount of oil carbon around the edges of two of the cylinders there would not have been enough carbon to weigh.

After the engine had been cleaned and reassembled, four horsepower runs were made on straight benzol. The results of all four runs are plotted in Fig. 2, while the curve plotted in Fig. 1 as obtained with benzol gives the results of the first run. This curve shows an increase in the power developed by the engine with benzol over that produced with either gasoline or the benzol-gasoline mixture throughout the whole speed range. A great deal more power was obtained with benzol than with gasoline, especially at the higher speeds, the increase amounting to 18 per cent at 2000 r.p.m., 9.3 per cent at 1400 r.p.m. and 2 per cent at 800 r.p.m. The fuel consumption which is plotted on the same sheet indicates a decided decrease as compared with gasoline between 930 and 1800 r.p.m. Above the latter speed the decrease becomes less and less, and below 930 r.p.m. the fuel consumption rapidly increased.

Next the engine was run for a period of 4½ hr. on benzol  
(Continued on page 845)

# Labor Representatives Lack Sufficient Power

Confidence Between Employer and Employee Difficult Because Their Representatives Cannot Obligate the General Body to Any Definite Line of Action

By Harry Tipper

"THE third essential, therefore, that I would postulate is that both employers and employed should be efficiently organized in order that industrial problems may receive a broader and more statesmanlike consideration. In many ways Labor is more efficiently organized than Capital, but there are indications of a fatal defect in some Labor organizations, which, if not corrected, may well prove their undoing. I refer to the tendency on the part of the rank and file to refuse powers to their leaders, and to throw over agreements that they have negotiated. It is not characteristic of democracy, but of mob rule, that every agreement should be subject to ratification by a plebiscite, for collective bargaining and even collective negotiation becomes impossible unless the representatives on each side are endowed with authority."—W. L. HICHENS, *Chairman Cammell, Laird & Co., Ltd.*

THE defect in labor organization which Mr. Hichens refers to has been very much in evidence in the war period. The large majority of strikes which have occurred in this period have been carried out by local bodies of workers against the express wish of the general leaders of the organizations and in direct contravention of agreements made by those leaders in the names of the organizations involved.

## When Labor Agreed

When the labor shortage was not so acute and the only prospect of securing a greater share of the remuneration was through the strength of a general organization, the worker was willing to abide by the dictates of the general body to that extent, although even under those conditions there are plenty of instances of the disregard of agreements made by the representatives of labor.

Under the war shortage of man-power for industry, the possibilities of securing greater pay have been sufficiently alluring to particular sets of workmen in individual localities to induce them to strike against their own agreements and against their

direct responsibilities to their own organization constitution.

There is little doubt that the efficiency and character of the labor organizations has been weakened by this decrease in the power of the regularly constituted representatives and the elected authorities.

In political matters it would be impossible to have any orderly government if the whole body of the people were to pass upon every individual action of its representatives and change their decision at will; and this would be equally impossible if groups of the people were to disregard the obligations incurred by their representatives and act against such obligations and outside their agreed constitution.

There is some danger that we have not thoroughly learned this lesson even in political matters.

It is sure that any collective bargaining, which is to leave industry in a stable condition to pursue its normal functions of production and distribution, must be made between men who are capable of obligating the bodies of which they are the accredited representatives.

There is a feeling of lack of confidence in the conferences and discussions between employers and labor organizations at the present time, due in part to the lack of power held by the representatives in many cases and the impossibility of their obligating the general body of labor to any given line of action.

## No Value in Separate Action

If this tendency to separate action continues on the part of groups within the labor organization, as it has been observed during the war period, then the occupational labor organization as it is at present constituted will be without any value for the purpose of decision of industrial relations.

The reason for this lack of power and this partial disintegration of the labor organization is fundamental. The question of wages and conditions of work is an immediate and local one. The amount

paid in a distant shop under different conditions is of little importance.

The real problem lies in the position of the worker in his individual shop and in his individual locality.

Were it not for the constant migration of labor and the disregard of labor necessities by the employer, the place of the occupational labor organization would be still weaker, and in that respect the comment upon the situation in Great Britain is very significant, especially so when it is recorded that the labor unions in that country are very strong and in the key industries comprise a majority of the workers.

These questions of responsibility and decision, which have arisen out of the tendency to "mob rule" in labor organization, especially exhibited during war time, give the employer greater opportunity to institute a different method of collective bargaining in his own organization, which promises greater benefits to the workman and a greater measure of responsibility in agreement, as well as a more important incentive to stability of labor and lessened turnover.

### Two Points to Observe

In this connection there are two points to be observed in the results of the experiment recorded in last week's *AUTOMOTIVE INDUSTRIES*, which indicate the character of agreement between employer and employee when considering the matter for the benefit of their local necessities.

It will be remembered that the organization in this particular plant consisted of a body composed of representatives of the workmen, a similar body composed of the salaried executives of the company, a joint conference body between these two, and a final approving body consisting of the officers of the corporation.

It will also be noted that this experiment has been operating for a period of 3 years, or sufficiently long for some basis of understanding to be reached between the different bodies and some degree of confidence to be established.

Without this latter point the results would be of little value, because the real value of such organization cannot be determined until sufficient time has elapsed for a considerable degree of personal acquaintance and confidence to be established.

It will be remembered that the representatives of the workers brought up the question of wage increases at frequent intervals during the last period covered by the report, in common with workers all over the country.

At first these increases had been paid arbitrarily as increases in wage scales. Later, however, the organization of salaried representatives, although feeling that temporary increases should be established, did not feel that the scale should be increased when the scale of prices upon which it was based might recede and make the wage disproportionate and a burden upon the business.

As a final conclusion of the conference between this body and the representatives of the workers, it was agreed to increase the pay by a separate

amount corresponding to the cost of living, to be given in separate envelopes, to be called cost-of-living bonus and to be based monthly upon Bradstreet's index scale.

This is the first time in the records which the writer has examined during a long study of the subject that the wage scale has been based, definitely, upon a cost-of-living basis and allowed to fluctuate at monthly intervals upon that basis.

It is a fundamental change, because it allows the amount of the wage to be variable while the base upon which it is calculated is fixed and understood.

Such a system could never have been put in motion by an employer without involving him in serious labor trouble and perhaps ruining his organization. It could never have come out of the discussions between industrial groups and occupational labor organizations as generally constituted, for the plan would have had no opportunity to be studied.

It came, however, out of the intimate discussions by men who had become thoroughly acquainted, who were interested in the same plant, the same local conditions and the same organization, and it is far in advance—as an experiment in wage calculation—of anything so far recorded.

Of course one successful record, even though it does involve an attempt at wage-making based upon something more than a trade, is not sufficient to indicate a solution; but it does add another to the tendencies which indicate possibilities of solution in the frank and firm tackling of the problem by giving the worker of the individual organization a hand in the decision as regards his own condition, this to be accomplished through permanent machinery which permits the growth of acquaintance and confidence that must be the forerunner of any successful decisions.

A number of such experiments are being established and an article in the near future will be devoted to the analysis of a recent plan.

### Hall-Scott Completes Tests of Twelve-Cylinder Engine

**I**NCORPORATING many of the features of the six-cylinder Hall-Scott engine, together with some new ones, the new A-8 twelve-cylinder airplane engine has just been given its final test at the West Berkeley, Cal., plant of the Hall-Scott Motor Car Co.

The A-8 type engine has a horsepower rating in excess of 450 and a weight of less than 900 pounds. It is stated that the first block tests, late in July, had to be stopped after the engine was placed on the stand, gradually warmed up and run, because it was evident that the power developed was too great for the testing stand. A special one is being built, and a dynamometer of 600 hp. rating has been sent for, on which the final test will be completed. The engine is fitted with a four-blade propeller.

Its twelve cylinders are of 5 in. by 7 in. bore and stroke and are of the pressed steel jacketed type, similar to those which are used in the construction of the Liberty engine. Standardized gears are used throughout, and with the cylinders are made interchangeable with 4, 6 and 8-cylinder engines of the A-5, A-7 and L-6a types of Hall-Scott motor.

We are informed by representatives of the Hall-Scott company that this A-8 twelve-cylinder engine was completed and ready for its preliminary tests May 1, 1917, and had been placed on the testing block, when Col. E. J. Hall, now of the Aviation Service, its designer, was called to Washington.

# The Willard Tractor Battery

Comprises Extra Heavy Plates and Thread Rubber Insulators in Thick Walled Rubber Jars—Battery Supported on Rubber Bumpers and Coiled Springs Are Inserted in the Hold-Down Rods

THE present year has witnessed the advent of electrical starting and lighting equipment on tractors. The successful application of this equipment on automobiles and trucks during recent years developed a new branch in the manufacture of electrical apparatus for this service. The success of this system lies fundamentally in the fact that it is possible to store enough energy from an electric generator at a low rate of charge and have it available at high rates of discharge to start any size of internal combustion engine. This is accomplished by the use of the lead-acid type of storage battery.

Tractor engineers and manufacturers were at first dubious as to whether or not a storage battery would stand the severe service to which it would be subjected if placed on a tractor. The storage battery manufacturer met this situation, however, by developing a new type of battery for tractor service. This battery was built more substantially mechanically and insulated with the threaded rubber insulation instead of wood separators.

During the present year, two large tractor manufacturers used electrical apparatus with a storage battery as regular equipment of their tractors. The next year will witness many more applications of this system.

## Supported on Rubber Cushions

The accompanying illustration shows the new type of tractor battery and mounting as recommended by the Willard Storage Battery Co. of Cleveland, Ohio. Although this battery was developed to withstand the severest vibrations, it is mounted on rubber bumpers, as shown, as an extra precaution. A small coiled spring is placed in the hold-down member over the handles of the battery to take the slight rebound of the battery mounted on these cushions. Formerly, wherever the vibration was severe, such as in truck service, the storage battery was mounted in a cradle supported by four helical springs. All experimental tests on

this new bumper mounting and also service conditions are said to show the new mounting of the battery to be superior in every way to any spring suspension that has been devised.

In the manufacture of the battery, plates 11/64 in. thick are used. These plates are insulated with heavy threaded rubber insulators, the type of insulation that replaced the wood separators on many of the batteries used on automobiles and trucks during the past two years. The material used in the manufacture of the hard rubber jar is required to meet the severest specifications of tensile strength and percentage of elongation. The thickness of these jars has been increased 50 per cent over that used in the automobile type of storage battery. The case containing the cells is made of extra heavy hardwood, the sides being fastened together by means of two long bolts between the cells of the battery.

## Tested on Jarring Board

In the development of this tractor battery a bumping platform was used to give the battery the severest vibration test. The battery was fastened to this platform rigidly without the use of rubber cushions or spring suspensions. A four-point cam arrangement dropped this platform on a solid anvil at a rate of 560 vibrations per minute. In a test of 30 hours' duration the battery was subjected to approximately one million bumps. It was necessary for the battery to withstand this test without any failure before the final construction was approved as satisfactory. Subsequently some of these batteries were tested by doubling the length of time to 60 hours; the battery withstood this test also without failure.

As a result of these tests and also the excellent service given on heavy duty trucks, the Willard Storage Battery Co. recommends the application of this battery for all truck and tractor service:

## Book Review

*Electrical Equipment of the Motor Car*, by David Penn Moreton and Darwin S. Hatch. Published by U. P. C. Book Co., 243-249 West Thirty-ninth Street, New York. 506 pages; 4 1/4 x 7 in. Price, \$2.50.

The volume under review is a reprint of a series of articles which appeared in *Motor Age* of Chicago during the past year. It covers the whole field of electrical equipment, including lighting, starting, ignition, signalling, gear shifting and transmission apparatus, and was written specially for the benefit of the automobile owner and repairman. A great deal of space is devoted to the principles of electricity which are explained with the aid of hydraulic analogies. Magnetism and electromagnetic induction are dealt with equally extensively and next the principles of generators and motors are taken up. There are also chapters on switches, electric lamps and electrical instruments. Following the section on starting and lighting comes that on ignition, which comprises five chapters, one treating of the subject in general, one being devoted to magnetos, another to battery-generator ignition, another to spark plugs and the last to ignition wiring and timing. The two concluding chapters of the book relate to electric signals and accessories and to electric gearshifts and transmissions respectively.

The treatment of the subject is of an easily understood character and the text is well illustrated.

Three views of Willard tractor battery mounted on rubber bumpers

## Sectional Views of Beaver Tractor Engine

*This engine is made in two four-cylinder models,  $4\frac{1}{2}$  x 6 in. and  $4\frac{3}{4}$  x 6 in. respectively. The right-hand view is specially drawn to bring out features of the cooling and lubricating systems*

# Beaver Kerosene Tractor Engines

Of the Valve-in-Head Type—Made in Two Sizes, of 4½ and 4¾-In. Bore Respectively, and in Unit Power Plant and Independent Types

**T**HERE are two sizes of the Beaver four-cylinder tractor engines, both of which are very much alike, there being only a difference of ¼ in. in the cylinder bore, and all parts of the two engines with the exception of the cylinder block, pistons, piston rings, and piston pins, are identical. There is also a slight difference in the length of the push rods, as the larger bore engine requires a somewhat greater compression space and its cylinder block is ¼ in. higher than the other. One of the engines has 4½ x 6 in. cylinders and the other 4¾ x 6.

The four cylinders are cast in a block, and each is fully surrounded by water. The cylinder heads, which contain the valves, are removable, and a copper-asbestos gasket is placed between the cylinder block and the head casting.

The pistons are of conventional design, with three rings above the piston bosses and one below. The piston pins are clamped tight in the connecting-rods, and rock in bronze bushings in the piston bosses.

The crankcase consists of two iron castings which are joined in a horizontal plane through the crankshaft axis. The engine is made in two types, one with bell housing and the other without, to meet the different requirements of customers. The bell housing type is practically always made with provisions for three-point support, two arms being cast on the bell housing and a turned hub provided centrally at the forward end of the crankcase for support on a cross member of the frame. On the other hand, engines without the bell housing are ordinarily furnished with four supporting arms on the upper half of the crankcase, as shown in the cross-sectional view.

## Crankcase Design Varies

In some designs the lower half of the crankcase is provided with a removable bottom plate, and after this plate has been taken off, the sheet steel splash basin can be taken out through the opening in the bottom of the case, in order to be able to get at the bearings. In the bell housing design, however, the bottom of the crankcase lower half is made integral and hand holes with cover plates are provided on either side, through which the main and connecting-rod bearings can be adjusted.

A crankshaft of very rugged design is used. It is of the usual medium carbon steel drop forged type, with three supporting bearings. The dimensions of these bearings (front to rear) are as follows: 2¾ x 3½, 2¾ x 3½, and 2¾ x 4½ in. The crankpin bearings are 2¾ x 2¾ in. and the piston pin is 1½ in. in diameter. The camshaft also is supported in three bearings, the dimensions of which are as follows (front to rear): 1¾ x 3, 2½ x 3½, and 2 x 2 5/16 in. At the forward end of the camshaft there is a very heavy bushing, and the design is such that the whole camshaft with its integral cams can be withdrawn from the engine through the forward end.

The camshaft journals are cut with helical grooves which tend to distribute the oil and to clean the bearings. The main and connecting-rod bearings are of the bronze-backed, babbitt lined type, while the camshaft bearings are bronze bushed. The camshaft driving pinion, and the accessories shaft gear are made of steel, while the camshaft gear is of cast iron. Woodruff keys are used to fasten these different gears to their shafts.

Beaver engines are designed to burn kerosene, and are provided with special vaporizing manifolds in which the inlet manifold is completely surrounded by the exhaust manifold. The engines are of the low-compression type, as desirable for burning kerosene, and the interior surfaces of the combustion

Horsepower and torque curves of 4½ x 6 in. engine

chambers are completely machined. The valve seats and spark plug bosses are entirely surrounded by water. The valves are made of as large a diameter as can be gotten into the cylinder heads, and have a lift of ¾ in. In order to reduce the frictional losses within the engine the cylinders are offset ½ in. from the crankshaft axis. A magneto bracket is provided, and usually a magneto is used for ignition, but in case it is desired to fit a generator and use battery ignition the generator can be mounted on the magneto bracket.

The valves are operated through the intermediary of tappet rods extending up the sides of the cylinders and rock levers on top of the cylinder heads. The cam followers are of the roller type, and their stems are made hollow for the sake of lightness. There is a screw adjustment with ball and socket joint at the upper end of the tappet rod. The rock levers rock on a stationary shaft which is clamped between pillow blocks and caps, and are provided with bronze bushings. The entire valve mechanism on top of the cylinder head is inclosed by cast iron housing, held in place by some of the studs which serve to fasten the pillow blocks to the cylinder head.

Lubrication is by force feed to the main and crankpin bearings, with additional oil feed by splash. There is a gear type oil pump in the lowest part of the oil well, at the flywheel end. This pump is driven from the rear end of the camshaft through helical gears. From the pump the oil is forced through a distributing pipe cast in the upper half of the crankcase and through branch drill holes therefrom to the main bearings, and from the latter it passes through the drilled crankshaft to

# Maybach 300-Hp. Aircraft Engine

Lubricating System—Details of the Oil Pumps, of Which Three Are Used—Cooling and Ignition Systems—Carbureter and Fuel Feed System

## Part III

**S**EVERAL details of the lubrication system have been completely redesigned in the new Maybach engines. The former single oil pump, which was of the plunger type, has now been replaced by three separate oil pumps of the gear type. These, as shown in Fig. 1, are fitted in the bottom of the base chamber. The main oil-pressure pump is at the rear end, while the two scavenger pumps are situated one at each end of the base chamber.

The general principle of the lubrication system is here clearly shown in the special diagrammatic drawing, Fig. 19, which is to a great extent self-explanatory. In this diagram the lubrication system is shown with all the oil pipes and oil-ways marked in black. The system briefly described is as follows: Oil is delivered from the separate oil tank by the pressure oil pump, which is the rearmost pump of the two at the rear of the sump, and forces oil under pressure to the crankshaft journal bearings through an external oil main, which runs the whole length of the crankcase on the induction side, as shown in Fig. 20.

From this main oil pipe oil is forced to the journal bearings through oil ways drilled diagonally in the crank chamber casting through the transverse webs which support the housings of the journal bearings; these are lubricated by a wide helical oil groove cut in the bearing white metal. For the lubrication of the crank pins and the connecting-rod small-end bearings, the well-known Maybach system of centrifugal pressure lubrication is adhered to. In this system the oil, which is forced out through the ends of the journal bearings, is collected by the oil scoops, which are bolted to the outer sides of each crank web, as shown in the view of the crankshaft already referred to.

By centrifugal action the oil is forced up the outer surface of each crank web and led through a channel into the hollow crank pins, thence through a small hole bored radially in each crank pin to the connecting-rod big-end bearings. From the big-end bearings the oil is forced upward to the small-end bearings, with their floating piston pin bushes of cast-iron, through the steel pipe fixed in the center of the connecting-

Fig. 20—Sketches of oil distributing pipe outside crankcase

rods. Details of this design have already been given. Fig. 18 is a detail sketch of one of the aluminum oil scoops, which are bolted in pairs to the crank webs by a bolt which passes through the center of the end crank pin. From the front end of the main oil pipe a steel pipe is connected by a union, which leads to a hole drilled in the crankcase casting, and serves to lubricate the bearings of the camshaft intermediate gears. A restricting plug is fitted into the end of this oil lead, and a similar restriction is provided in the end of the main leading back into the crank chamber, as shown in the lubrication diagram.

A check valve, it will be noticed, is fitted in the main oil supply system. This check valve, together with a small spring-loaded pressure relief valve, is situated inside a small detachable valve chamber, which is attached to the bottom of the crank chamber just beneath the main oil pump. It will be noticed in the lubrication diagram that the excess oil pressure is delivered back into the oil pipe on the supply side of the pump. An oil pressure gage is connected to the main oil lead as shown, and small oil pipes are also taken from the main pressure pipe to the small crank chamber of the fuel pump, and also to the water pump driving spindle.

The two scavenger oil pumps, situated one at either end of the base chamber, are designed so as to draw off the return oil which collects in the small detachable oil sumps in the bottom of the oil base, and to return it to the tank from either end. These scavenger pumps are connected together by a steel pipe, 21 mm. diameter, the ends of which are coupled to the suction ports of the two gear oil pumps. This interconnection of the two pumps to a certain extent balances the oil return to the tank from the front and rear ends of the oil base, enabling both scavenger pumps to operate at any angle of the engine. A small quantity of oil is always carried in the oil base, as shown in the lubrication diagram. The cam-

Fig. 19—Diagrammatic representations of oiling and cooling systems

Fig. 21—Sketch of front oil pump

shafts, tappets and cylinder walls are splash lubricated by the surplus oil thrown off of the crankshaft and oil scoops; and the camshaft and magneto gears are lubricated through oil ways cut in the camshaft bearings at either end. Baffle plates are fitted below the cylinders in the recesses machined in the top face of the crank chamber, as shown in Fig. 22.

#### Constructional Details of Oil Pumps

No provision is made for lubricating the roller bearings of the overhead valve rocker spindles, and no oil holes are made in their brackets for hand lubrication. The general design of all three oil pumps and their delivery is the same. The general construction is clearly shown in the sketch of the front scavenger pump, Fig. 21. A pair of pump gears of the usual formation, 30 mm. diameter, work in a body casting of cast iron. The top pump gear is of steel, and is machined integral with the driving spindle of the pump, while the lower pump gear is made of gun metal. The oil pumps are secured to the machined seats cast on the bottom of the oil base by a stud in each case, which also serves to hold the small detachable oil sumps in position. These oil sumps consist of aluminum castings, into the cupped center of which is screwed a spun brass oil trap, formed as shown in the sectional perspective sketch. These oil sumps are connected to the suction ports of the oil pumps by a passage formed in the sump body castings.

All three oil pumps are driven at the same speed, the two scavenger pumps being connected together by a light tubular shaft which engages with dog clutches at either end; the pressure oil pump is driven off the spindle of the rear scavenger pump through a dog clutch extension of the spindle. The method of driving the oil pumps at the front end of the engine is interesting and unusual. As shown in the sketch, Fig. 21, the driving gear wheel which is mounted on the front extension of the pump spindle is provided with a spring-loaded face ratchet, the teeth of which are cut inside the gear as shown, and engage with similar teeth cut on a flange on the front of the pump driving spindle. The strength of the spring is such as to allow the driving gear to overrun the driving spindle, and apparently in the event of backfiring, all the oil pumps become inoperative, and oil would thus be prevented from being sucked back into the oil base by the two scavenger pumps.

An interesting feature in the lubrication system of these engines is found in the small separate oil filters, which are provided at the top of each of the diagonal oil ways drilled through the webs of the main journal bearing housings. The small filters are screwed into the bosses, which are cast on the outside of the crank chamber, and to which the detachable main oil pressure pipe is attached.

In Fig. 20 the method of attaching the main oil pipe by a set screw and a cap fitted with a leather washer is shown. The set screw is screwed into the top of the filter plug at the top of the drilled oil lead, and a small jet or drilled plug

is fitted below the set screw, the plug being let into a small recess cut in the top of the oil lead. The bore of this plug corresponds to the bore of the restriction formed in the oil lead drilled in the filter plug just below as shown. This device is apparently provided to allow for a special plug to be attached in place of any of the six set screws, which can then be coupled to a pressure gage, thus giving the oil pressure at any of the main bearings.

Further details of the formation of the oil passages drilled through the crankcase to the journal bearings, and also of the construction of the main bearing caps, are given in the sketch, Fig. 22, which shows the underneath view of the top half of the crank chamber. The oil is led round the bearing bolts through circular oil grooves cut in the face of the bearing housings. The small holes drilled in the crankcase above the joints, as shown, communicate with recesses machined around the bolts. These holes are made to prevent the oil from being forced upward out of the engine through the bolt holes in the crank chamber.

#### Water Pump and Water Cooling System

Details of the construction of the water pump are shown in the sectional drawing, Fig. 23. The body of the water pump is attached to the top face of the separate aluminum casting which forms the cover of the magneto driving gears. This gear cover is attached by bolts and studs to the rear end of both the top and bottom halves of the crank chamber. As may be seen in the general arrangement drawing of the engine, the water pump spindle is driven through a dog clutch at its lower end by a short vertical spindle running in a bronze bush bearing; this spindle is driven by a bevel gear meshing with the main bevel fixed on the rear end of the crankshaft.

The water pump vertical spindle, which is 20 mm. in diameter, runs in a bronze bearing, which is lubricated by a screw grease-lubricator. The top portion of the pump spindle bearing is cupped to form the housing for a thrust ball race, above which is fixed the pump rotor.

The pump rotor is a gun-metal casting, having six helical vanes 110 mm. in diameter. The rotor is fixed to the pump spindle on a taper and key, and is locked by a domed nut and locking washer.

The lower half of the pump body is an aluminum casting with an inlet passage 54 mm. in diameter, to which the diag-

Fig. 22—Details of main bearings and oil leads to them

Fig. 23—Section through water pump

onal water pipe from the radiator is coupled by a rubber connection. The top half of the water pump body, which is a gun-metal casting, is formed with six helical passages leading in a reverse helical direction to the water pump rotor. These passages connect with the common vertical outlet passage in the top of the body casing as shown in Fig. 23. The outlet diameter is 50 mm. The center portion of the top body casting inside the helical passages above the pump rotor is domed and fitted with a threaded plug 38 mm. in diameter. This plug is drilled with a 3.5 mm. hole, evidently to prevent an air lock. Two 3 mm. holes are also drilled in the bottom of the rotor between the vanes for the same purpose. It is noticeable that the steel ball thrust race is working to all intents in the water flow, and must therefore suffer by corrosion.

#### Water Circulation

The circulation of the water cooling system is clearly set out in the diagrammatic drawing, Fig. 19, from which it will be seen that the water pump delivers directly into the bottom of the water jacket which surrounds the body of the rear carburetor. As already mentioned, the two carburetors are attached by long studs to the ends of the front and rear cylinders, and the water, after passing through the rear carburetor water jacket in a special passage round the throttle valve, enters the rear cylinder through the two circular water joint flanges. The water passes through the passages cast in each of the six cylinder heads to the front carburetor water jacket, whence the water is forced out through a vertical passage of 50 mm. diameter through a diagonal pipe leading to the radiator, which is slung above the engine from the center section of the top plane.

The radiator is of entirely new design and is shown in the photograph (Fig. 24) fitted to a 260-hp. Mercedes engine. Unfortunately, it has been impossible to carry out any tests on this interesting type of radiator, a separate report on which will be issued later.

According to a French report, this radiator is very efficient. It is of semicircular shape in front elevation, and is formed of hexagonal honeycombed tubes, and exceptionally deep in cross section, measuring 22 cm. The radius of the semicircle in elevation is approximately 32 cm.

The radiator is divided into two separate sections by a vertical baffle plate, as shown in the diagram, Fig. 24. Water enters the bottom of the left-hand side of the radiator through the pipe leading from the front carburetor, and flows upward through the tubes of the left-hand of the radiator to the top portion of the tank which completely surrounds the radiator. The water passes over the top of the dividing baffle plate, through the right-hand section to the bottom of the radiator,

and out at the rear side, which is connected with a 50 mm. pipe to the inlet passage of the water pump.

As will be noticed, the front of the radiator is fitted with a blind, which is operated by a cable from the pilot's seat.

The two Bosch ZH-6 type magnetos are mounted on brackets cast on the rear end of the base chamber, and are driven at 1.5:1 engine speed directly off the rear end of the camshafts. The ignition point is set 38 deg. early. Two Bosch 3-point plugs are somewhat inaccessibly fitted in the head of each cylinder between the twin water connections as previously described. The plug bosses are water cooled. The high-tension cables are carried in fiber tubes bolted to the cylinders, and the leads to the plugs are taken through fiber blocks mounted on the sheet-metal brackets on the cylinder heads.

Order of firing—1-5-3-6-2-4.

#### Carbureters

The two carburetors are attached to the heads of the front and rear cylinders, as already described, and their general construction is shown in the cross-sectional drawing, Fig. 26. The carburetors follow the distinctive principles of the well-known Maybach design, but are slightly modified in many of their details as compared with the earlier engines.

These carburetors are designed to be used in conjunction with a fuel pump system, and in place of a float chamber employ two small constant-level overflow tanks inside each carburetor. This method obviates the necessity for using pressure release valves in the fuel system. Referring to the sectional drawing of the carburetor, Fig. 26, they are constructed of a cast aluminum water-jacketed body, in the center of which is mounted the rotary barrel-type throttle, open on one side to the curved passage to the induction pipe, and on the other to the mixing chamber above the jets. The main air supply is taken through a passage cast in the aluminum carburetor body directly below the throttle, and the extra air supply is automatically controlled by a guillotine type shutter, which works vertically just in front of the jet control lever. The throttles of both carburetors, together with the mechanically controlled jets and the extra air shutters, are all interconnected.

The working principle of the carburetors and the functions of the various parts are more clearly demonstrated in the purely diagrammatic sectional drawing, Fig. 25, which is, to a great extent, self-explanatory. Fuel is delivered by the fuel pump into the small tank A of each carburetor through a restricting jet B, shown in the diagram. The fuel in these small tanks or reservoirs is kept at a constant level by means of the overflow pipe C, which leads back to the main fuel tank, via the small lower tanks D below the jets which are supplied through the pipe E. An air vent F, fitted with a baffle plate, is provided in the top of the constant level tank A, which is also connected to the main fuel tank by a pipe G, leading to a hand fuel pump, or may be plugged and not used, as was the case in the Rumpler biplane. The main and pilot jets consist of two holes drilled in the top cover of the lower reservoir D, and are similar in principle to the White & Poppe jets. The area of the jet openings is mechanically controlled by means of a small hole drilled eccentrically in

Fig. 24—Radiator and shutter

the jet cap *H*, which, as previously described, is connected by levers to the throttle and air control levers. The function of the top tank *A* is apparently to deal with the large excess of fuel delivered by the fuel pump at high speeds, while the lower tank, which is gravity fed, provides a constant fuel level for the jets.

The mixture strength at any point on the throttle curve is governed by purely mechanical means, there being no venturi of special jet arrangement. The jet depression is obtained by restricting the air flow at what approximates to a sharp-edged orifice; consequently the loss through the carburetor is very high compared with a carburetor using a venturi tube to get the jet depression.

Contrary to usual practice, the jet depression actually increases on throttling down, the depression being about four times as great at half throttle as at full throttle.

#### Control Adjustment

When running slowly, the throttle is slightly open, the supplementary air port closed, and the air shutter practically closed; in this position the small or pilot jet only is open. On opening the throttle, the supplementary air port commences to open in conjunction with the throttle opening. The main air shutter automatically opens in proportion, admitting more air, which passes directly across the top of the jets, and the jet area increases until the main jet orifice is fully open.

Owing to the interconnection of the control levers, there comes a point when the supplementary air port area increases

Fig. 25—Diagrammatic sketch of carburetor

out of all proportion to the increase in the jet area, the latter reaching a limit with no further increase by reason of the arrangement of the levers. This point represents the opening for maximum power at ground-level. If the throttle is opened beyond this point, the air supply rapidly becomes out of proportion to the jet opening and fuel supply. By this arrangement a simple form of altitude control is provided.

The various positions for "slow running," "slow speed," "full speed" and "altitude" are marked on the body of the carburetor, and are indicated by a pointer attached to the throttle lever of the rear end carburetor. By means of these markings on the carburetor the correct settings of the throttle lever can be checked when the engine is installed in the machine.

The translation of these markings on the carburetor is as follows:

- LE = Leer = Running Light.
- LA = Langsam = Slow Speed.
- V = Voll = Full Speed.
- H = Hohe = Altitude.

The induction pipes are aluminium castings and are of exceptionally neat design, being, as shown in Fig. 3, joined together in one straight pipe. A cast aluminium baffle plate drilled in the center with a 20 mm. hole is provided in the center of the two induction pipes between the front and rear three cylinders. This baffle is evidently fitted to equalize the gas supply to all cylinders.

Fig. 27 clearly shows the construction of the interesting type of band clip which is used for making the connections

Fig. 26—Sectional view of carburetor

in the induction pipes, and also for most of the water joints on these engines. These clips are now extensively used on all enemy engines. The method of using these clips is here-with reprinted from the previous report on the 230-hp. Benz engine.

The clips are made of thin strips of annealed spring steel; these are wound twice round the rubber rings and fastened by small steel links and bolts. In starting to make this joint, the end of the steel band is first bent over the bottom bar of the connecting link, and then wound twice round the rubber ring, the free end of the steel band passing through the center portion of the connecting link on the second winding. The end of the steel band is then fastened to the top end of the link by coiling the end several times round the small bolt in the head of the link, the end of the steel band being bent over for about 2 mm. and inserted into a slot cut in the bolt, so that by turning the bolt in the link the steel band is wound tightly round the ring joints, and owing to the position and shape of the link, remains fixed.

(To be continued)

IT is stated that during a recent French offensive the consumption of gasoline for the army and air service was at the rate of 1800 tons per day, which represents a daily consumption of approximately 500,000 gallons of gasoline.

Fig. 27—Sketch of spring hose clip and details

# The F O R U M

## The Magneto Patents Situation

By C. W. Curtiss

*General Manager, Splitdorf Electrical Co.*

THE Federal Trade Commission having granted the Splitdorf Electrical Co. a license under certain Bosch patents, various conflicting notices have appeared in the press concerning the matter.

It is true that the Splitdorf Electrical Co. has been granted a license by the Federal Trade Commission to use two United States patents owned by Robert Bosch of Stuttgart, Germany. I do not believe these patents have been used to any extent by the Bosch Magneto Co., of Springfield, Mass.

Splitdorf Electrical Co. was ordered to make use of these patents by the Secretary of War at the direction of the President of the United States in connection with magnetos for war airplane purposes. The patents do not relate in the remotest degree to the principle of construction embodied in the Dixie magneto which is made under numerous United States and foreign patents owned or operated under by the Splitdorf Electrical Co. only.

The Bosch patents in question relate merely to details, standard practice abroad, which the Government authorities wanted for the following reasons:

### Interchangeable Binding Post

Patent 1,030,817 relates to a binding post for connecting electric cables. This is a detail of construction commonly used abroad and with which European aviators and mechanics are familiar. Naturally by incorporating this detail in the Dixie magneto, cables on foreign magnetos would then readily interchange with the American product, and probably for this reason the Splitdorf Electrical Co. was instructed to use this patent. There are many other ways of attaching a cable to a magneto, and some of them covered by the Splitdorf patent applications pending may even be preferable to the one shown in the patent, but as this was already being used abroad, it was adopted as standard here. The accompanying figure taken from this patent shows the Bosch type of binding post employing a pointed screw piercing the conductor and securing it in place in the insulated brush holder or distributor.

### Hand Magneto for Starting

Patent 1,014,824 relates to an ignition system, wherein a high tension starting magneto is connected to the main magneto in such a way that the starting magneto may be operated by hand in order to furnish a starting spark. The accompanying figure from patent 1,014,824 shows this arrangement.

The main magneto A is connected to the spark plugs in the usual manner. From the distributor of the main magneto

a cable P is connected to the starting magneto I and when the latter is rotated by means of the crank X high tension current will flow into the distributor of the main magneto where it is distributed by means of an auxiliary brush located behind the usual moving brush of the distributor, thereby being connected to whatever cylinder is under compression, and in no way relating to or interfering with the functioning of the main magneto. As soon as the engine has started, the service magneto A operates in the usual manner, the hand starting magneto I being stopped. This arrangement of using a hand starting magneto is standard on many foreign airplane engines, and it was desired to have the American practice conform for the sake of uniformity. There are several other ways of accomplishing the same results, and this patent is not vitally essential to American needs, although its use is desirable for the reason stated.

### Splitdorf Improved Magneto

An improved method is shown in U. S. patent 1,260,985, property of the Splitdorf Electrical Co., by which method the high tension wiring to the starting magneto is eliminated and the arrangement simplified as compared to the Bosch patent. Splitdorf Electrical Co. has manufactured several hundred thousand magnetos for the Allies since the beginning of the war. The Dixie magneto has been standardized and is being produced in great quantities to meet the present emergency, the Splitdorf Electrical Co. now being the largest manufacturer of magnetos in this country.

In addition to furnishing magnetos direct from their own factory for war purposes, the Splitdorf company has arranged to permit the Bosch Magneto Co. of Springfield, Mass., and the Ericsson Mfg. Co. of Buffalo, N. Y., manufacturers of the Berling magneto, to make for war purposes only, and only for the duration of the war, certain Dixie magnetos under the Splitdorf Dixie patents; therefore three sources of supply for the Dixie magneto are available. In addition the Splitdorf company will furnish the necessary drawings and engineering information so that the product of all three factories will be standardized, uniform and interchangeable.

The standardized Dixie magneto enables one magneto to be used for 4, 6, 8, 12 and 16 cylinder engines, and 8 and 12, 45 degree cylinders, with a total of only 16 extra pieces to make up any one of the necessary assemblies. This arrangement, devised and developed under the direction of the Splitdorf company's chief engineer, Carl T. Mason, eliminates the necessity of having several types of magnetos and hundreds of repair parts therefor at the supply depots, and marks not only a distinct advance in the art, but is a notable example of an all-American contribution to winning the war.

Dixie standardized aircraft magneto

Fig. 1—California vaporizer fitted to engine

## Kerosene Vaporization

By L. E. French

THE tube and the hot spot systems of vaporizing heavy fuels for internal combustion engines may be combined successfully in a single equipment, and the two effects may be automatically balanced in such a way that when one is at a minimum the other is at a maximum. This principle is embodied in a vaporizer for which the writer is responsible but which has not yet been placed on the market.

Referring to the illustration, Fig. 1, C is a standard carburetor which discharges its mixture through the nozzle N against the hot spot E. As the charge enters the expansion chamber A the lowering of its velocity causes the heavier particles to be precipitated and collect in the pocket at the bottom. The vaporizer tube V dips into this pocket, passes through the exhaust and discharges into the intake at P. The throttle being placed at the point T causes a difference of pressure between the two ends of the vaporizer tube. This draws air through the tube, together with the liquid and vapor collecting in A.

An idling tube I provides a vaporized mixture on closed throttle.

Fig. 2 shows the variation in the intake suction which occurs in an engine driving a car on a smooth, level road, and also the variation of the exhaust temperature. It will be noted that at the time the exhaust temperature is a minimum the intake vacuum is a maximum and vice versa. This has an important bearing on the action of the vaporizer. Where the hot spot system alone is relied upon, the surface heated must be made large enough to take care of the vaporization at the lowest exhaust temperature.

With the system in question, when the throttle is closed, there is a very strong suction on the vaporizer tube which draws the maximum quantity of air through the tube at this time. Thus when the exhaust temperature is down to its lowest point practically all the air of the mixture is heated by passing through this tube and the high velocity assists in breaking up the fuel. The more volatile particles of the fuel are evaporated on the hot spot E, while the less volatile are taken care of by the tube V. An experimental glass insert in the vaporizer tube has shown that the amount of liquid passing through the tube varies inversely with the volatility of the fuel being used.

On open throttle the increase in the exhaust temperature enables the hot spot to take care of a larger percentage of the evaporation.

In an article by Mr. Tice in the March 14 issue of AUTOMOTIVE INDUSTRIES he makes the following statement:

"In the case of kerosene particularly, the unsaturated hydrocarbon content is quite appreciable; and it is well known that among these substances polymerization, or the formation of resinous condensation products, occurs under these conditions. These latter leave a considerable and very obnoxious solid deposit when heated to dryness.

"The result is that with the heated passage method of pro-

Fig. 2—Variation of intake suction with car speed

gressive evaporation all this residual matter and whatever polymerization products may have been formed are brought to dryness within a comparatively small portion of the length of the passage. The obvious result is a deposition in the passage of solid matter. This reduces its efficiency as a heat transmitter, and increasingly reduces the capacity of the passage. Naturally the smaller the bore the sooner will it be choked to an extent to interfere with the functioning of the engine."

The apparatus with which Mr. Tice tried this experiment was no doubt one in which the velocity of the air through the vaporizer tube was comparatively low.

With the high suction and consequent high air velocity employed in the system in question there is no deposition of solid matters in the tube. This may be partly due to the constantly varying suction which would prevent the vaporization point from remaining constant. At all events, in a recent run from Cincinnati to San Francisco with this apparatus, where fuel was obtained in ten different States, there was no formation of solids in the vaporizer tube, although it is safe to assume that the bore of the tube was considerably less than the one to which Mr. Tice refers.

## Tests of Benzol as Motor Fuel

(Continued from page 834)

at an average speed of 1077 r.p.m., during which run it developed an average brake hp. of 25.9. It consumed 13.2 gal. of fuel, which is at the rate of 2.78 gal. per hr. or 0.107 gal. per brake hp.-hr. This corresponds to a decrease in fuel consumption of 12.3 per cent as compared with gasoline. After the test was completed the engine was again taken apart for the purpose of determining the amount of carbon deposited on the pistons, valves, valve caps and spark plugs. The pistons were practically clean at the center, there being a little oil carbon around the edges. This was less than after the run on the mixture. There was a little carbon on the valve caps, but this was of such a texture that it could be easily removed. The porcelains of the spark plugs were clean and the inlet valve showed no carbon at all.

The test with 90 per cent benzol (motor fuel) showed that it was capable of giving a greater brake horsepower throughout the speed range of the engine than was obtainable with commercial gasoline. The increase varied from approximately 4.4 per cent at 800 r.p.m. to 19.4 per cent at 2000 r.p.m. Above 930 r.p.m. the fuel consumption with benzol was less and the engine ran more uniformly, and less carbon was deposited. The reason for the great increase in brake horsepower with benzol is thought to be the fact that it vaporizes more easily and that a mixture of benzol vapor and air burns completely and leaves very little carbon residue. Nothing was changed on the engine during the tests except the timing of the spark and the setting of the carburetor.

The tests further proved that a fuel mixture consisting of three parts of 90 per cent benzol and one part gasoline gave a brake horsepower equal to or slightly lower than that obtained with gasoline.

## The Outlook for Tractor Exports

FROM the beginning of the tractor industry in this country there has been a very gratifying demand for its products abroad. It is in the nature of things that farm tractors are needed most in newly developed countries where the individual holdings are large and the available farm labor is relatively small in amount. During the past two years the demand for tractors in England, France and Italy was so great that in spite of the great scarcity of shipping, the Governments of these countries found shipping space to carry many hundreds of tractors from here. When peace returns there will be an increased demand for tractors in every one of the countries which participated in the war, because of the enormous reduction in horses and farm laborers, and of the need for placing all available acreage in cultivation again as soon as possible. There are not wanting signs that this state of affairs is fully realized in the different countries.

In France a national association of tractor manufacturers and traders recently held a demonstration to encourage the development of this branch of industry and large industrial concerns in other countries have had representatives here to study American practice in this field. With our lead of several years in tractor design, the urgency of the foreign demand and the obstacles to a rapid development of new industries in the war-ridden countries it should not be difficult for us to build up a large export trade in tractors.

## Reform in Engineering Education

THERE has been a good deal of complaint in the past that the methods of instruction employed in our engineering schools do not meet practical requirements. The student is being taught a lot of principles and a lot of theory, but he is not shown the application of these to practical problems. The result is that when he graduates he is not fit to immediately enter upon responsible work, but must virtually pass through another course in the factory to learn the methods by which engineering problems are solved in practice.

A great deal of time is necessarily spent in engineering courses on such subjects as pure mathematics and theoretical mechanics. These are subjects in which the engineer should be well grounded, yet unless he is given opportunity to apply his mathematics and mechanics to practical problems during his college course he is apt to forget much that he learned before he has a chance to use it. There may be, later on in the course, instruction in machine design and on steam and gas engines, yet the application of the principles taught the student in his mathematics classes is not made sufficiently clear to him, and as a result his mathematical equipment becomes largely a useless tool.

In the education of lawyers the same observation has been made. That is, the student is taught legal principles and precepts, but the connection between these and the cases that arise in the law courts every day is often not sufficiently obvious to make their application easy. To meet this condition the "case system" of instruction was introduced in law schools. The professor picks out a certain number of cases that have come up in the courts and analyzes them, showing how legal principles are applied in each.

It has recently been suggested that a similar method be used in engineering instruction. By collating a set of problems that come up in the work of the practicing engineer, analyzing these problems for the students and showing them how the solutions can be obtained by the application of mechanical principles and engineering data, the teacher could impart to his students, along with the fundamentals of mechanical science, their applications in everyday work, and the young engineer upon entering the drafting room or shop would then not meet with the same difficulty in utilizing the knowledge he has acquired that he often meets with at the present time.

## The Necessities of Reconstruction Are at Hand

**T**HE collapse of the Central Empires brings the end of hostilities. The work of reconstruction is at hand. There is no place in reconstruction for the wildly excited optimist who cannot wait to lay one stone carefully upon another.

There is no place for the pessimist who fears to go to work lest the design be changed after he has started, and there is just as little for the reactionary who must let everything drift in the hope of Providential intervention.

It is a time for confidence.

Confidence, which springs from the belief that man is greater than his machines.

Confidence, which knows that industrial machinery, financial systems, methods of trade are but the tools with which the spirit of man works out its purpose.

Confidence, which springs from sanity of thought, clear planning and careful action.

It is to you, industrial leaders, manufacturers, engineers, constructors of all kinds, that the country must look for that courageous confidence and careful operation which characterized the building of our industrial supremacy.

It is your influence—so much larger than you imagine—your reputation for practical wisdom, which must be exerted to impress on employee, dealer, neighbor and all business men the fact that the serious problems of reconstruction will presently vanish if they are vigorously tackled.

Your influence and action should express that faith which can actually move mountains of difficulty—faith in our citizens, faith in our country and faith in our industrial ability.

The new structure of American industry must be more beautiful, more permanent, more useful.

The difficulties of its building are but the opportunities of its builders.

It is time to be ready, feet on the ground, stable and solid, facing the problems confident of ability to overcome them.

# □ Latest News of the

## 8 Months for Plants to Come Back

Manager Reeves of N. A. C. C. Estimates This Time Will Be Necessary

NEW YORK, Nov. 8—It will take the motor car manufacturers as a whole about nine months to get back to 100 per cent production, stated Manager Alfred Reeves, of the National Automobile Chamber of Commerce, to-day. Getting out of the war will be almost as big a job as getting in.

Factories now, he said, have not stocks sufficient for production and would have to acquire new stocks before production could assume any great proportions. The return to normal would be gradual. The factories, which now are at 50 per cent or less, would come back by degrees and would hit first 50 per cent, then 75 per cent and then 100 per cent. This means that before-the-war production cannot be expected much before next September.

Schwab is said to be turning back 30 per cent of his ship steel, which he is unable to use because of the status of the shipyards, due to various causes.

Steel, Reeves believes, will be rationed for some time during the beginning of the peace period.

Many of the manufacturers have, during the lull in normal manufacture, been experimenting with new engineering and body designs, and, while before-the-war models might come through in a few months, the new designs could not be expected in quantity before the end of next summer.

At a meeting of the Chamber directors yesterday statistics produced showed the industry to have shipped on a 48 per cent basis in September and on 40 per cent or less during October.

In September the carloads shipped were: 1917, 20,538; 1918, 9900. October: 1917, 21,403; 1918 (incomplete figures), 8000.

Roy Chapin reported that at the elections the road bonds of Pennsylvania for \$50,000,000 and of Illinois for \$60,000,000 were carried, to pull both States "out of the mud."

It was coincidental that the day war was declared the Chamber was in session, and wired the Government an offer of co-operation for war work. Yesterday while the Chamber was meeting the United Press report of peace came, which later proved to be unconfirmed, and the Chamber at once wired an offer of its services for reconstruction.

Manager Reeves, who has maintained his home in Yonkers, N. Y., just outside

New York City, and a war residence in Washington, has removed his family to the Capital, and will reside there permanently until developments warrant his return.

Reeves expressed gratification at the co-operation effected a few days ago in Washington when representatives of the car makers, parts makers, jobbers and dealers entered into a joint session on war problems.

### Peace and the Motor Stock Market

NEW YORK, Nov. 14—Any anticipations that the signing of the armistice would result in a wave of buying throughout the country generally have proved unjustified. The usual rises or falls of a few points in leading motor stocks have occurred, but there has been nothing in the way of spectacular dealing and it seems likely that everything will continue on a normal basis until such time as the market adapts itself to the new conditions.

It is conceivable that the uncertainty surrounding the steel situation in view of the amended statement that France is likely to need at least 10,000,000 tons for reconstruction work has had its effect, despite the announcement that passenger car manufacturers would benefit materially and immediately by the revision of priority orders covering the supply of raw material.

Reconstruction schemes also may have a far-reaching effect on the post-war plans of the automotive industry.

## Washington S.A.E. Section Formed

WASHINGTON, Nov. 13—A Washington section of the Society of Automotive Engineers was inaugurated here to-night at a meeting of members of the society and guests when it was voted that a petition asking the creation of the section be presented to the parent organization. The meeting was attended by several hundred and presided over by Herbert L. Chase. Discussions about the value of a section and its co-operation with the Government were combined with talks on internal combustion engine work in the Army and Navy by officers present at the meeting. Temporary officers were elected for the section as follows: Colonel James Furlow, Motor Transport Corps, temporary chairman; Orral A. Parker, Division of Military Aeronautics, temporary vice-chairman; Herbert L. Chase, temporary secretary, and Arthur B. Cumner, Washington representative for the Autocar Co., temporary treasurer. Dec. 11 was set as the date for the next meeting.

## Reconstruction Body Proposed

President Considering Formation of Commission to Supervise Industrial Transition

NEW YORK, Nov. 14—Reconstruction of industrial activities undoubtedly will be one of the greatest problems with which manufacturers will have to contend, now that the signing of the armistice with the Central Powers has become an accomplished fact. Already there have been grumblings of discontent from labor. Telegrams are pouring into Washington from manufacturers throughout the country who are anxious regarding their workers and regarding the contracts for which they are obligated to the Government.

Just what steps will be taken to clarify the situation, and to insure the release of thousands of workers from war work and their transfer to other industries, it is too early to predict. Some inkling of how this may be accomplished, however, comes from Washington, where it is stated that President Wilson already has under consideration the appointment of what is termed a Reconstruction Commission. It would be the duty of such a commission to develop a program for the conversion of the country's business from a war to a peace basis. Should such a commission be appointed it likely would be advisory rather than executive, with its plans to be carried out by existing government departments.

It is stated that consideration being given such a commission includes representation of commercial, industrial, labor, agricultural and social interests. It is thought that such a commission, composed of men thoroughly qualified to handle the complex problems of the situation, could lay down a program which would be more satisfactory, both to capital and labor, than any program that might be arranged by a congressional committee.

Along with the telegrams of inquiry which are reaching Washington are coming hundreds of suggestions for means of transferring war labor to peace labor without too much of a jolt. It is suggested that the reconstruction committee might operate not only in formulating a plan but also as a clearing house for such suggestions. It would take up, in addition to the adjustment of labor problems, the distribution of war materials at present contracted for, or in the hands of manufacturers with war contracts, so that supplies could be equitably distrib-

## Tractor Curtailment Order Is Modified

**American Tractor Association Succeeds in Having Restrictions on Smaller Makers Reduced—Want Official to Pass on all Tractor Matters—Would Eliminate Converters**

WASHINGTON, D. C., Nov. 12—Manufacturers of farm tractors who have new designs ready for the market are to be permitted to go ahead with the development of their plans, and under a ruling which has been obtained by the War Service Committee of the American Tractor Association, they will be assured of such production as will secure them a place in the trade during the coming year.

Following conferences between this committee and the Priorities Division of the War Industries Board restrictions curtailing the production of tractors during the year ending Sept. 30, 1919, have been very materially modified.

Instead of limiting the larger manufacturers to 75 per cent of the iron and steel used in the previous year and virtually cutting off the smaller manufacturers, the new regulation gives the small men a fair chance to develop while conditions affecting the larger makers are not greatly altered.

The revised ruling secured through the efforts of the American Tractor Association and issued over the signature of Judge Edwin S. Parker, Priorities Commissioner, follows:

### The New Regulations

(a) That the tractor makers who have produced less than ten tractors during the first period (year ending Sept. 30, 1918), are in the primary experimental stage, and that they are not to produce more than twenty tractors during the second period (year ending Sept. 30, 1919). Provided, however, that such tractor makers as have, prior to Nov. 1, 1918, contracted and placed absolute orders for a substantial portion of the parts for more than twenty tractors for delivery during the second period may produce such number of tractors (not exceeding 100) as may have been so contracted for and ordered.

(b) That the tractor makers who have produced and had in field operation ten or more tractors during the first period are in the secondary development stage, and that they are not to produce more than 100 tractors during the second period.

(c) That makers of tractors other than farm tractors, whose development stages shall be comparable to those of the tractor makers described in the preceding paragraphs are to produce according to the same rules.

(d) That tractor makers who have produced and sold more than 100 tractors during the first period, and all other manufacturers of farm operating equipment who are past their primary and secondary development stages, will receive during the second

period not exceeding 75 per cent of their receipts of iron and steel during the first period; provided that the tractor makers described in this subdivision may produce at least 100 tractors.

The revised decision not only assists the smaller manufacturers of tractors but also helps the makers of parts. Many of these who are depending upon new tractor concerns, many of them already having large contracts for parts which had necessitated considerable increases in manufacturing facilities, instead of facing a large and certain loss of business and money, will now be able to protect themselves at least in part.

The case presented by the American Tractor Association set forth the foregoing facts and substantiated them by an array of figures secured through a questionnaire which was sent out to tractor manufacturers and parts makers by the association. The returns from this questionnaire were collated and tabulated, and presented such conclusive evidence in favor of the demands of the association that in simple justice a revision could not be denied.

The requests of the association were formulated in a brief which was presented to the Priorities Division at a hearing before Rhodes S. Baker, Assistant Priorities Commissioner. These were summed up under five heads, as follows:

### The Association Requests

1. An official to be appointed by the War Industries Board to pass on all matters pertaining to farm tractor production and distribution, and allotment of materials.

2. A Farm Tractor Committee, to be representative of the entire farm tractor industry, including manufacturers of finished tractors, tractor parts and tractor accessories, to be formed to co-operate with this official.

3. A ruling to be made on the number of tractors of each model to be permitted to be manufactured by each concern, with due regard to the amounts of actual capital invested and available for use in the tractor business.

4. A ruling to be made to prohibit entirely the manufacture of attachments for converting automobile and motor trucks into tractors for farm use.

5. Inventories as of Oct. 1, 1918, to be submitted in itemized form to the Government tractor official, together with all other information that will enable him to make an equitable allotment in each case.

Not all that was asked for by the association was granted. Neither was it al-

together denied. In a letter from Mr. Baker to B. F. Sprankle, chairman of the War Service Committee of the association, after expressing regret that the Priorities Division could not grant all the modifications of Circular 35 asked for, he continues: "Your committee, however, may feel free at any time to bring the matter to us again for reconsideration if, in your judgment, war conditions or the war program shall be substantially different from the present."

### Expect Further Modification

Since this letter was written the armistice with Germany has been signed and the war has ended. War conditions are "substantially different," and the War Service Committee believes that the war program also will be different in the near future. This emboldens individual members of the committee to predict that while it may be some time before it can be announced officially, nevertheless it is practically certain that further concessions will be granted to the manufacturers of tractors. Indeed, some go the distance of asserting that it will be perfectly safe for tractor manufacturers to go ahead in furtherance of their plans as made prior to the original restrictive ruling of the Priorities Board, confident in the belief that the radical change in war conditions will permit of the early removal of all sorts of restrictions on industry.

One of the projects which the association will push is that of a permanent tractor and parts exposition, to be located on the first floor of the Joseph Leiter building, south of Van Buren Street on State Street, Chicago, formerly occupied by Siegel, Cooper & Co. The step preliminary to bringing this project before the members of the association will be taken up at a meeting of the executive committee, which will be held in Chicago the latter part of this week.

### Propose S. A. E. Meeting Jan. 13-14

NEW YORK, Nov. 14—Plans are maturing for a January meeting of the Society of Automotive Engineers. The sentiment is in favor of such a meeting which might be made to cover a great many technical subjects devoted to post-war activities. The thought is to make this gathering a real war work meeting. The dates tentatively suggested are Monday and Tuesday, Jan. 13 and 14. It is proposed to have a general meeting of the Standards Committee on Sunday, Jan. 12 and the usual dinner on Tuesday evening, Jan. 14. In all probability the meeting will be held at the New York headquarters of the Society, The Engineering Societies Building, 29 West 39th Street.

## September Exports to Latin America

New York Ships Automotive  
Products Valued at  
\$1,205,359

NEW YORK, Nov. 11—During the month of September 651 passenger cars valued at \$784,670, 70 trucks valued at \$114,257, and parts to the value of \$306,432 were exported from this port to Latin American republics. The aggregate value amounted to \$1,205,359, a gain of 4.7 per cent over that of the previous month, and one of 10.7 per cent over the average monthly total for the first nine months of 1918.

From January to September, 1918, inclusive, automotive products valued at \$9,799,733 were exported from New York to Latin American ports. The figures have not been limited to this total by lack of orders, as conditions are excellent throughout South and Central America, and the demand for cars, trucks and parts is increasing rapidly. There is still a shortage of transportation, but our shipbuilding program provides for greatly increased accommodation in the near future, and it is therefore reasonable to expect that our trade will increase very appreciably as soon as more vessels are available.

Chile, the country of nitrates, is our best buyer of passenger cars. Cuba leads as a truck purchaser, and Argentina is a long way in front of the others as a buyer of parts.

### New South American Export Rules

WASHINGTON, Nov. 11—Export shipments for the eastern coast of South America, including Brazil, Uruguay, Paraguay and Argentina, will be licensed under new regulations, following Nov. 18, 1918, by which the various shipments will be marked for preferential or non-preferential treatment by the War Trade Board. The new ruling applies to the shipment of all commodities except coal, coke and fuel oil.

### Revoke Chrome Import Licenses

WASHINGTON, Nov. 9—All outstanding licenses for the importation of chrome ore except those covering shipments from Cuba, Canada and Brazil, are revoked after Nov. 11, 1918. Hereafter no licenses will be issued for the importation of chrome ore except licenses covering shipments from Cuba, Canada and Brazil.

### Individual Rubber Import Licenses

WASHINGTON, Nov. 11—All articles manufactured of rubber and imported from Canada or Newfoundland will hereafter require individual import licenses from the War Trade Board.

### Permit Iron Ore Imports

WASHINGTON, Nov. 11—The War Trade Board announces in a new ruling

that licenses will now be issued for the importation of a maximum total of 70,000 tons of low phosphorus iron ore from Spain, Sweden, Norway and North Africa, provided the maximum is imported before July 1, 1919. This amount permitted to come forward will be allocated by the Bureau of Imports.

### Campaign to Save Oil

WASHINGTON, Nov. 8—A campaign to save oil has been inaugurated by the United States Fuel Administration calling attention to the oil that is wasted by leakage. The campaign was started by mailing thousands of letters to oil producers and consumers. Following is the statement:

Dear Sir, "Save Oil":

A recent inspection conducted by one of the largest railway systems in this country developed that 25 per cent of all barrels containing oil were leaking, many of them wasting large quantities. It is not the waste of this oil alone, but there are thousands of dollars of damage done to foodstuffs and other merchandise caused by these leaking barrels. Leakage of this nature, occurring on all the railroads handling barreled oil shipments throughout the United States results in thousands of gallons of oil being daily wasted.

The conservation of oil is a war necessity and is therefore of great importance. I trust that you will give due consideration to every possible way by which your cooperation can be put in the very best condition and thus reduce the leakage loss to the minimum. It has been noted that second-hand wooden barrels are, in some cases, being used after being repainted without being given the necessary attention of re-coopering and that iron and steel barrels are not being properly sealed.

I earnestly hope you will give your whole-hearted co-operation in this matter and in every way endeavor to "stop the leaks and save the drops."—United States Fuel Administration, Oil Division, W. Champlin Robinson, Director of Oil Conservation.

### Importation of Nickel Matte

WASHINGTON, Nov. 11—Nickel matte can now be imported from Australasia provided it is used as ballast in sailing vessels carrying wool and that the maximum quantity to be loaded in any one ship will be 15 per cent of the dead-weight carrying capacity of such ship.

## To Discuss Problems of Reconstruction

Conference of War Service  
Committees Will Meet at  
Atlantic City

WASHINGTON, Nov. 9—Preliminary plans for the War Emergency and Reconstruction Conference of War Service Committees to be held at Atlantic City, Dec. 4, 5 and 6, are announced by the Chamber of Commerce of the United States.

Reconstruction will be given a prominent place on the program, as it is recognized this subject must be taken up by business men to the end that there may be placed at the command of the Government all available sources of information. The work of reconstruction suggests the creation of a federation of all war service committees that whatever study and planning is carried on may be on behalf of all business. War industries and non-war industries are concerned equally in the determination of reconstruction problems. All European countries already are under way with reconstruction plans.

The Atlantic City conference, a call for which was sent out last week by the War Service Executive Committee of the Chamber of Commerce of the United States, will include four general sessions and numerous group and committee meetings. Into the final session will be brought for final action all the proceedings of the meetings.

There will be four general sessions participated in by all the delegates. On Dec. 4 there will be both morning and afternoon sessions, and on the 5th and 6th morning sessions. The chamber is engaged now in obtaining the best speakers available to discuss among others the following suggestions: Reconstruction, industrial relations, raw materials and their control, price control, economic legislation affecting combinations, export and import operations, finance, etc.

The conference will be divided into groups at three sessions, the first to be held on the evening of Dec. 4, the second

on the afternoon of Dec. 5, and the third on the evening of the same day.

On the evening of Dec. 4 each war service committee will meet with its chairman to consider the problems of reconstruction as they affect that particular industry, as well as to take up other problems which the war has demonstrated are vital to industry.

On the afternoon of Dec. 5 the war service committees will meet in groups which are related as to their use of basic materials and as to their distribution problems, etc.

With these groups will meet the commodity or section chiefs of the War Industries Board. Related groups will form themselves into ten major groups on the evening of Dec. 5 to take up the question of raw materials, price control and subjects arising from related group meetings.

After the general meetings of the committees of the related groups and of the major groups it is hoped there will be presented definite recommendations covering the reconstruction period, with the possibility of creating an executive committee empowered to gather data and to function with industries to meet the many problems that the nation's industries will be called upon to solve with the end of the war.

#### Automotive Dealers May Have Lights

WASHINGTON, Nov. 11—Garages, gasoline stations and all automotive dealers are again allowed to illuminate their store or shop windows in New England, New York, Pennsylvania, New Jersey, Delaware, Maryland, District of Columbia, Michigan and Ohio, according to a new ruling by the Fuel Administration.

Under the new order the store or shop window lighting is only restricted when the store is closed and then only on the "lightless nights." Throughout the rest of the country lighting restrictions have relaxed to the extent that they are left to the discretion of the State Fuel Administrators.

The new order prohibits the use of light for illuminating advertisements, announcements or signs or for the external lighting of any building and for displaying a shop window when the shop is not opened for business on Monday, Tuesday, Wednesday and Thursday of each week in New England, Maryland and the District of Columbia.

The order also provides for the entire discontinuance of such use of light Monday and Tuesday of each week in Michigan and Ohio, and in any other State where the Fuel Administration may so order.

#### Driggs-Seabury to Redeem Bonds

NEW YORK, Nov. 12—All first mortgage 6 per cent gold bonds issued by the Driggs-Seabury Ordnance Co. (now the Savage Arms Corp.) other than those maturing Dec. 31, 1918, are called for redemption on Dec. 31 next at 101 per cent of the principal, together with interest.

## Buda Engineers Test New Fuel

### Dasey Says an Inexpensive Re-worked Gasoline Will Be Soon Available

CHICAGO, Nov. 9—Passenger cars could be run 50,000 miles without the need for taking up a bearing, and truck engines would require much less repairing and would last much longer if they were all equipped with good air cleaners. This statement was one of two features of the discussion of a paper on "Lubrication and Fuel Tests on the Buda Tractor-Type Engine" presented by P. J. Dasey, sales and research engineer of the Buda company, to the season's first monthly meeting of the Mid-West Section of the Society of Automotive Engineers last night.

Another feature that made the engineers and dealers at the meeting sit up and take notice was Mr. Dasey's suggestion that there probably would be commercially available in a short time a new fuel—a re-worked petroleum product which would cost much less than gasoline but which, except for ease of starting and for extremely high-speed engines, has as good power and fuel economy characteristics as gasoline.

This product Mr. Dasey in his paper calls synthetic crude, and his paper was devoted chiefly to reports of careful tests in the Buda laboratories of this fuel in comparison with four other fuels, namely, gasoline, cracked benzine, cracked gasoline and kerosene. These tests were made on the new Buda tractor engine model HTU, whose normal speed is 1000 r.p.m., and using a standard Stromberg carbureter.

Summarizing the tests on these fuels and averaging the results of five runs on each fuel for power and economy at different speeds, he found the following in brake horsepower-hours per gallon:

	B.h.p.-Hr. per Gal.
Commercial Gasoline.....	7.80
Cracked Gasoline.....	7.92
Synthetic Crude.....	8.02
Cracked Benzine.....	8.23

The crying need for air cleaners, not only on tractors but on trucks as well, was emphasized. He stated that the Buda factory service men were required to send in samples of the crankcase oil every time they went out on a case of engine trouble. This oil was tested, and in practically every instance of piston scoring, bearing wear and similar troubles, the oil was found highly charged with dirt. It is his belief that the greatest immediate need of the truck field is the universal adoption of some efficient form of air cleaner.

#### Motor Trucks Important in Haulage of Food

WASHINGTON, Nov. 8—That the world will look to America for food and that the motor trucks of the nation will be exceedingly important in hauling food

supplies to shipping points, is the statement of Edward N. Hurley, chairman of the United States Shipping Board, in a letter to the Highways Transport Committee, in which he urges the committee to do its utmost to develop the haulage of food by trucks throughout this country. Following is the letter by Mr. Hurley:

Highways Transport Committee, Council of National Defense—Our merchant marine of to-day and to-morrow will carry a message of good will to the nations of the world.

Millions of cruelly starved folk face westward from every shore with mouths open to the promise of America. These must be fed—and then clothed—and also supplied with the other necessities of life. Our grand privilege is now here to restore life, strength and hope to these martyred brothers of a hundred tongues.

Food must start to flow quickly from every hill and through every valley of the great country behind our shores. Highways Transport must first carry supplies to shipping points before we can start our ships from the ports, and fulfill our promise.

Highways Transport facilities at the farmer's gate—and at every farmer's gate—must immediately suggest the initial phase of ocean transport.

With the promise of the war's end before us the Highways Transport Committee throughout this land could and should render a peace-time service by stimulating highways transport of nourishment and supplies so badly needed. Routes and channels from country to shipping points must be opened up and be efficiently maintained. Resistance in any form to the free flow must be reduced and eliminated. Power and consequently more efficient utilization of man power must be brought about wherever possible.

The United States Shipping Board urges that this message be carried through you and your Regional Chairmen to the state organizations and down through to the great body of patriotic men whose vision can well embrace the crying need of their brothers in other lands for help.—United States Shipping Board, by Edward N. Hurley, Chairman.

#### Joint Highway Meeting in Chicago

WASHINGTON, Nov. 11—A joint meeting will be held in Chicago Dec. 4 of the American Association of State Highway Officials and the Highway Industries Association. Highway and transportation experts will tell of the needs of road construction and of the value of the use of motor trucks for handling freight.

The feasibility of the bill introduced in the Senate by Senator Chamberlain and referred to the Committee on Military Affairs which provides the appropriating of \$100,000,000 for the construction and maintenance of a system of national and State highways, designated to facilitate the movement of troops, equipment, munitions and supplies, will also be discussed at this meeting and plans made to assist in the enactment of it into a law.

This is the first concerted effort of these two bodies, and as there will be present from each State the highway commissioners, the men who really have great weight when it comes to enacting State highway regulations, the meeting should be fraught with much good.

## Buda Develops New Tractor Engine

Similar to Truck Type but Has Detachable Head with Plugs Directly in Cylinders

HARVEY, ILL., Nov. 11—Just how the design of an engine for tractor service must differ from a truck engine is brought out in the new Buda tractor engine, known as the Model HTU. This is the engine used in the Parrett tractor.

The engine is fundamentally identical with the standard Buda HU truck engine, such as is being installed in the Nash Quad for government service. The only differences between the new HTU and the HU are those differences occasioned by the different needs of tractor service as compared with truck service.

The tractor engine, however, differs in that it is made with a removable cylinder head to permit greater accessibility for carbon removal and valve grinding, and more important, the spark plugs are inserted directly into the cylinder head castings, instead of passing through port plugs. This permits the cooling water to be brought up very closely to the spark plug, and also puts the plugs in a better location with reference to the combustion space. The water circulation can therefore be made more ample, with the removable cylinder head, a feature which is necessary under the continued full load conditions of tractor service.

Provision is also made for mounting the fan-driving pulley in front of the gearcase cover, accommodating a flat belt 2 in. in width, and a pad is cast integral with the gearcase cover, on which to mount a fan bracket. This extra large fan belt is provided for to give greater assurance of cooling necessitated by the fact that the tractor engine works at very nearly full load most of the time, and its "road speed" is so low that little assistance can be expected from that source. Lubrication through all bearings is made more certain, under field conditions, by having the oil pan divided, a feature which is not necessary in a regular truck installation. It is worth while, also, to call attention to the S. A. E. flange which is provided for mounting a starting motor, and the generator.

### To Build Fordsons in Mexico

TAMPICO, MEXICO, Nov. 11—It is stated here that the manufacture of Fordson tractors in Mexico will be done by a company which will be organized for that purpose under the laws of Mexico. The commission sent to Mexico by Henry Ford has made its investigations and returned to make its report, which it is understood is entirely favorable to the project.

It is expected that the engineers of the Ford Motor company will arrive in Mexico in about a month and that Monclova, Coahuila, will be the point at which the factory will be built, as it is the most

*The championship banner that was presented last week to the Nordyke & Marmon Co., Indianapolis, for exceeding its October quota of Liberty engines by 246 per cent*

favorable point at which coal and iron can be had for making the steel parts of the tractors.

Mexican products will be used in the manufacture of the tractors and Mr. Ford has declared that none of the money made in the business will be taken out of the country but will be used in increasing the output and increasing the wages and bettering the condition of the employees.

### Illinois to Mark its Highways

CHICAGO, Nov. 9—Now that the direct reason for its formation has been brought to a successful conclusion, and the good roads bond issue has been approved by the voters of the state, the Illinois Highways Improvement Association will not cease its existence, but already has turned its attention to the matter of regulating the marking of the highways and replacing the present conglomerate, unsystematic method of signboarding the roads with some sort of systematic plan providing for standardized signboards giving definite information and on logical routes.

It is possible that a comprehensive plan similar to that the Wisconsin Highways commission has been putting into effect, will be adopted. William G. Edens, president of the Illinois Highways Association has this plan under consideration. In Wisconsin, all the main thoroughfares are officially designated by number, and signs bearing these figures inclosed in a triangle are to be found at frequent intervals along the roads thus far marked. Thus, a motorist driving from one town in Wisconsin to another, follows a route which bears the same number all the way.

## Casting Metal Under Pressure

New Process Similar to Die Casting Developed—Greater Tensile Strength Obtained

NEW YORK, Nov. 12—A metal casting process similar to die casting, but employing much higher pressures and improving the physical qualities of the alloy has been developed by the Morris Engineering Co., 39 Cortlandt Street, New York. As compared with sand castings of the same alloys, castings made by the Morris process are said to possess greater tensile strength and increased density, and to be free from blow holes. The crystalline structure is said to be finer and the machinery qualities are improved.

By the Morris process the molten alloy is poured into metal molds and subjected to high pressure while congealing. Fuse bodies for shrapnel have been made by this process in large numbers, the alloy used containing 80 per cent aluminum and 20 per cent zinc.

### Operations Automatic

The castings are made in an automatic machine which has a capacity of several hundred per hour. Various alloys have been used, including one containing 60 per cent of copper, 40 per cent of zinc and a trace of lead, which when cast by this process shows a tensile strength of 49,500 lbs. per sq. in., an elastic limit of 29,750 lb., and an elongation of 45.5 per cent in 2 in. Another alloy, containing 86.5 per cent of aluminum, 12 per cent of zinc and 1.5 per cent of copper, has a tensile strength of 42,700 lb. per sq. in., an elastic limit of 29,400 lb. and an elongation of 12.5 per cent in 2 in. In the case of the British fuse bodies referred to above, the specifications call for a composition of 80 per cent aluminum and 20 per cent zinc, which must show an elongation of 7 per cent in 2 in. It is stated that the average of 16 tests made on samples of this alloy produced by the Morris process showed an elongation of 14.47 per cent in 2 in., with a tensile strength of 41,440 lb. and an elastic limit of 30,400 lb. The quality of the castings obtained by this process may be judged from the statement made that in filling this order the loss due to rejections amounted to only 5 per cent.

The 90-10 aluminum-copper alloy used for the fuse bodies has been subjected to tests by the U. S. Bureau of Standards and the results compared with tests made on sand castings of the same alloy. Following is an extract from the report made by the Bureau:

"The 10 per cent copper-aluminum alloy as sand cast showed a normal tensile strength of approximately 20,000 lb. per sq. in., with an elongation of approximately 1 per cent (forged) as compared with tensile strengths of from 35,000 to 40,000 lb. per sq. in. and elongation of from 8 to 10 per cent of the same alloy when in the drop forged condition. The strength of the drop forging is almost

double, the ductility from 5 to 10 times as great, the toughness, therefore, from 10 to 20 times as great as that of the sand casting.

"Hard castings can be produced in sand or in dies but they are without exception brittle, having very little ductility."

#### Castings Under Pressure

Alloys of aluminum, copper and iron have been cast by this process which have desirable property of a low coefficient of heat expansion. Such an alloy is said to be well suited for use in internal combustion engine pistons, overcoming some of the difficulties due to the high heat expansion of the ordinary aluminum alloys. Tests of fragments from the frame-work of a Zeppelin show a composition similar to that employed by the Morris company, namely, 91.2 per cent aluminum, 4.13 per cent copper and 3.27 per cent iron. It is believed that the iron was introduced in this alloy intentionally and that it is largely responsible for the high tensile strength, about 40,000 lb. per sq. in. This Zeppelin alloy is similar to one recommended for engine piston cast by the Morris process, the composition being covered by U. S. patent No. 1,227,174.

It is believed that there will be a wide field for the new process in the manufacture of parts for aircraft and automobile engines which have to combine strength with lightness. It is claimed for the process that the physical properties and machining qualities are absolutely under control and that alloys can be handled by it which formerly were impossible. The process is covered by patents in the United States and all important foreign countries.

#### Bituminous Coal Production

WASHINGTON, Nov. 12—Bituminous coal production for the week ended Nov. 2 was 10,965,000 tons, a decrease of 3 per cent, as compared with the preceding week, and practically equivalent to the production of the similar period of 1917. The decrease was caused by the influenza epidemic. Production of bituminous coal from April 1, 1918, to date was 368,858,000 tons, as compared with 326,421,000 tons in the same period last year, an increase of 42,437,000 tons.

Anthracyte production for the week ended Nov. 2 was 1,500,000 tons, as compared with 1,714,000 tons during the preceding week, a decrease of 12.5 per cent.

Production during the week ended Oct. 26 was decreased from 100 per cent by labor shortage, 9 per cent; car shortage, 8.4 per cent; mine disability, 2.6 per cent; all other causes, 1.6 per cent; total, 21.6 per cent.

#### Detroit Office for Lakewood

DETROIT, Nov. 9—The Lakewood Engineering Co., Cleveland, has opened an office in the David Whitney Building, Detroit. R. C. Kimball has been appointed district manager, and will co-operate with manufacturers in the solution of factory transportation problems.

## Rubber Imports Gain in October

### Tonnage for Month Well Ahead of September—Total for Year is Slowly Gaining

NEW YORK, Nov. 13—Imports of crude rubber took a considerable spurt during the month of October, the total tonnage coming in being 4358 tons greater than came in during September. October of this year shows a loss of 461 tons imported as compared with last October, though the total for the year up to date is slowly catching up to the total for the same period last year.

During the first 10 months of 1917 a total of 145,295 tons of crude was imported. During the same period this year imports totalled 140,641 tons, the difference being 4654 tons. This is substantially the amount by which the October imports this year exceeded those of September. Following are the statistics as compiled by the Rubber Association of America:

	1917 Tons	1918 Tons
January .....	12,788	16,084
February .....	10,162	13,108
March .....	18,624	17,161
April .....	13,000	12,703
May .....	18,411	16,288
June .....	15,096	24,124
July .....	17,290	16,092
August .....	17,290	10,421
September .....	13,664	5,151
October .....	8,970	9,509
Totals .....	145,295	140,641

#### Dealers Gather for Implement Convention

OMAHA, Nov. 12—Dealers are coming in early for the tenth annual convention of the Mid-West Implement Dealers' Association. Convention will open officially at 9 o'clock to-morrow morning. Owing to conditions in this territory, past and present, a record breaking attendance is anticipated. An interesting program on the line with resumption of industrial activity has been prepared.

Tractors will occupy a prominent place on the program, but will be handled through the question box rather than by direct addresses. A large and representative display of farm operative implement and tractors is being installed in the Municipal Auditorium, and will be a big feature of the convention.

Included in this exhibit are tractors of the following makes: Nison, Allis-Chalmers, International, Mohine, Wallis, Emerson-Brantingham, Avery, Appleton, Bull, Wisconsin, Cleveland, Parrett, Case, Huber, Advance-Rumley, Hart-Parr, Turner and Townsend.

The implement display covers most of the well-known makers of farm equipment on the market. The motor car interests of Omaha are well represented in the tractor display, as tractors are shown by the J. T. Stewart Motor Co.,

Noyes-Killy Motor Co., Jones-Opper Co., Nebraska White Co. and the Hanson-Tyler Auto Co.

#### New Export Representative

NEW YORK, Nov. 13—Reed, Tilley & Co. has been formed with a capitalization of \$60,000, and will operate as an exporter and foreign manufacturers' representative in South and Central America, Mexico and the West Indies. The company will deal principally in passenger cars, trucks, motorcycles, tires, accessories, tractors, farm lighting systems and electrical supplies. H. A. Reed is the moving spirit behind the new company, which includes Hector J. Tilley, of Tilley, Ramos & Co., and Rufus S. Cole, of the Robertson-Cole Co. The new company has acquired a controlling interest in Tilley, Ramos & Co., thereby acquiring an active branch at Santiago, Chile, in charge of Julian Ramos. The company will also handle the Latin-American business of the Robertson-Cole Co., including Roamer and Harroun automobiles, Reading-Standard motorcycles and Smith motor wheels. The company is also negotiating with other concerns for South American representation. It is planned to establish branch offices in Buenos Aires, Argentina and St. Paulo.

#### Detroit S. A. E. to Hear Wardrop

DETROIT, Nov. 9—The Detroit Section, Society of Automotive Engineers, will hold its regular meeting at the Hotel Pontchartrain convention hall Nov. 29. A government film, "Process of Manufacture of the Liberty Engine," will be shown, after which G. Douglas Wardrop, managing editor of Aerial Age Weekly, who has just returned from France, will deliver a lecture on "The War in the Air."

#### 4800 Miles of Road for Illinois

CHICAGO, Nov. 8—Illinois will begin the construction of 4800 miles of improved roads immediately after the declaration of peace. This is the largest single road project ever proposed, and is made possible by the popular voting of a \$60,000,000 bond issue by the people of the State at the election Tuesday.

#### New Home for Highway Trailer

EDGERTON, WIS., Nov. 11—The Highway Trailer Co., Edgerton, Wis., expects to take occupancy of a large manufacturing addition made necessary by its extensive Government contracts before Dec. 1. The addition gives the company a building 500 ft. long and averaging 75 ft. in width. A new steam heating plant is being installed throughout the factory.

#### American Road Builders to Meet in New York

NEW YORK, Nov. 14—The American Road Builders Association will hold its sixteenth annual convention in New York. The convention will open on Tuesday, Feb. 25 and close on Friday, Feb. 28. There will be technical sessions twice each day and a dinner on one evening.

## U.S. Photographers' Fine Record

100,000 Prints of Aerial Photos in Four Days on Western Front

WASHINGTON, Nov. 8.—Over 100,000 prints of aerial photographs had to be changed out in four days by the aerial photographic force of the air service during the recent offensive west of Verdun and in the Argonne region, according to an overseas report just received here. The aerial negatives had originally been made by French squadrons operating over the sector, but the production of prints on the large scale necessary had been left to the American service. As the offensive was in the nature of a surprise, all the preparatory work, especially the bringing up of American air squadrons, had to be concealed up to the last minute.

The American photographic force was brought together and travelled all night to headquarters, arriving at 9 a. m. By 10 a. m. a laboratory had been improvised in the shed of a brewery and the printing was actually in progress. During the first night, with most limited facilities, 3000 prints were made, and later a record of 9000 prints in 16 hours for a single photographic section established, the latter made possible only by carrying all the water in buckets from a considerable distance.

During the offensive the advance of the troops was so rapid that nearly all the planes and observers were occupied in making visual observations and regulating artillery fire. Aerial photographs, however, were made by the American forces of the results of heavy artillery fire, and proved very valuable. A photographic mission also was sent out along the Meuse to ascertain if reports were correct that all the bridges were down. The results were so good that the exact number of troops, trucks and even machine gun companies in movement at that hour was ascertained.

Valuable lessons were learned in this largest operation of the photographic section yet carried out overseas.

"All of this work," the report says, "was done under the crudest possible conditions, and the results speak very highly for the quality of our men, their ability, resourcefulness and endurance, for there was very little sleep for anyone during those 4 days, but the men all realized the importance of their work and took particular pride in it."

"Photographic sections will from now on be subjected to work under extremely difficult conditions. The area over which the advances are made is usually entirely torn up by the artillery and no shelter of any kind is available, transportation facilities are limited, barracks extremely scarce, and photographic sections often left to shift for themselves. The ingenuity and push of the photographic officer is taxed to the limit."

This report from overseas has given many suggestions for speeding up the training work in this country, particularly the constant references throughout as to the necessity of a highly skilled personnel. As a result the selection of men to train will be somewhat more in-

tensive and an effort will be made to reach the very limited number of men already skilled in photography.

At present there is a shortage of properly skilled photographers. Several hundred men having a thorough knowledge of the manipulation of all kinds of cameras, both speed and view, laboratory work, photographic chemistry, lenses and the working of panchromatic plates are needed at once. Such men may be inducted through the Air Service Test Boards at the following places:

104 Broad St.	.....New York
Second and Market Streets	.....San Francisco
230 East Ohio Street	.....Chicago
739 Boylston Street	.....Boston
610 Locust Street	.....St. Louis
Eleventh and Main Streets	.....Kansas City
Old Army Bldg.	.....Cleveland
Care of Postmaster	.....Los Angeles
159 West Water Street	.....Milwaukee
Chamber of Commerce	.....Cincinnati
Kelly Field	.....San Antonio
Air Service Mechanics School	.....Overland
Building	.....St. Paul

### United Motors Formally Dissolves

NEW YORK, Nov. 12.—The United Motors Corp. has ratified the plan under which this company is to be absorbed by the General Motors Corp. Under the terms General Motors will assume all liabilities and acquire the property of the United company in exchange for 110,164 shares of its common and 330,492 shares of its preferred stock. United Motors stockholders will receive for each 10 shares of stock 3 shares of General Motors preferred and 1 share of common. Cash is to be paid in lieu of fractional shares on the basis of 80 per cent per share for General Motors preferred and \$125 for common.

### Postpone Metropolitan S. A. E. Trip

NEW YORK, Nov. 9.—The trip of the Metropolitan Section of the S. A. E. to the Wright-Martin plant in New Brunswick, N. J., has been abandoned. The Long Island City plant of the company will be visited instead on November 30.

### Economic Aid to Russia

WASHINGTON, Nov. 8.—The War Trade Board of the United States Russian Bureau, Incorporated, has been organized as a corporation of the United States to render unselfish economic aid to Russia. The capital of the corporation is placed at \$5,000,000, the amount of the revolving fund which has been placed at the disposal of the War Trade Board for financing the plans and policies of economic assistance to the Russian people.

### Enlarge Camp Holabird Barracks

WASHINGTON, Nov. 9.—To provide accommodations for 3000 additional men who will be stationed at the motor truck repair depot, officially known as the Mechanical Repair Shop Unit at Camp Holabird, Md., the Construction Division of the Army has been authorized to proceed with work which will cost approximately \$798,000. Barracks will be erected and the water supply will be increased. Additional roads will be built in and around the camp.

## Germany's Gasoline Cut Off

Armistice With Austria Stops All Supplies of Gasoline and Fuel Oil

WASHINGTON, Nov. 7.—The armistice with Austria and the consequent stoppage of all traffic between that country and Germany will cut off all of Germany's supplies of fuel oil and gasoline, according to present information in the hands of the United States Fuel Administration.

Germany has been obtaining fuel oil and gasoline from Galatia and Roumania and was planning to import extensively from the oil fields of the Caucasus. She has no supplies of fuel oil within her own borders and has been using for lubricating oil a derivative of coal tar—benzol. This latter source, however, does not supply her wants.

Italy, which is entirely dependent upon outside source for its coal supply, will not be able to get coal from Austria which has hardly enough for its own use. Germany has in the past occasionally supplied Austria with coal. The Austrian coal mines when worked to full capacity furnish sufficient coal for that country's needs. During recent months, however, because of enfeebled conditions of the Austrian miners—due to lack of food—the coal mines have yielded only from 50 to 60 per cent of their full capacity. The miners have been forced to spend about 3 days of the week gathering such meager supplies of food as they could lay their hands on.

The demobilization of the army will permit the return to the mines of miners in good physical trim and there may be no great suffering in Austria because of lack of coal this winter.

The armistice also, it was pointed out, will relieve the food situation in Austria. In the army the soldiers have been getting much better food than they were accustomed to in civil life. Austrian coal miners, for instance, before the war ate meat only a few times a year, whereas they have been obtaining it daily in the army.

### Pierce Net Surplus \$886,759 for 3 Months

BUFFALO, Nov. 11.—For the 3 months ending Sept. 30, 1918, the Pierce-Arrow Motor Car Co. reports a net surplus of \$886,759 after charges and war taxes are deducted. This is equivalent to \$2.74 per share on the 250,000 shares of common stock after allowing for dividend requirements on the preferred. A year ago the earnings on the common stock during the corresponding quarter were \$5.94 per share, but this figure was arrived at without deducting war taxes. Net operating profits for the 3 months amounted to \$1,338,129, as against \$1,809,729 for the corresponding quarter of 1917, a decrease of \$471,600.

## Contract Adjustment Board Created

Will Hear and Judge Claims Arising Under War Department Contracts

WASHINGTON, Nov. 7—A Board of Contract Adjustment has been created by the Secretary of War to hear and judge all claims arising under contracts made by the War Department. The board is clothed with all necessary powers.

Through the operation of the Board of Contract Adjustment contractors supplying the army will be able to submit any differences that may arise between them and the contracting officers of the various supply bureaus to this board, which will act without any of the technicalities of court procedure, thus insuring a speedy and equitable adjustment. The services of lawyers will not be necessary, as the contractor or his representative may appear before the board and state his case freely and fully with the assurance that he will be given an impartial hearing and a prompt decision. The decisions of the board will be final and conclusive on all matters submitted to it for determination, but appeals may be made to the Secretary of War.

The members appointed on the Board of Contract Adjustment by the Secretary of War are Lt. Col. Christopher B. Garnett (chairman), Lt. Col. H. H. Lehman and Lt. Col. Edward S. Malone. Lt. Col. Garnett was formerly chairman of the Corporation Commission of Virginia, Lt. Col. Lehman is chief of the Methods Section, Purchase Branch, Purchase, Storage and Traffic Division, and Lt. Col. Malone was Assistant Corporation Counsel of New York City for the Borough of Queens. The legal adviser of the Board will be a Judge Advocate appointed by the examiners, who will be commissioned officers of the United States Army and appointed by the Director of the Purchase, Storage and Traffic Division. The office of the Board of Contract Adjustment will be in Washington, but hearings may be held in such other places as may be expedient and necessary for the proper performance of its duties.

### Army Charting Air Lanes

WASHINGTON, Nov. 11—The Air Service of the Army has commenced charting the air lanes over the United States. This work, started for a training of map makers for the A. E. F., it is expected, will be invaluable for the development of the Air Service for the future. The charts are mosaics made by stereopticon cameras showing all the landmarks such as waterways, railroads, cities and mountains for pilots to follow in their cross country flights. These courses are laid out according to the season of the year and depend considerably on the atmospheric conditions reported by the Government Weather Bureau.

At Kelly Field the instructors and the members of their classes work with the aid of the planes carrying the cameras; photographic lorries and motor trucks carrying the photographic material and supplies, and also a portable dark room for developing and printing the plates and films exposed. Such an outfit is usually set up in the district to be photographed in some town which has a landing field adjacent to it. The men employed in the work are rationed from this camp and the developing and printing of the films and plates delivered by the planes are all down here. As fast as one district or zone is finished the outfit moves on to the next.

### Aviators Receive Hospitality

WASHINGTON, Nov. 11—Cities and towns of the Southwest under the air lanes used by Army flyers are rivaling each other in their hospitality to aviators. They are building landing fields, organizing the inhabitants into reception committees and raising money for entertainment. One town, which calls itself "The Dynamo of Central Texas," is sending out invitations by cards to flyers. The cards read:

"Upon presentation of this card all courtesies will be offered you, including shower and pool baths at the Y. M. C. A.'s \$87,000 plant, Country Club's \$75,000 plant, Elks Club's \$47,000 plant. Coffee and sandwiches will be handed out by the Red Cross cantines; hair cut, shave and shine given free at any barber shop; cold drinks at the soda water fountains, also local carfare."

### Liberty Engine Builders Form Association

INDIANAPOLIS, Nov. 11—The men and women building Liberty airplane engines have formed an association in which they pledge themselves to use every effort to keep production at its topmost point. Following the unveiling of a 10,000th motor at Detroit three weeks ago, the United States Liberty Motor League was formed. It now has a membership of over 25,000 workers, in some 600 plants, making Liberty engines and Liberty engine parts, and every day finds thousands more applications. It has been by means such as this League and other methods of keeping the airplane builders' energies at high pitch that the great increase in production for the last month was accomplished.

### Return Loads Bureaus in Canada

MONTREAL, Nov. 11—Arrangements are going ahead whereby the return load system is being got into tangible shape here; already arrangements are being made for a service between Montreal and Schenectady, taking in the entire route between these two points; it is also being arranged to put on a regular service between Montreal, Three Rivers and Quebec, in addition to a constant daily service around the entire Island of Montreal.

## Army Motor Vehicle Control Unified

Motor Transport Corps to Operate All Passenger Cars and Trucks

WASHINGTON, Nov. 11—The pooling of the motor vehicle equipment of the Army under the control of the Motor Transport Corps has proved so successful in the District of Columbia, where it was first tried, as recently announced in AUTOMOTIVE INDUSTRIES, that the system will be extended throughout the United States.

All passenger and cargo-carrying vehicles are included in the order, the effect of which will be to give a more efficient motor transportation service for the Army with a greatly reduced equipment. Heretofore motor vehicles have been assigned to the various departments for their exclusive use. Under the new plan they will be operated under one control and for the benefit of all departments.

In Washington, where the need for passenger cars for official business is great, an elaborate taxi system has been established, consisting of 13 stations connected with an adequate system of telephones. Officers above the rank of captain are provided with cards entitling them to call Government cars when needed, for official business only. Junior officers and civil service employees must have trip tickets to gain the use of the special motor car service. A bus service, operated on schedule between the principal buildings occupied by Army organizations, provides transport over regular routes for officers and employees on official business.

These arrangements have made it possible to reduce the large number of motor cars formerly assigned to officers for their individual use to 23. Only the heads of departments, corps and bureaus are entitled to have cars assigned to them individually. The new system will reduce the motor equipment necessary for the Army's use by about 33 per cent. The vehicles released from domestic service will be available for overseas duty.

Joy riding, the evasion of State license fees by privately owned vehicles masquerading as Government cars and other abuses will be prevented by the rule requiring all army trucks, cars and motorcycles to be painted olive drab and stenciled on the sides and rear in block letters 4 in. high "U. S. A.," followed by the registration number assigned to the car in the office of the Chief of the Motor Transport Corps, and by the words "For official use only."

All chauffeurs will be limited service enlisted men, and will be under military discipline. A complete manual of their duties has been prepared. All persons making use of the motor car service are required to sign for each trip. This makes the use of the service for private

# M.T.C. Organization Completed

**Drake Now Head and Furlow  
Deputy Chief; Seaman in  
Executive Charge**

WASHINGTON, Nov. 9.—The Motor Transport Corps under Brig.-Gen. C. B. Drake, which has charge of engineering, operation and maintenance of the motor vehicles of the Army excepting tanks and tractors, has completed its organization. General Drake is at the head with Col. James W. Furlow as Deputy Chief, supervising the executive maintenance, engineering and liaison divisions. Lt.-Col. B. F. Miller is the assisting deputy supervising property and operating divisions. Lt.-Col. Edward Orton, Jr., is in charge of the service division.

Col. A. O. Seaman of the General Staff is in charge of the executive division, controlling administration, personnel, training, distribution of vehicles, and requisitions and orders to purchase. Col. W. H. Noble heads the property division, John Younger the engineering division and Lt.-Col. W. D. Uhler the operating division. George E. Randles, who was formerly with the Foote-Burte Co. of Cleveland and who had charge of maintenance under Christian Girl, is in charge of the maintenance division controlling the advisory and planning, base and field shops, spare parts and accessories, machinery and tools, crating, motor transport depots and the salvage and engineering.

General Drake, Col. Furlow, Lt.-Col. Orton, Lt.-Col. Uhler, Younger and Randles were all associated with the original Motor Section under Gen. C. B. Baker and Christian Girl.

## Employment For All Says Frankfurter

WASHINGTON, Nov. 13.—That there will be employment for all in this country and that there need be no unemployment, is the opinion of Chairman Felix Frankfurter of the War Labor Policies Board who has given AUTOMOTIVE INDUSTRIES the following statement on this subject:

There is no occasion whatever for any unemployment or misery in this country. There are enough jobs if we carefully make the adjustment that has to be from an energetic war production basis over to the eventual peace basis. With that end in view the Secretary of War, the Secretary of the Navy and Chairman Hurley of the Fleet Corporation, who are the the big production chiefs, met yesterday and at once began the gradual process of adjustment by agreeing to cut out Sunday work and all overtime on Government contracts.

Secretary Baker has also given orders that there should be not curtailment of war work in the War Department, which is of course the biggest war producing agency, except after consultation with representatives of the War Industries Board and the Department of Labor. The point is that before you cut down that

releases raw material, the War Industries Board should know where the material is and the Department of Labor, through the Employment Service should be able to take up any labor released so that there should be a minimum of dislocation involved in turning the country over to a peace basis.

Chairman Hurley indicated that the ship industry would go on in this country and would need as many men as they have now. The whole process is to guide the thing with the necessary intelligence and foresight. As to the wage scales there should be no quick changes because that would be an unhealthy process. I think we want to make a gradual healthy adjustment. I think if the interests of labor are adequately represented in working out these things, labor with the rest of the interests of the country will accept what changes that are necessary in going over over to a peace basis.

What labor should have is what the country is entitled to have. That is the change should not be one-sided, but fairly representative of the Government, labor and industry.

I think there will be a gradual shifting of labor over to peace jobs. We are trying through the Community War Labor Boards to find out what the local community needs are. Some labor will be shifting of course, but a great deal of the movement of labor has been in the shipyards and Mr. Hurley's anticipation is that the ship industry will continue at its present activity.

Overtime and Sunday work will be cut

out. These were merely necessities of the war emergency abnormal methods. We must fasten our minds on this. The needs of this country and the needs of the world call for great productivity by the United States of all kinds of goods. If we keep our heads and if we work these things out in a co-operative way, there ought to be very little dislocation.

I cannot speak in detail of the definite plans of the Department of Labor. Its problem arises from the demobilization both of men actually under arms and men in industries whose activity will be terminated by the war.

## Highway Traffic Association Now Has National Scope

NEW YORK, Nov. 12.—Yesterday's conference of the Highway Traffic Association of the State of New York, at which the subject of snow removal from trunk highways was discussed at length by representative from the North Atlantic and North Central States and from Canada, was followed by the annual meeting.

At this meeting the necessary steps were taken to widen the field of operation and accordingly the association is now one of National scope, with representatives delegated by the various States. The officers were re-elected, as follows:

Honorary president, William P. ~~Steele~~; president, Arthur H. Blanchard; vice-president, David Beecroft; secretary, Elmer Thompson, and treasurer, George H. Pride.

## LABOR SHORTAGE REPORT FOR WAR DEPT. NOV. 15, 1918.

Your labor needs will be given prompt attention if they are filed at the nearest office of the U.S. Employment Service and if this card is mailed on or before Nov. 15th to Capt. O. Finney, Chief, Industrial Relations Section, Bureau of Aircraft Production, New York District, 380 Madison Ave., N.Y.C. THIS REPORT SHOULD COVER ONLY LABOR SHORTAGE ON AIRCRAFT WORK.

purposes quite impossible, while the painting and numbering will definitely identify every War Department vehicle.

#### Propose Air Mail Route to Texas

WASHINGTON, Nov. 6—A bill has been introduced into the Senate by Senator Sheppard to investigate the cost and practicability of an aerial mail route to Texas and the Southwest. It was referred to the Committee on Post Offices and Post Roads.

#### S. A. T. C. Graduates 89,824

WASHINGTON, Nov. 6—The Students' Army Training Corps which has charge of the vocational training of enlisted men and officers for the Army between Oct. 1 and Oct. 28, has graduated 89,824 trained soldiers. Of this number 6341 went into the Motor Transport Corps, 2221 into the Tank Corps and 5729 into the Air Service.

#### Urge Saving of Kerosene

WASHINGTON, Nov. 11—A campaign for the conservation of kerosene and coal oil has been started by the Fuel Administration and directed particularly to farmers, who are asked not to use oil heaters and stoves unless necessary, and who are given instructions in the use of kerosene and oil in lamps, to achieve the highest conservation.

#### More Room For F-W-D

CLINTONVILLE, Wis., Nov. 4—The F-W-D Automobile Co. has virtually taken over the entire plant capacity of the Silent Washer Co. of that city for the period of the war in order to meet the new requirements of Government contracts that until further notice all trucks be shipped in boxes. The Silent Washer Co. manufactures domestic washing machines and is prevented from maintaining production of this product by scarcity of materials and necessary curtailment ordered by the War Industries Board.

#### Stinson Gets Continental Plant

SUPERIOR, Wis., Nov. 4—The Stinson Tractor Co., Minneapolis, has taken over the new motor truck manufacturing plant erected for, but never occupied by the Continental Motor Truck Co., in Superior, Wis., and is installing machinery and equipment so that operations may begin within 30 days. The plant will be devoted exclusively to the production of the Stinson tractor.

#### Hamilton Making Aircraft Parts

TWO RIVERS, WIS., Nov. 11—The Hamilton Mfg. Co., Two Rivers, Wis., has received additional contracts for aircraft materials and parts for the Government which will keep the plant fully occupied well into next year. The Hamilton company is supplying material for 4000 airplanes to the Dayton Wright Airplane Co., and will complete this contract by Dec. 24.

## Trucks Show Saving on Wagon Costs

### Official Figures Indicate Enormous Reduction in Operation Cost When Trucks Are Used

WASHINGTON, Nov. 6—Motor truck hauls in 1918 from farm to shipping point averaged 11.3 miles, while wagon hauls averaged 9 miles; and motor trucks made 3.4 round trips daily over the 11.3 mile route while wagons made 1.2 round trips over the 9 mile distance.

The cost of hauling in wagons from farm to shipping point averaged 30 cents per ton a mile for wheat, 33 cents for corn and 48 cents for cotton, while truck or tractor haulage averaged 15 cents for wheat or corn and 18 cents for cotton. These figures are based on reports made by correspondents to the U. S. Department of Agriculture, Bureau of Crop Estimates.

A similar inquiry in 1906 showed an average for wagons of 19 cents per ton-mile for hauling corn or wheat and 27 cents for cotton. This last year naturally found wagon costs higher due to general price increases, but motor trucks show costs lower even than the wagon costs of 1906 due to greater truck efficiency.

The cost of motor truck hauling for wheat varied in different States with 9 cents per-ton-mile in 1918 in East North Central, 10 cents in the East South Central, 14 cents in New England, the Middle Atlantic and the West North Central, 15 cents in the West South Central, 17 cents in the Pacific, 18 cents in the South Atlantic and 29 cents in the Rocky Mountain States.

Wagon hauling by States amounted to 22 cents in the Pacific States, 26 cents in the North Central States east of the Mississippi River, 29 cents in the West North Central, 32 cents in the West South Central, 36 cents in the East South Central, 39 cents in the South Atlantic, and 42 cents in the Rocky Mountain States.

Most farmers use smaller sizes of motor trucks, usually the 1 to 2 ton sizes, and in a number of counties these are trucks converted over passenger chassis. In some cases trailers are used for farm produce. In North Dakota and California tractors, each drawing several wagons, are used for hauling grain.

For the United States as a whole the average wagon load of wheat was 55 bushels in 1906 and 56 bushels in 1918 as against the motor truck loads which averaged 84 bushels. For corn the wagon loads of 1906 and 1918 were 38 bushels and the motor truck loads for 1918 amounted to 58 bushels. The cotton load for 1906 and 1918 by wagon was 3.4 and 3.6 bales respectively as against 6.6 bales hauled by motor trucks in 1918.

#### Hercules Plant Gets Big War Order

CANTON, Ohio, Nov. 4—A \$2,000,000 order for engines to be used in the stand-

ard army trucks has been received by the Hercules Motor Co. from the War Department. The company is now engaged solely on government work and has taken over an additional plant to meet its increased space needs.

#### New Hangars To Be Built

WASHINGTON, Nov. 7—Eleven new hangars will be constructed at the Aerial Gunnery School, Miami, Florida, at a cost of \$660,000. Three new hangars will be built at North Camp Jackson, to cost \$270,110.

#### Allies Get 72 Per Cent of Petroleum Products Exports

WASHINGTON, Nov. 12—During the month of September the exports of petroleum products to England, France and Italy aggregated 45,509,122 gal. valued at \$7,639,191. Details of the exports to each of these countries are given in the following table:

	England	France	Italy
Fuel oil, gal..	12,882,558	537,749	474,686
Illuminating oil, gal.....	7,674,320	4,805,761	.....
Lubricating oil, gal.....	6,221,046	1,468,490	1,366,990
Gasoline, gal..	4,357,588	2,079,863	.....
Other naphthas, gal. ....	2,619,458	.....	1,010,613
	33,764,970	8,891,863	2,852,289
Total value.	\$5,393,820	\$1,418,547	\$336,814

#### Massachusetts Considers Legislation

BOSTON, Nov. 9—At a meeting here Thursday at the State House representatives of the automobile industry, owners of trucks and cars, and accessory men discussed with a committee comprising the Highway Commission, and other State officers the problems of motor legislation. The last legislature passed a resolve calling for an investigation by the Highway Commission, and Secretary of State A. P. Langtry and Thomas W. White of the Administration Board. The subject of increased fees on trucks was the first matter taken up, but that had no sponsors, but a number of objectors who pointed out that with five and six taxes next year increased fees by Massachusetts would not be fair. The weight of loads was thoroughly talked over, whether it would be possible to limit vehicles to a total of 10 tons including the weight of the vehicle; or the use of two smaller vehicles instead of one large machine, etc. The opinion seemed to be that the 14-ton limit now was pretty nearly right for here. The length and width of body were other topics, as were headlights, the controlling of jitneys, the probability of trailers and tractors coming into general use, etc. A committee was appointed to consider a suggestion made by John H. Johnson of the N. A. D. A. that the dealers be divided into three classes, Class A the men who handle cars and trucks as factory representatives and their sub-dealers; Class B those handling used cars solely, and Class C the men who junk cars. It was brought out that many people have dealer licenses who are not entitled to them, and so they will be curtailed next year.

# 150,955 Tractors in 2½ Years

During the First Six Months  
of 1918, 58,543 Were  
Manufactured

WASHINGTON, Nov. 11—Eleven thousand three hundred and eighty-eight tractors were in the hands of manufacturers, in transit or in the hands of dealers in August, 1918, according to a report just filed by the office of farm equipment, United States Department of Agriculture, following an investigation of the tractor situation in this country.

Investigation was for the purpose of securing accurate information to facilitate adequate and equitable distribution of farm tractors throughout the country. In connection with the inquiry a report was received from every tractor maker in the country concerning tractors manufactured and their distribution between Jan. 1, 1916, and July 1, 1918. Following is the summary of the compilation of the replies:

## NUMBER OF TRACTORS MANUFACTURED

1916 .....	29,670
1917 .....	62,742
January 1 to June 30, 1918.....	58,543

Total for 1916, 1917 and first half of 1918 .....

150,955

## NUMBER OF TRACTORS SOLD

### To Users

1916 .....	27,819
1917 .....	49,504

### To Exporters

1917 .....	14,854
1918, first 6 months.....	15,610
Number of tractors on hand, in transit or in hands of dealers at time of report (August, 1918) .....	11,388

## Restrain Milwaukee Tank

WASHINGTON, Nov. 7—The Federal Trade Commission to-day ordered the Milwaukee Tank Co., Milwaukee, makers of automatic measuring oil pumps, tanks and devices for the storage and handling of gasoline and other volatile liquids, to discontinue "divers means and methods of inducing and procuring a large number of its customers and prospective customers and the customers and prospective customers of its competitors to cancel and rescind orders and contracts for the purchase of pumps, tanks and outfits placed with said competitors." The concern agreed to issuance of the Commission's order waiving right to introduce testimony in support of its practices.

## Westinghouse to Close Indianapolis Office

INDIANAPOLIS, Nov. 4—The Westinghouse Electric & Mfg. Co. will close its local office on Dec. 1 for the period of the war. The business of the territory hitherto handled from Indianapolis will be dealt with at the Chicago office, Conway Building. Prescott C. Ritchie, now in charge at Indianapolis, will manage the Chicago office.

## OPERATOR'S PROGRESS CHART

PRODUCTION SCALE CHART.

Instructor's Name & No. **RICHARD ROWE 10-076** Part Name & No. **226041**  
Operation No. **2711** Date **8-14-18** Operator's Name & No. **PAUL WEST 69-148**

## SALVAGE SCALE CHART

Instructor's Name & No. **RICHARD ROWE 10-076** Part Name & No. **226041**  
Operation No. **2711** Date **8-14-18** Operator's Name & No. **PAUL WEST 69-148**

THE chief instructor of the training department of a large manufacturing concern engaged upon aircraft production has forwarded to the Training and Dilution Service Department of Labor actual sample copies of their "operator's progress charts." These charts are of unusual interest because they visualize so clearly the value of training unskilled workers. They are reproduced herewith for the benefit of other manufacturers.

A glance at the Production Scale Chart will readily show that in the first hour this unskilled worker was able to turn out 5 pieces of repetition work. But the Salvage Scale Chart registers 4 spoiled parts against him, hence his net production for the first hour was but one part. At the end of his second hour's work his production had increased to seven parts, yet his salvage remained at the same rate as that of the first hour's work. Had he been allowed to continue in the old method of "breaking in," having to work out his own salvation in a sink-or-swim fashion, his salvage would no doubt have remained at the same rate for many days or even weeks to come.

But under the careful guidance of a trained instructor who was there to point out his errors as each part progressed, he was able in the third hour to increase his production to 10 parts and at the same time decrease his salvage to 3. The record of the third hour was maintained during the fourth and fifth, yet his salvage decreased to 2 parts.

The beginning of the second day found him turning out 7 times greater net production than at the start of his first day. And though his salvage fluctuated with his production during this day, his last hour's work showed a greater net production than at any previous time. On the third day his first hour's production was 12 parts with a minimum salvage of 1, the end of the second hour he had raised his production to 13 and entirely eliminated his salvage. By night of the third day's work he had reached a high level of production, viz., 14, with no salvages against him.

The cold facts disclosed in these outline charts show conclusively what can be accomplished by training unskilled and inexperienced workers. The Training and Dilution Service offers the assistance of its experts who will be glad to consult with manufacturers regarding standardized training methods.

## Reconstruction Body Under Consideration

(Continued from page 848)

uted where they will do the most good. It is stated that war orders will not be cancelled in a wholesale way until some such plan is developed.

So much for the national phase of the matter. Local manufacturers in various population centers are on the anxious seat. This week in New York a conference of employers, representing 2,000,000 war workers, was held to consider means of transferring labor from war work to peace work without any considerable break in the earning time of the individual.

Plans were considered for switching labor from war work to peace work as rapidly as war industries reduce their working forces. In consequence of the meeting a committee was appointed, with a representative for each industry. This committee will present to the United States Employment Service, from time to time, the actual needs of employers of labor. In this way this government bureau will operate in the most effective manner as a clearing house. The bureau is sending out a questionnaire to manufacturers with the idea of obtaining accurate data on labor requirements and with the idea that such requirements may be filled by releasing war workers for industries connected with more peaceable purposes.

The National Association of Manufacturers has taken a step which should go far to relieve worry on the part of returning soldiers. President Stephen C. Mason has announced that all returned soldiers will have their jobs restored to them in all factories of members of the association. The announcement is to be cabled to General Pershing. It is the plan to have an open door for a return to duty and prosperity for every American soldier and sailor.

The policy of the Government with regard to the release of labor is made plain by its action in gradually closing down the gas defense plant of the United States Government in Long Island City. Here there are 12,000 men and women employed. Following a conference yesterday, notices were posted of a gradual reduction of the working force instead of a wholesale discharge, and government agencies are actively engaged in finding positions for workers as rapidly as they are released.

The question of wages is one of paramount importance. It is suggested that with the cessation of hostilities the needs of war will no longer supply work nor determine the labor relationship. In view of these facts it is thought impossible that the present 8-hour day will survive, or that the era of high wages will continue very much longer.

The sentiment is that the gains obtained by organized labor must be gradually relinquished and that a return to pre-war conditions, both insofar as concerns the hours of work and the wage scale, will follow as a matter of course. It is the opinion of William H. Barr,

President of the National Founders Association, that "the present determination on the part of certain forces among the workers to cling to all that organized labor has gained on an unsound basis during an abnormal and artificial period will doubtless occasion considerable trouble and friction."

But, regardless of whatever machinery may be created to supervise the transition, it is considered certain in official circles that the Government will maintain a centralized control and exercise a very positive supervision over business interests during the change.

### Consider Steel Situation

WASHINGTON, Nov. 13—Conferences are being held here between the War Industries Board and the American Iron and Steel Institute Committee, headed by E. H. Gary to determine what steel can be allocated to non-war industries. No definite decisions were arrived at other than that the War Industries Board will continue to control the allocation of steel for the time being. Data are being gathered and further meetings will then be held to determine how soon Government control of steel can be abolished.

Arrangements have been made to provide the additional steel required by these non-war industries following the modification of the curtailments but no announcement of how this will be accomplished has been made or will be given out at this time.

Arrangements have been made by the War Department to care for those contractors whose contracts have no termination clauses and whose war-work will probably be cancelled. In each instance the contractor will be asked to sell the raw materials on hand and their cost plus handling charges plus overhead directly applicable; the partly finished products on hand and their cost of raw material and labor plus overhead directly applicable, finished products on hand and the contract price less freight charges if contract specifies delivery at point other than factory; special facilities including their cost as paid for and their cost as estimated in the contractors original estimate.

The fair value at the time the contract is terminated will be deducted from the original cost and the contractor is asked to thus determine the ratio of the uncompleted portion of the whole contract; the contractor will also determine the costs of commitments to suppliers and subcontractors in the same manner as in the above rules.

If the contractor claims additional compensation he is to include it with the original claim with detailed facts. If a contract is cancelled the Government official loses his power to enter into a supplemental contract with the contractor.

No allowances will be made for prospective profits but an allowance may be had of 10 per cent of the cost on partly finished products. All materials partly finished products and finished products become the property of the Government if an agreement is reached.

## Washington S. A. E. Section Formed

(Continued from page 848)

Rear Admiral G. W. Taylor, Chief of Construction, U. S. Navy, told of airplane development in the Navy, praising the Liberty engine highly, and said that if it had been a failure the entire Navy program would have failed. The Navy now patrols more than 100,000 miles of coast by airplane weekly and is using single, twin and triple-engine planes and lighter than air dirigibles equipped with single and double engines. The dirigibles make 60 m.p.h. The Curtiss Engineering Co., said the Admiral, has lately developed a seaplane engine that has developed 160 m.p.h. The seaplanes using triple engines are as large as the Handley-Page airplanes.

The Admiral was very enthusiastic over the development of a Washington section and certain it would accomplish much good. Lt.-Col. Edward Orton Junior spoke for the Motor Transport Corps, praising the standardized truck developed by the Society of Automotive Engineers and designed, produced, assembled and operated within 75 days, and which he said was the best truck ever built. He said the Government had already had great benefits from the S. A. E. and would certainly receive additional valuable aid if a section were established. Rear Admiral C. W. Dicer, Chief of the Bureau of Steam Engineering, in charge of engines, told that the Navy uses the Curtiss Liberty, and Hispano-Suiza engines in its program, and that in 2 years the engines have improved from 90 m.p.h. to 160 m.p.h. He stated that the Eagle boats have been made noiseless by use of new drives that eliminate vibration, noisy gears, and at 18 knots keep the engine room silent, which is necessary, as these boats were designed to listen while running and to attack submerged submarines.

Lt.-Col. W. G. Wall, Ordnance Department, formerly National chief engineer, displayed photographs and motion pictures to illustrate the work of the Ordnance Department and showed trench mortar hauling trucks, reconnaissance cars, field gun trailers, caterpillar trailers for carrying ammunition, 10-ton tractors to haul large guns with drawbar pull of 10,000 lb. and speed of 6 m.p.h.; 5-ton tractor with drawbar pull of 6000 lb. and speed of 10 m.p.h.; 3-ton tank equipped with two Ford engines, of which many have been made; 6-ton tank similar to the French Renault tested on 100 per cent grade, stopped halfway and started again, and capable of going most anywhere.

He told how the American Army learned to use tractors not only to haul guns but to carry them and shoot them while on tractors. This, he said, made it difficult for the enemy to get the range as the guns could be moved easily and quickly, and further this eliminated the need for digging the gun into the ground, the usual camouflage and the carrying away of dirt to prevent enemy airplanes finding the guns.

Ward M. Canaday, advertising manager of the Willys-Overland Co., Toledo, Ohio, is giving part of his time at Washington directing the public information work of the Non-War Construction Division of the War Industries Board, headed by D. R. McLennan of Chicago.

Earl L. Woods, sales manager of the tractor department of the J. I. Case Plow Co., Racine, Wis., has accepted a commission as a captain in the Motor Transport Corps and will go overseas shortly with Unit 304, to which he reported for duty at Ft. Sam Houston, Tex., on Nov. 10.

Albert Gough is now in charge of the service department of the Liberty Motor Car Co., Detroit. He was formerly connected with the Shaw Electric Crane Co., Muskegon, where he was engaged in production work, and more recently with the service organization of the Chalmers company.

James W. Graham, member of the C. A. S. Engineering Co., Columbus, Ohio, the steering gear manufacturing company of the parent organization in Detroit, died at Columbus of influenza. He was purchasing agent of the old Krit company.

Howard West, purchasing agent for factory supplies at Dodge Brothers, Detroit, died of Spanish influenza at his home in Royal Oak, Nov. 2.

Walter E. Parker, president of the Commerce Motor Car Co., Detroit, has entered the service in the capacity of captain in the Quartermaster's Corps, and is chief of the motor transport division in Indiana and Michigan.

#### Mott Completes Organization

DETROIT, Nov. 8—Major C. S. Mott, head of the Weston-Mott Co., Flint, and in charge of the inspection and production branch, Motors and Vehicle Division, Quartermaster Corps, this district, has completed his staff organization. Among the members of his staff are Lieutenant Harold Whitmore, former production superintendent of the Dort Motor Car Co., Flint, in charge of Class AA truck production; Charles H. Quirk, production manager for the Buick Motor Co. and later with the Cadillac company on Liberty engines, who will have charge of the quad and four-wheel drive section.

Earnest Kollmorgan, former superintendent of the W. A. Paterson Co., Flint, will have charge of the production of Ford, Dodge, Cadillac and Packard cars for the Army; Harold Comlossy, of Mac-Crone & Co., accessory dealer in Chicago, to have charge of spare parts; Lieutenant Neil J. Bersten, formerly with the Weston-Mott Co., Flint, to have charge of the Continental Motors and Hinkley Motors Co. production of engines; Lieutenant Lloyd Kenworthy, formerly with the Weston-Mott Co., to have charge of production of Timken axles; Lieutenant Vance Day, formerly with the General

## Men of the Industry

### *Changes in Personnel and Position*

#### James W. Graham

COLUMBUS, OHIO, Nov. 11—James W. Graham, president of the C. A. S. Products Co., manufacturer of auto gears and other parts and accessories, died at his late residence last week from an attack of influenza. He was 29 years of age and reorganized the present company from the old Foster Gear Co. about three years ago. His former home was at Carthage, Canada.

Motors Truck Co., to have charge of production of trailers.

Harvey J. Mallery, formerly with the Weston-Mott Co., will have charge of accounting; A. P. Brush, Brush Engineering Association, Detroit, production engineer of the motors branch; Herbert White, formerly with the Hyatt Roller Bearing Co., Detroit office, appointed assistant to Major C. S. Mott; Captain W. B. Deyo, former Ford dealer, member of the production department of the motors division; Benjamin Rosenszweig, former purchasing agent of the Buick Motor Co., Flint, to have charge of priorities; F. H. Mutchler, accountant, to have charge of statistics.

Lieutenant E. C. Welch, Port Huron, will have charge of production of Class B trucks; R. E. Winans, assistant in charge of production of Class B trucks; Bernard McKay and Henry Hellman, both with the Ford Motor Co., assistants to E. C. Welch; F. P. McDevitt, also assistant to E. C. Welch; Arthur Hayes, formerly with the Ford Motor Co., gray iron specialist; Lieutenant W. O. Lamke, assistant in charge of priorities; Lieutenant R. P. Kenney, assistant to E. C. Welch; H. Coen, formerly of the Ford Motor Co., assistant in charge of the production of quad and four-wheel trucks.

J. F. Gilmore will be assistant in charge of spare parts; C. A. Bundy, assistant in charge of spare parts and located at the plant of the Packard company; H. P. Glazier, assistant, same duties, assigned to the plants of the Ford and Cadillac companies; W. W. Carpenter, assistant, in like capacity, assigned to the Dodge plant; L. F. Mullen, Detroit, assistant, same duties, and John F. Thompson, Federal motor truck distributor, Detroit, in charge of body division.

Major George D. Wilcox, former sales manager of the Commerce Motor Car Co., Detroit, is Detroit district manager of the motors branch, and Norval A. Hawkins, sales manager of the Ford Motor Co., his assistant. Captain W. E. Parker, president of the Commerce Motor Car Co., Detroit, is traffic chief of the division, covering Michigan and Indiana.

Guy Nonemacher, formerly secretary to President Walter P. Chrysler, of the Buick Motor Co., Flint, who has been color sergeant with the 125th Infantry in France, has been promoted to second lieutenant.

L. E. Trent has been appointed secretary and general manager of the Common Sense Gas Tractor Co., Minneapolis. He succeeds H. W. Adams.

E. L. Evans has been appointed superintendent of Plant 1 of the Bound Brook Oil-Leas Bearing Co., Bound Brook, N. J. He was formerly chief inspector of the plant.

#### Western Trailer Adds to Personnel

KANSAS CITY, Nov. 11—The Western Trailer Co., organized in April, 1918, has for the third time increased its factory, the latest addition being 50 x 175, two stories. The body factory, paint shop and other enterprises will occupy the older portions of the building, about twice the size of the new. The company has recently engaged H. M. Gillespie, formerly district sales manager of the Republic Motor Truck Co., with headquarters in New York, as assistant to the president and director of sales. Mr. Gillespie was also formerly connected with the White Co., and was assistant manager of the Racine Saddlery Co. H. G. Fluority, for several years chief engineer of steel mills in the Pittsburgh and Birmingham districts, has been engaged as chief engineer of the Western Trailer Co., and is now completing designs for trailers which the company manufactures, from one-half to twelve tons capacity. Peter Nelson, formerly in charge of body building departments for passenger car and truck manufacturers, including Packard, Nash, Mack and General Motors, has been employed as superintendent of the body building department; he will specialize in bodies of intricate design with which the trailers will be equipped. C. J. Welch is president and general manager of the Western Trailer Co.

#### Government to Retain Control of Steel Prices

WASHINGTON, Nov. 13—In accordance with the expressed wishes of steel producers at the first Reconstruction Conference of the War Industries Board held to-day, the Government will continue for the time being the regulation of the sale and distribution of steel.

It was felt that this course was desirable in order to insure against the possibility of disturbance to the steel industry or to other industries in which steel plays an important part. An informal statement was issued jointly after the meeting of the chairmen of the War Industries Board and of the American Iron and Steel Institute. This was to the effect that the general discussion had the main purpose of preserving industrial stability, and that it was characterized by a spirit of co-operation and that further data and information would be collected for the use of further conferences.

## New Quartermaster Contracts

WASHINGTON, Nov. 11—The following contracts were placed by the Quartermaster Board of Review:

United States Rubber Co., Dallas, raincoats, \$6,761.63.  
United States Rubber Co., Boston, raincoats, \$5,826.09.  
Firestone Tire & Rubber Co., Akron, tubes and casings, \$14,028.14.  
Firestone Tire & Rubber Co., Akron, tubes and casings, \$6,970.40.  
B. F. Goodrich Co., Akron, tubes, \$6,112.75.  
B. F. Goodrich Co., Akron, tubes and casings, \$11,327.04.  
United Equipment Corp., New York, tool bags, \$5,900.  
White Co., Cleveland, wheels, etc., \$35,781.60.  
Berg Auto Truck & Specialty Co., New York, shoeing boxes, \$12,035.  
U. S. Rubber Co., Baltimore, raincoats, \$7,084.75.  
B. F. Goodrich Rubber Co., Akron, tires, \$6,203.75.  
H. S. Tire & Rubber Co., New York, casings, \$13,041.50.  
B. F. Goodrich Co., Akron, casings, \$14,483.  
Dort Motor Car Co., Flint, cargo bodies and troop seats, \$182,500.  
Field Mfg. Co., Owosso, Mich., cargo bodies and troop seats, \$71,500.  
International Harvester Co., Chicago, cargo bodies and troop seats, \$286,000.  
Auto Body Co., Lansing, cargo bodies and troop seats, \$341,250.  
Belber Trunk Co., Philadelphia, tool bags, \$46,104.96.

## Indian Service Wants Cars

WASHINGTON, Nov. 7—Bids are asked for three 5-passenger touring cars to be delivered by December 1, by the United States Indian Service, Department of the Interior, Yakima Agency, Fort Simcoe, Washington. Bids are to be filed by November 20 and the bidder should state the make of the automobile he proposes to furnish and also quote the price f.o.b. White Swan, Washington on the Northern Pacific Railroad.

## Ordnance Department Contracts

WASHINGTON, Nov. 4—The following contracts and purchases were made by the Ordnance Department:

Vim Motor Co., Sandusky, lifting plugs.  
Maxwell Motor Co., Detroit, tools and accessories.  
Cleveland Tractor Co., Cleveland, tractors.  
Four-Wheel Drive Auto Co., Clintonville, parts.  
Detroit Auto Specialty Co., Detroit, fuse socket holders.  
Edw. G. Rudd Mfg. Co., Philadelphia, airplane release mechanism, bomb release mechanism, crates.  
Nash Motors Co., Kenosha, truck repair parts.  
B. F. Goodrich Rubber Co., Akron, rubber hose.  
Allen Motor Co., Fostoria, safety bolts and gun spare parts.  
Billings & Spencer Co., Hartford, wrenches.  
Pan Motor Co., St. Cloud, drop forgings.  
Keystone Forging Co., Northumberland, Pa., drop forgings.  
Nash Motors Co., Kenosha, automobiles.  
Willard Storage Battery Co., Cleveland, batteries.  
Panson Lumber & Mfg. Co., Bridgewater, Nova Scotia, spruce.  
Charles T. White & Son, Sussex, New Brunswick, spruce.  
Fellows & Co., Boston, spruce.  
Lake Niegantic Pulp Co., Lake Niegantic, Quebec, Canada; spruce.  
American Commercial Car Co., Detroit, motor trucks.  
Cadillac Motor Car Co., Detroit, ambulances.  
Ford Motor Co., Detroit, ambulances.  
Wright-Martin Corp., New Brunswick, services.  
Wright-Martin Corp., New Brunswick, labor.  
Ward Motor Vehicle Co., Philadelphia, trench searchlights.

## Contracts

## General Engineer Contracts

WASHINGTON, Nov. 4—The following contracts were made by the General Engineer Depot:  
Ford Motor Co., Detroit, wheels.

## Marine Corps Contracts

WASHINGTON, Nov. 4—The following contracts have been placed by the Marine Corps:  
Nash Motors Co., Kenosha, spare parts for trucks.

## Aircraft Production Purchases

WASHINGTON, Nov. 4—Following is a list of purchases made by the Aircraft Production Board:

2250-2. Wright-Martin Aircraft Corp., New Brunswick, engine spares.  
International Stamping Co., Detroit, spares for planes.  
The Bristol Co., Waterbury, Venturi Pitot tubes.  
Curtiss Aeroplane & Motor Co., Buffalo, spares for planes.  
Willys-Overland Co., Toledo, motors and spares.  
Curtiss Aeroplane & Motor Corp., Buffalo, engine spares.  
Curtiss Aeroplane & Motor Corp., Buffalo, spares for planes.  
Capital Electric Co., Washington, D. C., material for mobile electric plants.  
Standard Seamless Tube Co., Ambridge, Pa., tubing.  
Tillotson Mfg. Co., Toledo, O., carbureters.  
Curtiss Aeroplane & Motor Corp., Buffalo, planes.  
Curtiss Aeroplane & Motor Corp., Buffalo, engine spares.  
Wright-Martin Aircraft Corp., New Brunswick, tools for engines.  
Wright-Martin Aircraft Corp., New Brunswick, engine spares.  
Standard Parts Co., Cleveland, Ohio, tubing.  
Standard Varnish Works, 90 West Street, New York, for mixing of dope.  
Standard Aero Corp. of New York, Elizabeth, N. J., planes.  
The Steel Products Co., Cleveland, Ohio, engine spares.  
Curtiss Aeroplane & Motor Corp., Buffalo, engine spares.

## New Milwaukee Ford Home

MILWAUKEE, Nov. 11—The Milwaukee branch of the Ford Motor Co., which turned over its big assembling plant to the Government for hospital purposes on Nov. 1, has taken over the three-story building of the Hughes Motor Car Co. for the period of the war and one year thereafter.

## Calendar

## ENGINEERING

Nov. 14-15—New York, Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

## SHOWS

Nov. 11-16—Phoenix, Ariz. Tractor demonstration, State Fair.  
Nov. 11-16—Pittsburgh, Pa. Fall Automobile Show, Motor Square Garden. Automobile Association of Pittsburgh.  
Jan. 13-19—Des Moines, Ia. First Tractor Show, Des Moines Thresher & Tractor Club. H. J. Clark, Mgr.

## Aircraft Production Contracts

WASHINGTON, Nov. 8—Following is a list of contracts placed by the Bureau of Aircraft Production:

General Motors Corp., Detroit, motors.  
Dartmouth Mfg. Co., New Bedford, Mass., airplane fabric.  
William Whitman & Co., New Bedford, Mass., airplane fabric.  
American Bleached Goods Co., Taftville, Conn., airplane fabric.  
Harding, Tilton & Co., New Bedford, Mass., airplane fabric.  
Harding, Tilton & Co., New Bedford, Mass., airplane fabric.  
Unit Construction Co., Philadelphia, Pa., propellers.  
Marlin-Rockwell Corp., New York, spares for planes.  
Hardman, Peck & Co., New York, propellers.  
The Holbrook Co., New York, propellers.  
Packard Piano Co., Fort Wayne, Ind., propellers.  
The Unit Construction Co., Philadelphia, Pa., generator propellers.  
Intertype Corp., Brooklyn, N. Y., interrupter gears.  
Wolverine Brass Works, Grand Rapids, Mich., interrupter gears.  
Wright-Martin Aircraft Corp., New Brunswick, engine spares.  
Holt Mfg. Co., Peoria, Ill., adapter sets.  
Thomas-Morse Aircraft Corp., Ithaca, spares for planes.  
Thomas-Morse Aircraft Corp., Ithaca, spares for planes.  
Hardman, Peck & Co., New York, lamination sets.  
Curtiss Aeroplane & Motor Corp., Buffalo, spares for planes.  
Curtiss Aeroplane & Motor Corp., Buffalo, airplanes.  
Thomas-Morse Aircraft Corp., Ithaca, spares for planes.  
Olds Motor Co., Lansing, Mich., engine spares.  
Spitdorf Electrical Co., Newark, engine spares.

## Beaver Kerosene Tractor Engines

(Continued from page 839)

the crankpin bearings. Each of the connecting-rod heads is provided with a splash scoop which dips into an oil trough beneath the crank, and splashes oil all over the interior surface of the crankcase and on to the cylinder wall. Oil holes are provided on top of all bearings through which oil from the splash can find its way to the bearing surfaces.

For circulating the cooling water there is provided a centrifugal pump with 5 in. impeller. This pump runs at crankshaft speed and tests have shown that at 900 r.p.m., at which speed the engine is governed, it delivers about 190 lb. of water per minute against a head of 1½ ft. A 20-in. fan is usually employed with these engines and is driven by a 1½ in. flat belt from the accessories shaft.

The weight of either size of engine is in the neighborhood of 1000 lb. A governor is always fitted. In the past various makes of governors have been used by different customers, but the company is now developing one of its own design.

## Kansas City Wants Fire Trucks

KANSAS CITY, Nov. 11—As the result of the adoption of prefects for issuing bonds in Kansas City, Mo., at the election Nov. 5, the city will shortly be in the market for more than \$100,000 worth of fire department motor equipment, and may within a year be buying motor equipment for the delivery of ice from a municipal plant. One bond issue is for \$200,000 to buy fire department equipment, the purpose being to replace nearly all the present vehicles.

## Order **Now** For Big Winter Trade

Engineering  
Library  
GENERAL LIBRARY  
DEC-2 1918  
UNIV. OF MICH.

Dealers are looking to their jobbers to take care of the big winter demand for Champion Priming Plugs.

They sure-fire cold motors because you have gas right at the sparking points of the spark plugs.

The gasoline trickles right down the core and drips from the electrode—right where the spark jumps.

Don't take out your plugs—don't run down your battery or

wear yourself out with useless cranking.

Champion Priming Plugs are imperative in cold weather for the hundreds of thousands of cars that do *not* have priming cups, and are infinitely better for those that do, because priming cups let the gas in *too far* from the spark plug.

Because of the public demand for the Sure-Fire of Champion Priming Plugs, *get your order in early* so you will not miss a single sale.

## Don't Wait!

Don't wait until the freezing weather comes to think about protecting your car for the coming winter. Decide early to use Johnson's Freeze-Proof—purchase your supply from your dealer and read the directions carefully. A little time spent now in cleaning the radiator and putting on new hose connections will save you unlimited time, trouble, worry and expense during the winter months.

## JOHNSON'S FREEZE-PROOF

is the logical anti-freeze preparation to use. It is inexpensive—does not evaporate—is non-inflammable—is easy to use—and is guaranteed. One application will last all winter unless the solution is lost through the overflow pipe or leakage.

One package will protect a Ford to 5° below zero, one and a half packages will protect a Ford to 30° below zero and two packages will protect a Ford to 50° below zero. For larger cars, or to protect to a lower temperature, use additional Freeze-proof according to the scale on the package.

For Sale by all Dealers and Jobbers

S. C. JOHNSON & SON, Dept. A, Racine, Wis.

We used your Freeze-Proof for the last two winters in all of our cars, meaning seven passenger cars and one truck. We found same to be a very good anti-freeze solution, and also a very inexpensive, effective substitute for alcohol. We can recommend it very highly for the purpose it is intended for.—F. M. OPITZ, Pres. Perflex Radiator Co., Racine, Wis.

We wish to say at this writing, we want to compliment your company for the wonderful co-operation that we have had towards the sale of Freeze-Proof this past season. We haven't a package of Freeze-Proof left in stock and sold same to owners of cars where the prices of these cars carried from \$1,000.00 to \$15,000.00 and not in one instance did we have a complaint for this product.—JOHN J. MAHONEY, Treas. Motor Accessories, Inc., Boston, Mass.

Our confidence in Freeze-Proof is such that we have just placed an order for an additional carload for the coming season, and quite naturally we could not have the nerve to handle this quantity if we did not have the most profound confidence in the product.—THE SALT LAKE HDWE. CO., Salt Lake City, Utah.

We have used Johnson's Freeze-Proof this winter in Peenless Eight, Chandler Six, Ford, Wilson and Republic Trucks. This has been the coldest winter we have had for years, zero and lower right along. But notwithstanding the extremely cold weather all of the above cars and trucks have worked every day and not one of them froze up. We consider your preparation the best we ever used.—JOHN T. BYERS Supt. Labor Brewing Co., Uniontown, Pa.

We wish to say that the Freeze-Proof is satisfactory in every respect. We have recently had temperature of 20 below zero and it did not freeze in my car at that time.—W. J. DYSART, Woods-Everts Store Co., Springfield, Mo.

We used several cases of your Freeze-Proof last winter and the very best of results were obtained from its use. It was satisfactory enough that we are stocking it again this coming season.—CITY GARAGE OF TYLER, Tyler, Texas.

In regard to your Freeze-Proof, beg to say that when it has been used according to directions I have had the very best success. When the proper amount is used even in the most severe weather I have not had a single complaint of cars freezing.—W. S. DOUGHTY GARAGE, Parker, S. D.

We have used your Freeze-Proof for the past year and it gave entire satisfaction and placed our order for the coming season.—MADISON MOTOR CO., Madison, Maine.

I put your Freeze-Proof in my radiator and have had satisfactory results. I had it in the radiator while the thermometer registered 22 below zero. No injury was done. I shall be your patron henceforth.—REV. F. ADI X, Rush Center, Kans.

I have used Johnson's Freeze-Proof during the winter 1917-18 and can recommend it to all car owners. It was tested in my car by 20 below zero. For that reason I dare to recommend it.—REV. H. NIELSEN, Poysippi, Wis.

Johnson's Freeze-Proof has done good work for me this winter. My car has been out all night several times in a howling gale at from 10 to 16 below zero and my radiator did not freeze.—DR. MALCOLM DEAN MILLER, Akron, Ohio.

I used your Freeze-Proof this past winter, and as you will recall, it was the worst weather we have had in many years. It protected my seven passenger car to as far as 20 degrees below zero and did not show the least particles of crystals in the radiator. Johnson's Freeze-Proof is the best insurance one can have on the cooling system of any car.—C. W. MALLORY, Georgetown, Ky.

Have used your Freeze-Proof and find it all that you advise it. Will probably always use it unless I find something better which I doubt I ever will.—H. H. PECK, New Milford, Conn.

I have used Johnson's Freeze-Proof in my Overland Six which is a regular type Continental motor. Although this was a very severe winter Johnson's Freeze-Proof stood the test.—H. E. GNADT, General Hardware, Chicago, Ill.

## Co-operation in Conversion Assured

**Resumption of Peace Basis in Automotive Industry to Be Facilitated—Makers  
and Government Representatives Confer on Transition Problems—  
Cancellation of Contracts to Be Gradual—Disposition  
of Army Trucks Considered**

**W**ASHINGTON, Nov. 19.—Conditions affecting the automotive industry here gradually are taking definite shape, and, following the meeting of the National Automobile Chamber of Commerce members yesterday, assurances are coming to light of a gradual resumption of peace-time occupations without that jolt which some expected and which might have proven disastrous. Further evidences are everywhere apparent that the Government contemplates full and complete co-operation with industry with a view to fostering and furthering a quick return to commercial practice.

### **Great Care is Urged**

The urgency for great care by the Government in its policy with regard to the cancellation of contracts, the serious possibilities of labor troubles, and the fact that commencing to-day all Government priorities except for Army and Navy work are void, thus permitting manufacturers to purchase what supplies they need in the open market are all questions which are in the air; and already answers partly satisfactory and almost wholly reassuring have been forthcoming.

The reconstruction of industry, or rather its transition, from a war to a peace basis is the topic of paramount importance at present. Just how this policy is to be shaped with a view to the fullest possible co-operation, is indicated by the formation of a committee of members of the N. A. C. C. chosen at

the invitation of Chairman Bernard M. Baruch of the War Industries Board, to meet with him and give him aid in such work.

The committee includes Hugh Chalmers, Alvan MacCauley, of the Packard Motor Car Co.; H. B. Jewett of the Paige-Detroit Motor Car Co.; Roy D. Chapin of the Hudson Motor Car Co.; and Charles Clifton of the Pierce-Arrow Motor Car Co., representing passenger car makers; and George Graham of the Pierce-Arrow Motor Car Co.; Windsor White of the White Co.; L. H. Boylston of the Service Motor Truck Co.; S. M. Williams of the Garford Motor Truck Co., and A. C. Burch of the Clydesdale Truck Co. for the truck makers.

### **Delay in Conversion Unavoidable**

Following a preliminary meeting, this committee drew up a formal statement which was presented to Mr. Baruch but not made public. The statement pointed out present conditions and emphasized the fact that following the advice of the War Industries Board, a great many of the members of the N. A. C. C., had arranged their businesses so that they were practically 100 per cent on war work and that months of delay must be faced in converting their activities to a peace basis.

It was also pointed out that unless great care is taken in the cancellation of contracts, large numbers of workers will have to be laid off summarily; on the other hand, if such cancellations are con-

servatively arranged, and the elimination of war business fitted into the gradual resumption of peace business, coupled with a removal of all curtailment restrictions, manufacturers believe they can get back to normal production safely and without serious disturbance.

That the Government will welcome the assistance of the automobile makers and will tender every aid to bring a safe return of peace time activities is made certain by the statements already made by Mr. Baruch and other officials.

### Government Anxious to Co-operate

The Government is exceedingly anxious to cancel contracts and demobilize the Army to effect savings in expenditures but it appears to realize that moderation in action is necessary. The prompt action taken last week by the War Industries Board modifying curtailments was the first step in acknowledgment that industry must be guarded and that room must be made for the workers before they are discharged from the Army.

Contracts are being canceled or suspended according to a definite plan by which only those orders not yet in production are cut or terminated. Airplane contracts have in the main been suspended instead of canceled where they were not in production pending decision by Secretary Baker and General Pershing as to the needs abroad and the possible future of military planes.

The contracts suspended were those not yet in production. For example the Fisher Body Co., which is in production on De Haviland planes and has just completed the drawings for the Caproni, continue producing De Havilands at a somewhat reduced rate but has entirely suspended the Caproni program. Likewise the Curtiss Aeroplane & Mfg. Co. has suspended its work on the Liberty engine program but continues its output of Liberty engine parts for other makers, and its other contracts. Liberty engine production has not been terminated in any factory as yet where the plant is actually engaged in turning them out.

### Truck Contracts Cancelled

Although the cancellations of motor trucks and other vehicles seem large—81,000 to date—these comprise entirely trucks that have not yet been in production and in some instances merely the truck orders planned soon and not yet even placed.

The cancellations include: The recent contracts placed for 25,000 "B" 3-ton standardized trucks together with the eleven major units which were also ordered, the axles, motors, wheels, steering gears, transmission, clutches, universal joints, tires, radiators, frames and springs.

Fifty per cent of all the commercial trucks on order and not yet delivered were canceled including:

Name of company	Original Order	Type	Reduced to
Federal Motor Truck Co. ....	500	3½-ton	250
Federal Motor Truck Co. ....	300	5-ton	150
Gramm-Bernstein Co. ....	100	3½-ton	50
Hurlburt Motor Truck Co. ....	200	5-ton	100
International Harvester Co. ....	200	2-ton	100

Name of company	Original Order	Type	Reduced to
International Harvester Co. ....	800	2-ton	400
Kelly-Springfield Truck Co. ....	920	3-ton	460
Moreland Motor Truck Co. ....	40	2½-ton	21
Moreland Motor Truck Co. ....	60	4-ton	30
Packard Motor Co. ....	3000	3-ton	1500
Peerless Motor Car Co. ....	500	3-ton	250
Republic Motor Truck Co. ....	250	5-ton	125
Standard Motor Truck Co. ....	800	3½-ton	150
Vellie Motor Vehicle Co. ....	125	3-ton	63

Other cancellations included the Kelly-Springfield Motor Truck Co. order for 340 1½-ton "A" trucks which has been reduced to 170, the Pierce-Arrow Motor Car Co. order for 1100 2-ton "A" trucks reduced to 700, and the J. C. Wilson Co. contract for 200 2-ton "A" trucks cut to 100. The Peerless Motor Co. order for 3000 "A" trucks and the Garford Motor Truck Co. order for 4000 "A" trucks have been suspended. Orders for Nash and F-W-D trucks have been reduced by 15,000.

### Urge Gradual Cancellation

In discussion of these cancellations the various manufacturers pointed out the disaster that would follow too prompt termination. That 6000 trucks out of the order for 8000 "A" trucks placed with the White Co. had been cancelled while 1000 had been delivered and the other 1000 is in production was the statement by Windsor White. He told that it will require three months before the company can get back to a normal peace basis which means that Government work must be maintained in the plant for that length of time or the organization must be reduced.

The Peerless Motor Truck Co., which suffered the termination of its contract for "A" trucks has an order for 500 Peerless trucks for the British Government which will suffice to keep the company going while it undergoes conversion to a peace basis, if it is not cancelled. The Mitchell and Kissell companies reported serious labor troubles in Wisconsin due to the socialistic trend there.

Mitchell has 2000 trucks completed for the Government and 2000 in production. The Kissell order for 2400 was cut to 900 which will be sufficient if no further cuts are made. The U. S. Motor Truck Co., which held an order for 2000 trucks has been reduced to 500 trucks and unless the Government continues its business with the company until it can convert to a peace basis it too will have to lay off men. In fact, every manufacturer told of the same experiences, of need by the Government to maintain some of its war contracts and to be conservative in their termination.

That the Government may possibly allow truck makers to retain materials purchased for war contracts for use in making commercial trucks is possible.

The possibilities of further need for Army trucks was also discussed at the N. A. C. C. meeting and it was said that the policing of Europe will make a demand for trucks for many months to come. To prove the need for them it was cited that 10,000

German trucks had been placed at the disposal of the American Expeditionary Forces because our Army abroad suffered from a truck shortage.

A possible continuation of the past differences between the adherents and opponents of the Class B standardized Army trucks, also known as the Liberty truck, was forecast by the announcement that the Class B assemblers following a meeting in Ohio this week asked the co-operation of N. A. C. C. members and were told to appear before General Drake and the War Industries Board as a separate body. The formation of a motor truck committee by the N. A. C. C. with three members in favor of the elimination of the B truck and two in favor of its retention also gives promise of interesting activities between the majority and minority sections.

Other important developments included the statement that all manufacturers' pledges made to the War Industries Board will stand until January 1, 1919, which means that truck manufacturers can make trucks only to the number allotted them by the War Industries Board, despite the statement made last week by the Automotive Products Section of the Board to the effect that truck makers could consider themselves on a 100 per cent production basis.

It was also told that makers need fear no competition from re-sale of trucks now in the Army because those in France would be sold abroad while those in this country will be useless from wear and those that can be used will be taken over by the Post Office.

A committee was appointed to wait upon General Drake, Motor Transport Corps, to impress the dangers of reselling the trucks to the public and to learn definitely from him if the plans stated above are the Government's program.

That the Government will take the necessary steps with regard to labor seems assured by the arrangement made to-day between the War Department,

War Industries Board and U. S. Employment Service. The Service will place all workers released by cancellation of contracts. It will make surveys and if employment is not available will recommend to the War Board that the contracts in question and which would release workers should be continued and not terminated. Its recommendations will be followed.

That the Service can effect good work it has already shown by its disposition of the labor problems during the war and it has already placed large bodies released from war work since the signing of the armistice. Seventeen hundred workers discharged from a Dayton airplane factory last week not only found new employment through the Service but were distributed from the gates of the old employer to the new jobs.

Further evidence of the Government's policy and plans are indicated in the statement by Assistant Secretary of War Benedict Crowell who said:

"Instructions have been issued to all bureaus of the War Department governing the methods of slowing down production so that there will be a tapering off of war work giving time for industrial readjustment. So that manufacturers might as rapidly as possible get into work of civilian needs the War Industries Board has at our request withdrawn all priority ratings on Army work. Over-time, holiday and Sunday work has stopped and as rapidly as the labor can be used in normal day shifts, night shifts will be discontinued."

Resolutions were adopted at the meeting, giving thanks to Hugh Chalmers who has represented the industry in Washington and to C. C. Hanch, vice-president of the Studebaker Corp. and chairman of the Automotive Products Section of the War Industries Board, for their work both for the Government and the industry. A further tender of the services of the National Automobile Chamber of Commerce members to the War Industries Board was also voted.

# Cultivating Japanese Automotive Field

## PART I

### Passenger Car Imports Increasing—Financial Position Excellent—Missionary Work Needed to Overcome Prejudice Against American Products

By Tom O. Jones\*

JAPAN as a whole is prosperous. Individually the Japanese are better off financially than ever before in their history. Some tremendous profits have been made from war business. While applying to many industries, this is especially true in the shipping business and shipbuilding, lines of activity that have been of particular advantage to Yokohama and Kobe, and has resulted in large profits for manufacturers in the Osaka and Tokyo districts. The men who have profited from this business are commonly known as *narikin*, a term almost synonymous with our designation war millionaires. These make up a class of buyers who are willing to spend liberally for pleasures that were heretofore beyond their reach. These men want automobiles and want them badly.

#### 25 Per Cent of Imports Exported

Of the 218 cars imported in 1916 it is safe to say that fully 25 per cent were re-exported, but this fact only emphasizes the increase of business during 1917, for during the first six months of the latter year 216 cars were brought in, equaling the entire previous year's business, with practically no re-shipment to other countries. In the last six months of 1917 three times as many cars were imported as during the first six months, and the total number for the entire year was practically four times that of 1916. Comparative figures for the two years, by months, are given below:

Months	1916		1917	
	Number	Value	Number	Value
January	11	\$5,205	15	\$12,526
February	13	12,685	41	39,565
March	33	21,018	14	12,453
April	10	6,473	54	40,423
May	14	11,570	34	36,690
June	19	19,413	58	49,687
July	13	12,176	128	107,272
August	14	14,943	129	116,684
September	29	32,240	99	95,094
October	18	21,894	50	45,310
November	23	17,244	111	94,987
December	21	17,712	127	130,490
Total	218	\$192,573	860	\$781,181

The late summer months were the periods of greatest import, but this was due more to shipping conditions than to seasonal trade. The figures for 1917, proportionately large as they are, might well have been increased, for a great number of dealers who had ordered cars in America were unable to obtain deliveries.

From the foregoing it might appear that Japan is a country to which the American manufacturer might look for huge business. But the first statements are optimistic only

in comparison with previous conditions in Japan. When it is realized that at the present time there are hardly more than 2700 automobiles in Japan, it is evident that an amount of business which would be considered small in many other countries, or even in one of the states of our country, would be large for the entire Empire of Japan. While the Japanese business is growing steadily, it will not for a long time merit a large outlay, either in advertising or in travelers' expenses. The chief task of the American manufacturer is to see that he gets his fair share of the business.

European manufacturers had nearly half the business in 1912 and more than half in 1913. Since the war, of course, the American manufacturers have had practically all the trade. Most of the European cars imported in 1915 and 1916 were brought in by private owners, although one American company shipped a few direct from the factory. The trend of business under normal conditions shows a decided preference for the European car, and there is hardly a dealer in Japan to-day who does not look forward to the time when he can again secure some of the standard European makes to meet the demands of the trade in high-priced cars.

#### Position of the American Car

There is a prejudice against American cars which should be overcome while the Americans have the market to themselves, but there is a noticeable lack of any great effort along this line. The lower-priced cars are getting the trade and will continue to hold it on a basis of price, unless Europe comes forward with small cars after the war. At any rate, as soon as the war is over the European manufacturers will have a practical monopoly in furnishing the higher-priced vehicles. With increasing shipping difficulties the task of the manufacturer to-day is harder than in the previous two years.

Japanese dealers, of course, are influenced in favor of European cars, as against the higher-priced American machines, by the attitude of their buyers. There is a deep-seated feeling that European workmanship is superior. This may be due in part to the fact that older members of many of the wealthier Japanese families have been educated in Europe. Also, from the standpoint of the dealer, the European contracts are more favorable in their terms. Some of the features in American contracts which do not meet with favor in Japan will be discussed later in this report.

It is evident that there must be some propaganda in favor of American cars, preferably conducted by the manufacturers direct, through the National Automobile Chamber of Commerce. There is no doubt that some of the English papers in Japan would use publicity matter and a part of it might find its way into some Japanese papers.

#### Lack of Good Highways

If favorable influences in Japan at the present time can be put down as an abundance of money among the buying class and the desire to own cars, the unfavorable conditions may be ascribed almost entirely to road conditions in the Em-

\*EDITOR'S NOTE—Mr. Jones was formerly with the J. B. Crockett Co., New York, and was given a special appointment by the Bureau of Foreign and Domestic Commerce to investigate automotive conditions in Japan, China, the Philippines and Hawaii. This story is taken from the advance proof sheets of Mr. Jones' report to his departments. Part II will deal with the making of selling connections, the type of car Japan wants, Japanese repair facilities and shipping regulations, duties, etc.

pire. There has been very little change in the highways of Japan in years, except for certain short stretches built for military purposes. Generally the roads through the country are narrow and winding, hardly wide enough to permit two vehicles as wide as standard motor cars to pass. Moreover, there are usually deep ditches on each side, or the road is considerably raised above the level of the rice fields, so that in passing it is almost necessary for one of the vehicles to stop or risk going into the ditch. That this matter has the attention of the Government is evidenced by the following item in the *Japan Advertiser* of Sept. 27, 1917:

The Government authorities announced yesterday that a bill extending the national road from Tokyo to Yokohama for 20 miles has been approved by the Minister of Finance and placed in the budget which will be submitted at the forthcoming session of the Diet. The bill asks for 3,000,000 yen (1 yen=\$0.498) for the construction of the road and the other half will be borne by the prefectures of Kanagawa and Tokyo. The road, according to the plan, is to be 48 feet wide and will make an ideal one for military motor cars. The authorities said that the road will be completed within three years. On the completion of the road means for motor traffic between the two cities will be greatly improved, and the present possible time for motor cars, about one hour, will be shortened. Both the Tokyo and Kanagawa prefectures have decided to defray a sum of 705,000 yen for the coming fiscal year for the improvement.

How the expense of reconstructing this road will reach such high figures can be judged from the fact that of the 20-mile length probably not more than 5 miles is now of the standard width. Of the remaining distance only 3 or 4 miles is through open country. The rest of the way the desired width can only be obtained by tearing down solid rows of houses and shops that now line either side of the road. Even the widening of this highway will hardly result in clear traveling between the two cities because of the tendency of Japanese vehicles and pedestrians to wander zigzag aimlessly over the road.

Because of the fact that Tokyo is extremely hot during most of the summer, many of the business men live in Yokohama or at some point between the two cities. The building of this

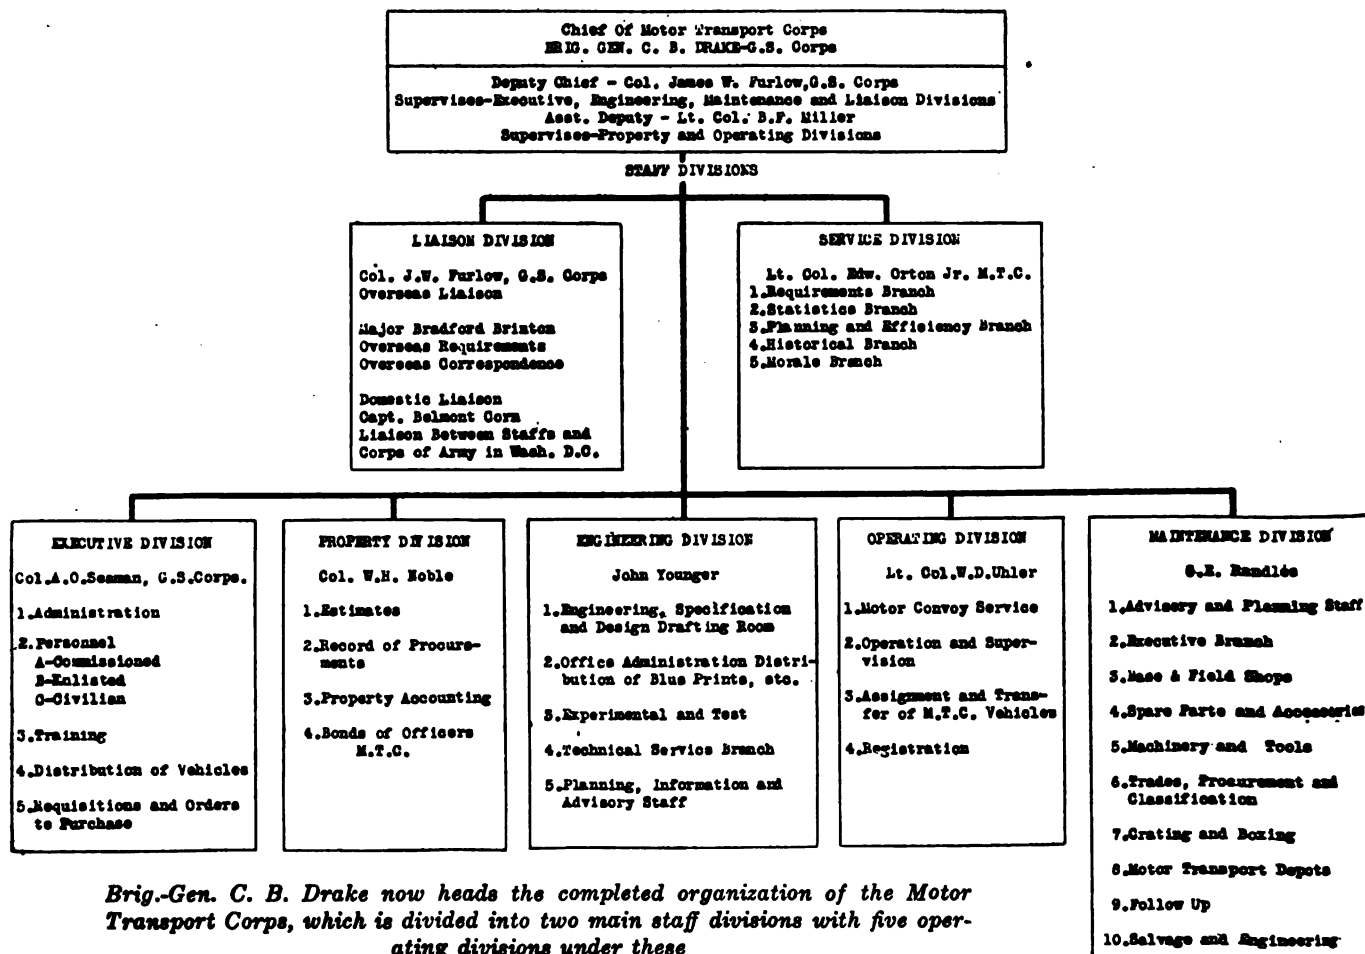

road and the adoption of rules making it available for pleasure travel would mean a greater use of motor cars between the two cities.

There is also a movement on foot to construct a similar road between Osaka, the greatest manufacturing center of Japan, and Kobe, which is fast becoming the largest shipping port. This has been discussed for several years, but only last fall was there evidence that the plans had attained tangible form.

Throughout the country there are numerous bridges far too lightly constructed to carry a motor car. It is no extraordinary experience, in endeavoring to reach a certain point even within short distance of the largest cities, to have to stop at a bridge and complete the trip by jinricksha or by walking a mile or more. The army has had some of its loaded trucks fall through bridges, and these experiences have resulted in the reconstruction of many bridges upon orders from the War Office.

Driving in cities is a task that requires concentration on the part of the driver. While in the large municipalities there is a fair mileage of wide streets, a majority of the streets are too narrow for the operation of a motor car. One of the traffic regulations provides that passenger cars shall not be driven through roads of a width less than two and a half times the width of the car, and transport vehicles shall not traverse roads which are not more than 4 ken (24 feet) in width, unless special permission is given by a police official having jurisdiction over the district. The only deviation from this regulation permitted is when there is no wider road leading to the residence of the owner of the house or person which one wishes to visit or when the distance to be traveled is a short one. In these narrow streets and even in streets through which travel is permitted there is such a mass of slow-moving vehicles and pedestrians that progress is necessarily slow. The pedestrian has the right of way and is almost unmoved by the warning of a motor horn. (To be continued)

## Present Organization of the Motor Transport Corps

*Brig-Gen. C. B. Drake now heads the completed organization of the Motor Transport Corps, which is divided into two main staff divisions with five operating divisions under these*

# Tractor Activities in Illinois

## Three Centers of Tractor Manufacture in the State—Types Manufactured by and Scale of Production of Different Concerns—New Manufacturing Equipment

By P. M. Heldt

**T**AKING volume of production as the basis, Illinois is probably the greatest tractor manufacturing state in the Union. The state has three great tractor centers—one at Peoria, another in the Illinois portion of what is commonly referred to as the Tri-Cities (Rock Island and Moline) and the third at Chicago. The latter city is a center for tractor activities in general and boasts of a good many tractor parts factories and branches or depots of parts factories located in other sections of the country. Not all of the State's tractor interests are centered at the points mentioned, however, as there are more or less important plants also at Bloomington, Quincy, Joliet, etc.

In Peoria the lists show no less than five tractor factories. It is of interest in this connection to point out that Peoria is also a great distributing center for tractors and most of the large manufacturers in other parts of the country and especially those associated with the implement industry, have distributing branches here from which the central Illinois territory is supplied. Most of these branches are located close together, and Peoria may be said to have what amounts to a tractor row, the same as other cities throughout the country have their automobile row. This tractor row is, however, not located in the high rent district and the buildings on it are impressive more on account of their substantial construction than for any gaudiness of their decorations.

### Holt on War Work

Of the five tractor plants in Peoria that of the Holt Mfg. Co. is at present engaged on Government work exclusively and may be passed over here. The Holt plant is the home of the battle tank and was largely devoted to war work even before the U. S. entered the arena as a belligerent.

The other big tractor plant in the city is that of the Avery company which turns out between 10,000 and 12,000 machines

a year. Considerable export business was done last year, between 400 and 500 tractors having been sent to Italy, a few less to France and some also to England. The concern manufactures seven different models of which the smallest, the 5-10 hp. model recently fully described in *AUTOMOTIVE INDUSTRIES*, sells at the low price of \$550. This model has a four cylinder upright engine, while all the others have horizontal opposed engines and are designed all on the same lines. All these horizontal engines have removable cylinder walls, water-tight joints being obtained at the crank end by means of rubber packings and at the head end by means of the usual gaskets. Among the outstanding features of the Avery line are the following: Valves in removable heads; very substantial crankshafts (not a single shaft having broken to the company's knowledge though some 25,000 tractors have been turned out since the concern engaged upon this line of work in 1908); fuel gasifiers permitting of the use of kerosene; adjustable main bearings on crankshaft; exhaust induced air circulation through cooler; transmission through a train of spur gears giving a double reduction, the simplest type of transmission that could be used on a tractor; a sliding frame carrying the driving pinions whereby the same large diameter gear is used for all speeds. In addition to the seven tractor models the Avery company also manufactures a motor cultivator which plows two rows at a time.

The Acme Harvesting Machine Co., whose plant is located some distance out of Peoria on the interurban line to Pekin, manufactures a 3-plow tractor which can be furnished either as a wheeled or creeper type or both wheels and creeper outfits can be furnished for the same machine. This concern has turned out about 50 tractors to date, having started in the business a year and a half ago. The machine is a 3-plow tractor of 12-24 hp. and is fitted with a 4½ x 6 in. Beaver engine, Climax radiator, Donaldson air cleanser. Practically

Avery 40-80 tractor used in road grading

*Acme 3-plow wheeled tractor. This machine is also made in a creeper type*

all of the other parts, including the clutch and transmission, are of the company's own design and manufacture. The tractors manufactured so far have been sent to different parts of the country to test them out under different soil conditions and it is likely that the business will be greatly expanded in the near future, as the demand the past year was away beyond the capacity of the plant to supply. The machine as a wheeled tractor sells at \$1,800, as a creeper at \$2,250 and as a convertible wheeled tractor and creeper at \$2,450.

#### Peoria Has New Four-Wheeled Model

The Peoria Tractor Co. at the time of the writer's visit was about ready to start upon the manufacture of a new four-wheel tractor assembled from standard parts. This firm is a reorganization of another one which began the manufacture of tractors in 1914 and up to the end of 1917 had turned out between 700 and 800 three-wheel machines having a rating of 8-16 hp. and selling at \$650 to \$725. This three-wheel tractor was equipped with a  $3\frac{1}{4} \times 5$  in. four-cylinder engine and was rated as a 2-plow machine. The reorganization referred to took place at the beginning of this year and previous to that time the old company had already been working on the new model, of which a full description appeared in AUTOMOTIVE INDUSTRIES some months ago. Since the reorganization some additional three-wheel machines and about 20 of the new model had been turned out.

The American Motors Corporation is a reorganization of the Huron Tractor Co. of Illinois which formerly had its headquarters at Chicago. Experimental work was taken up by the Huron company in 1915 and the removal to Peoria was effected in December last. Up to date between 50 and 60 tractors have been completed. This is an assembled machine, the main feature being in the transmission and rear axle construction which are of the company's own design. The trade name Yankee has recently been adopted for the product of the concern. A special feature is the one lever control. Every function of the tractor is controlled by a single lever, including three forward speeds and reverse and the engagement of the belt pulley. The engine is a four-cylinder Erd having  $4 \times 6$  in. cylinders and turning at 925 r.p.m. A Borg & Beck disk clutch is used and the transmission, which, as already stated, is original with the company, affords three forward speeds and one reverse, the speed range obtainable being from  $1\frac{1}{2}$  to  $4\frac{1}{4}$  m.p.h. The belt pulley is 11 in. in diameter and runs at 925 r.p.m. Considerable attention has been paid to items of design which affect the comfort and convenience of the operator. The tractor may be mounted from either side. To fill the radiator the operator stands on the front axle. The kerosene tank, which forms the hood of the machine, is filled from the platform. The operator's seat is cushioned and has a lazy back. There are foot rests on the operator's platform and there is ample leg room. The final drive is by internal spur gears.

In Rock Island and Moline there are three big plow companies which have entered the tractor industry and are destined to play an important part in it. The largest producer among these at the present time is the Moline Plow Co., which manufactures the two-wheel Moline Universal. This was originally a two-cylinder machine, but a new model with a four-cylinder engine was announced in June last and a full description of it appeared in AUTOMOTIVE INDUSTRIES at that time. The Moline Plow Co. erected special works for its tractor department which are very spacious, and all of the parts, including the engine, are manufactured in these works. The company turned out 12,000 tractors during the past business year, and this scale of production will undoubtedly be exceeded during the coming year. Various innovations were shown the writer at the time of his visit to the plant. Thus, it has recently placed in service a bearing die casting machine by which the babbitt metal is cast into the big ends of the connecting-rods. This machine has a capacity for 300 to 350 rods a day. The molten babbitt is forced into the die under an air pressure of 50 lb. per sq. in., which makes a very nicely finished job. Another innovation contemplated was the installation of pyrometers on all core ovens. Heretofore foundries have lost many cores on account of irregular heating, which loss can be obviated by the use of pyrometers. The Leeds-Northrop pyrometer equipment will be used. The company designed a special milling machine for straddle milling the lugs on the steering yoke, by means of which six surfaces are milled at the same time. Another interesting device used in the manufacture of this tractor is a fixture for

*15-30 hp. International kerosene tractor, which handles 4 plows*

marking the timing on the flywheel. The latter is located by means of two pins passing through bolt holes in the flywheel web and the marks on the flywheel rim are then made by dealing a hammer blow to dies which can move radially inward toward the axis of the flywheel. At the time of the writer's call the plant employed about 1000 men.

#### Velie Production Held Down by War Work

The Velie Motor Vehicle Co., which has been heavily engaged on war work during the past year, has not pushed its tractor operations. At the time of the writer's call it was putting through a lot of 100 tractors which it was intended to complete and then stop tractor work for the duration of the war. These tractors were to be sent to different parts of the country so as to bring out any possible hidden defects and gain further experience for use in the development of the tractor model which the company expects to place on the market after the war on a large scale.

The Rock Island Plow Co., Rock Island, Ill., is the manufacturer of the Heider tractor, which was formerly manufactured by the Heider Manufacturing Co., Carroll, Iowa. Work was carried on at Carroll from 1908 to 1915 and on Jan. 1 of the latter year operations began at Rock Island. The company is at present turning out two four-cylinder jobs the leading characteristics of both of which is the friction drive. These tractors were described in a recent issue of AUTOMOTIVE INDUSTRIES and it is not necessary to go into details here.

#### International Harvester Has Several Models

In Chicago are located the main headquarters of the International Harvester Co. which figures very prominently in the tractor field. The company turns out a complete line including the International 8-16 hp., the Mogul 10-20 hp., the Titan 10-20 hp. and the International 15-30 hp. All of this company's models burn kerosene. The engines have from one to four cylinders, and, curiously enough, the smallest and the largest models are the four cylinder ones. The 15-30 hp. International, which is typical of the company's machines, has a four-cylinder horizontal engine of 5¼ in. bore and 8 in. stroke. This engine is set with its crank extending across the frame, the cylinders lying back of the crankcase. The cylinders are cast in pairs which are placed some distance apart so as to provide space for a liberal-sized central bearing on the crankshaft. The valves are located in the removable heads and the kerosene vaporizers are directly above the cylinder heads so the combustible mixture is drawn in to the cylinders partly by gravity and there is no possibility of "loading". The air is first drawn through a dust separator and then through an air heater surrounding the vertical exhaust pipe. Transmission is by sliding pinions, and two forward speeds and one reverse are obtainable. The final drive to the rear axle is by inclosed chain. The two speeds are 1.8 and 2.4 m.p.h. Cooling is by radiator and fan, the cooling system having a capacity of 40 gal. Rear wheels are 66 x 14 in., front wheels 40 x 7 in. The engine is of the low speed type (575 r.p.m.) and the weight of the tractor is relatively high, being 8700 lb. dry. The fuel capacity is 24 gal. and fuel and water add about 500 lb. to the weight. The front axle is spring mounted, short coiled springs surrounding the knuckle pins above the knuckles.

#### Improvements in the Parrett

Several improvements have been introduced in the new model of the Parrett Tractor Co. of Chicago. The Parrett Co. has always used the Buda engine and the new model has the Buda Model HTU special tractor engine. One of the particular advantages of this engine is that it has a detachable head. Cylinder dimensions are 4¼ x 5½ in. and the tractor is rated at 12-25 hp. A change has been made in the transmission which now gives three forward speeds, viz.: 1¼, 2½ and 4 m.p.h., besides the reverse of 1.8 m.p.h. The final drive, which, as formerly, is by internal gears, is now inclosed. A novel attachment original with the Parrett concern is the air washer of which a sectional view is shown herewith. The air enters on top and passes down through the central tube to the bottom where it bubbles through the water. On passing up again through the washer the air is compelled to pass through

a series of perforated baffle plates which breaks the bubbles up very finely, thus causing all dust held in suspension to come in contact with the water and to be moistened and precipitated.

The Parrett company, which was reorganized nearly a year ago, at which time additional capital was put in, manufactured 600 tractors last year and plans to double this output the coming year.

The Square Turn Tractor Co., which was organized in Chicago and for a considerable period occupied extensive offices in the Lytton Building, has removed to Fremont, Neb. Similarly, the Stutes-Mar Farm Tractor Co., which formerly had offices in Chicago, has moved to Frankford, Ind., where it is developing a tractor of the creeper type, a machine of rather large size.

At Joliet the Joliet Oil Tractor Co. is manufacturing on a moderate scale the new model of the Bates Steel Mule. This is a machine of the combined wheel and creeper type, having two steering wheels in front and two chain tracks at the rear. It has a four-cylinder 4 x 6 in. engine and is rated at 12-20 hp., or as in the 3-plow class. A centrifugal air cleaner is fitted and the engine is designed to burn kerosene, of which a supply of 10 gal. can be carried.

It might be supposed that the use of wheels would annul the advantage of the crawler of exerting a very light pressure per square foot of ground contact surface, but this is not so, as of the total weight of 4300 lb. only 240 lb. is supported by each front wheel. Two speeds are available, of 2.4 and 3.5 m.p.h. respectively. The two crawlers are pivoted on the rear axle and their forward part is pressed against the ground by springs located midway between the front and central wheels of the crawler. A plow type seat is mounted on the transmission box and the tractor is steered and controlled much the same as an automobile. The tread over the front wheels is a good deal wider than that over the crawlers and when plowing one front wheel runs in the furrow, rendering the tractor self-steering, while both crawlers run on unplowed ground.

Although the center of gravity is quite low the ground clearance at the lowest point is 14 in. The belt pulley is 12 in. in diameter by 8½ in. face and runs at 725 r.p.m. All transmission shafts and main drive shafts run on Timken roller bearings. All gears and gear shafts are of alloy steel and

Parrett air washer

Rear view of the new Parrett showing enclosed drive

*The Bates Steel Mule model D*

the gears are hardened and ground. The whole transmission and drive is inclosed and runs in oil.

#### Dayton-Dick Co. Manufactures the Leader

At Quincy, Ill., the Dayton-Dick Co. manufactures the two-cylinder Leader tractor. The two cylinders are arranged opposite each other and have 6¼ in. bore by 6 in. stroke, the horsepower rating being 18 on the belt and 12 on the drawbar. From the crankshaft the power is transmitted by chain to a countershaft carrying the sliding pinions for the two forward speeds. These speeds are 2 1/3 and 3 1/3 m.p.h. The change speed gearing and differential are enclosed, but the chain transmission from the engine shaft and the final drive by bull gears are exposed. The front axle is of the automobile type, with pivoted steering knuckles and the forward end of the frame has a spring support on it. Rear wheels are 48 in. in diameter by 12 in. face and are provided with cone lugs or cleats. The front wheels are 30 x 5 in. The tractor complete weighs 4800 lb. and has a wheelbase of 81 in. Kerosene is used as fuel and is fed to the carburetor by the Stewart vacuum system.

The Bullock Tractor Co. of Chicago manufactures a line of crawler tractors comprising four models. The machine was originally developed in Iowa and was produced for a couple of years by the Western Implement Co. of Davenport. In November, 1913, the Bullock company was formed and took over the business. This firm turns out about 350 machines a year.

The Bullock tractor is of the type having no wheels at all, steering being effected by locking one of the creeper driving shafts.

## Official Bulletin on Diesel Engines

The lesson in economy in power production and use which America was forced to learn under war conditions is inclining a large number of people to consider carefully the claims of the more efficient engines, according to the Bureau of Mines, Department of the Interior. The limits of the peculiar field in which each engine is pre-eminent constantly change with the fluctuating costs of fuel, labor and investment. The Diesel engine is so far the most efficient mechanical device produced for changing the heat of fuels into power, says the bureau. That the fuel must be in liquid form and, therefore, relatively expensive has been one of the elements that has so far limited its use in competition with power plants starting with solid fuel, but the rise in price of coal and the increasing production of burnable fluids from coal distillation may at any time produce a profound change in these relations.

The Bureau of Mines has just issued Bulletin 156, "The Diesel Engine, Its Fuels and Its Uses," by Herbert Haas, which is both informative and readable and contains the facts which the interested reader, both non-technical and technical, most desires to know. The characteristics of the type, theoretical, mechanical and practical, concerning the engines built in this country are given. The chapter on fuels desirable for these engines is especially valuable and timely.

Copies of this bulletin may be obtained free of charge by addressing the Director of the Bureau of Mines, Washington, D. C.

### Cutting Lubricants

THE Department of Scientific and Industrial Research has recently published a memorandum on cutting lubricants and cooling liquids, in which it states that the mineral oils, which are best suited to be used as cutting lubricants, either alone or mixed with animal or vegetable oil, are mineral oils, preferably of pale color, of low viscosity, ranging from 100 sec. to 200 sec. Redwood at 100 deg. F. The lower viscosity oils may be used for high-speed conditions and oils with higher viscosity may be used for slow-speed conditions. Of the animal oils used either alone or in admixture, tinged lard oil containing as much as 10 to 15 per cent of free fatty acid is most frequently employed. Prime lard oil is almost free from acid; it is much more expensive than tinged lard oil, but is less inclined to gum under severe conditions—heavy cut and high speed. Lard oil congeals in cold weather, so that, wherever possible, a mixture of lard oil and low cold test mineral oil is to be preferred on account of greater fluidity in the cold.

# Labor the Next Great Problem

## Recriminations Between Industrial and Labor Leaders Forecast Another Struggle—Bethlehem Steel Co.'s Plan for Dealing with Labor—Right to Organize Cannot Be Questioned

By Harry Tipper

**T**HE abrupt termination of hostilities and the consequent speculation upon future conditions have brought the labor problem squarely to the front as an uncertain and difficult factor in the readjustment.

The public discussion between William H. Barr, president of the National Founders' Association, and Samuel Gompers, president of the American Federation of Labor, indicates the lack of common ground for action which governs the consideration of these industrial groups. This is particularly emphasized by the somewhat belligerent tone of the utterances.

It is unfortunate that a public discussion of these matters should have been started and emphasized in this particular way before the character and extent of the problem have been measured. If these are to be considered as typical of the positions which will be taken by groups of manufacturers and groups of labor organizations, it is evident that the war has not particularly increased the desire for common action in or materially lessened the hostility of these large organizations.

This sudden transition from the requirements of war to the problems of reconstruction imposes upon the individual the necessity for action if he is to avoid the turmoil which follows the economic changes. The necessity of taking advantage of the present position is measured by the imminence of the period of readjustment and the certainty of industrial conflict unless measures are taken to meet them. That there is an increasing appreciation of this necessity is indicated by the constant announcement of new plans dealing with the matter from the individual organization standpoint. It is significant that announcement has been made of such a new plan by the Bethlehem Steel Corporation, and the details of this plan indicate its far-reaching character.

It is interesting to note that this plan specifically admits the right of the man to join a labor organization and states that the proposed plan does not abridge or conflict with this right.

In the consideration of plans for the development of machinery, within the corporation, to take up and handle the problems of employer relations, there are certain fundamental requirements which must govern each plan. These requirements must be based upon recognition of the place and value of labor organizations, the necessities of the workers, the responsibilities accompanying government of an

industrial establishment, in order that any plan will be of service and not a mere shell.

The right of the worker to organize must be recognized. This right is just as clear as the right of any other body of men to organize for their own interests. The recognition must be definite and whole-hearted. Without it there can be no common ground for peaceful solution of the problems. The value of any particular type of organization may be questioned, and the manufacturer should recognize that labor organizations, as constituted at present, do not solve his individual problem, but rather intensify some portions of it—the uncertainty of agreement, the difficulty of decision, the tendency of movement from plant to plant, the lack of organizational incentive.

### The Responsibility of Industry

Plans must be based upon a recognition of the fact that absolutism or autocratic control of industry is no more justified than absolutism or autocratic control in political government. It must be recognized that the worker who has been fighting or working for a democratic ideal—one in which each man has some share in his own destinies politically—will not be content for long to continue under an industrial control which does not permit or recognize the same principles. Control must be given up voluntarily in some slight degree, in order to secure efficiency, co-operative responsibility and stability of industrial operation.

The idea that the worker is not intelligent enough to exercise some share in the decision of industrial matters relating to his working conditions is as false as the idea that he is not sufficiently intelligent to share in the government of his country. Intelligence is increased by responsibility, the necessity for decision and action. Responsibility has always developed conservatism and careful operation. Every organization endeavor in human affairs has shown that control, voluntarily shared, induces a unity under leadership which cannot be attained by any amount of arbitrary control.

Some form of elective, representative systems for governing these matters is desirable. It is old and usual; every form of co-operative organization employs some system of this type. It is, therefore, understood and readily measured by the employees of an establishment. In all the individual cases, so far observed, some organization of this type is used

for the purpose. In this connection the methods employed by the Bethlehem Steel Corporation are quoted:

#### I—REPRESENTATION

1. Representation shall be on the following basis:

Plants employing under 1500 employees: One representative for each 100 employees.

Plants employing 1500 to 10,000 employees: One representative for each 200 employees.

Plants employing over 10,000 employees: One representative for each 300 employees; provided, however, that in no case shall there be less than 10 representatives.

Such adjustments as may be necessary to meet special cases shall be made.

2. For the purpose of applying the unit of representation, the plants should be subdivided according to departments and natural subdivisions. Wherever it is necessary to group a number of small departments in order to complete a unit of representation, regard shall be had to logical groupings and location.

3. Adjustment in units of representation shall be made in accordance with the recommendations of the Committee on Rules.

#### II—TERMS OF REPRESENTATIVES

1. Representatives shall be elected for a term of one year, and shall be eligible for re-election.

2. A representative may be recalled upon the approval by the Committee on Rules of a petition signed by two-thirds of the voters in his department.

3. A representative shall be deemed to have vacated office upon severance of his relations with the company or upon his appointment to such a regular position as would bring him within the meaning of Paragraph 3, Section 3, entitled "Qualifications of Representatives and Voters."

4. Vacancies in the office of representative may be filled, in the discretion of the Committee on Rules, by special elections conducted in the same manner as the general elections.

#### III—QUALIFICATIONS OF REPRESENTATIVES AND VOTERS

1. Any employee who has been on the company's pay-

rolls for a period of six months prior to nominations, who is 21 years of age and over, and who is an American citizen or has taken out his first papers, shall be considered qualified for nomination and election as a representative.

2. All employees who have been on the company's payrolls for a period of at least sixty (60) days prior to the date fixed for nominations, and who are 18 years of age or over shall be entitled to vote; provided, however, that in case of the first elections, thirty (30) days on the company's payrolls shall suffice.

3. Company officials and persons having the right to hire or discharge shall not be eligible as representatives or qualified to vote for representatives.

#### Economic Values

The manufacturer should understand thoroughly that control or precedent is not important. Labor costs are relative, time and production factors governing. Labor in Great Britain in 22 industries averaged \$750 per person in 1913. In 1918 it averaged \$2,300 per person. Wages increased about 100 per cent. Production has increased about 300 per cent.

Turnover, absence from work, strikes, fatigues, and all these items of economic waste in labor rise out of psychological causes in the man and must be cured by human developments. The justification for the owner and manager of industries does not lie in precedent, in desire for control, nor in any disbelief in the intelligence of labor. The verdict upon his management will be placed by the record upon the efficiency of his production and that very economic situation depends upon a thorough knowledge of human desires and aspirations, a decent analysis of history and a conservative courage which will thoroughly determine the cause and then act confidently on the solution of it.

**Rear View of the SE-5 Tractor Scout**

*This machine is fitted with a 140-hp. Hispano-Suiza engine and carries one Vickers and one Lewis machine gun with Constantinesco interrupter gear. The machine complete weighs 1930 lb., has an endurance at 10,000 ft. (including climb) of 2½ hr. and a ceiling of 20,000 ft. Its speed at ground level is 129 m.p.h. and at 10,000 ft. 120 m.p.h. The climb to 10,000 ft. requires 11 min. Following are the chief dimensions: Span, 27 ft. 11 in.; overall length, 20 ft. 11 in.; height, 9 ft. 6 in. This model was brought out by the British Royal Air Craft factory in December, 1916*

# Lubrication and Fuel Tests

Paper Presented to the Mid-West Section of the Society of Automotive Engineers  
Dealing with Tests Made on a Buda Tractor Type Engine

By P. J. Dasey\*

THE demand for heavy duty engines of the four-cylinder, four-cycle, vertical type, especially for use in farm tractors, has made it necessary, in order to meet the heavy service requirements, to make alterations in design with the idea of not only strengthening such parts as are under maximum load conditions during practically all of the operating period but also to allow of adjustments to shaft and connecting-rod bearings with the least loss of time and effort.

The Buda HTU model engine, which was announced some months ago, and which is now being supplied to various firms in the tractor industry, illustrates the latest development in the medium size of four-cylinder engines produced by the Buda company for use in farm tractors and heavy duty trucks.

In exterior appearance it differs from the conventional type only in the detachable head and split oil pan, two features that are highly valuable in tractor work where the excessively heavy duty it is called upon to perform makes it necessary that access to cylinders, valves and crank bearings be easy as well as rapid.

For quick reference the general dimensions of the engine are as follows:

Type.....	Four cylinder, vertical, en bloc "L" head type, four cycle	
Bore.....	4 1/4"	
Stroke.....	5 1/2"	
Weight.....	About 800 lbs. with regular equipment	
Suspension.....	3 point	
Ignition.....	Any standard type of magneto or ignition system	
Carburetor.....	1 1/4" vertical outlet	
Lubrication.....	Gear pump force feed system	
Cooling.....	Centrifugal water pump	
Fan.....	Not furnished.	
Extreme length of crank shaft.....	32 1/2"	
Height from center of crank shaft to top of water outlet pipe.....	25 1/4"	
Distance from center of crank shaft to bottom of engine.....	9 1/2"	
Distance from center of front supporting bracket to center of rear supporting arm.....	34 1/4"	
Drop of supporting arms from center of crank shaft to top of frame.....	4" to 6"	
Drop of front support bracket.....	2 1/2" or 3 1/4"	
Length of rear supporting arm.....	25 1/4"	
Length of engine over cylinders.....	24 1/2"	
Diameter of fly wheel.....	17"	
Wt. of fly wheel.....	Truck, 76 lbs. to 115 lbs. for Tractor	
Face of fly wheel.....	3 1/2"	
Fly wheel regularly furnished for multiple disc clutch.....		
Diameter and length of front bearing.....	2 1/4 x 3 1/4"	
Diameter and length of middle bearing.....	2 1/4 x 2 1/4"	
Diameter and length of rear bearing.....	2 1/4 x 4"	
Diameter and length of connecting rod bearings.....	2 1/4 x 2 1/4"	
Connecting rod length from center to center.....	12 1/2"	
Diameter and number of connecting rod bolts.....	1 1/2" - 4	
Diameter and length of piston pin bearing.....	1 1/2 x 2 1/4"	
Length of piston.....	5 1/2"	
Effective working diameter of valves.....	1 1/2"	
Use 1/8" 18 standard thread, S. A. E. spark plugs.....		
Piston displacement in cubic inches.....	312	
Internal diameter of bell housing flange.....	16 1/4"	
External diameter of bell housing flange.....	17 1/4"	
Diameter of bolt circle.....	16 1/4"	
Diameter of bolts.....	1 1/8"	

NOTE.—This engine furnished in the bell housing (unit feature) only.

The split oil pan is a feature which has proven highly valuable in practice, as it permits of the bearings being examined and adjusted without the necessity of removing the transmission from the bell housing.

The valve timing is as follows:

- Inlet opens 15 deg. past top center,
- Inlet closes 40 deg. past bottom center,
- Exhaust opens 45 deg. before bottom center,
- Exhaust closes 10 deg. past top center.

While this valve setting has worked out well in practice, it has not, by any means, been determined that it is the most efficient; hence further experimentation is being carried out which it is hoped will ultimately determine what change, if

any, is necessary in the timing to secure maximum results in the use of fuel as well as in life of valves, etc.

The intake valve areas have been designed for high velocity of the ingoing mixture—

At 600 r.p.m. the velocity is approximately 6033 lineal ft. per min.

At 800 r.p.m. the velocity is approximately 8044 lineal ft. per min.

At 1000 r.p.m. the velocity is approximately 10,055 lineal ft. per min.

At 1200 r.p.m. the velocity is approximately 12,066 lineal ft. per min.

(These figures are based on calculation only.)

The vacuum readings at the same speeds are:

At 600 r.p.m., .45 in.

At 800 r.p.m., .80 in.

At 1000 r.p.m., 1.25 in.

At 1200 r.p.m., 1.60 in.

The water pump is of the ordinary rotary vane type with a capacity of:

4 1/2 gal. at 400 r.p.m.

8 1/2 gal. at 700 r.p.m.

11 gal. at 900 r.p.m.

14 gal. at 1200 r.p.m.

The projected area of the wrist pin bearing is 2.39 in. (1.125 in. x 2.125 in.), carrying a total pressure of 2001 lb. or approximately 837 lb. per sq. in.

The projected areas of the main bearings are:

Front main bearing, 6.7 sq. in.; load approximately 720 lb. per sq. in.

Center main bearing, 6.18 sq. in.; load approximately 780 lb. per sq. in.

Rear main bearing, 9.49 sq. in.; load approximately 518 lb. per sq. in.

Total of all main bearings—22.37 sq. in. with an average pressure of 672 2-3 lb. per sq. in. Ratio to piston displacement, 13.5 to 1.

The connecting-rod bearings each have 5.31 sq. in. with a pressure per sq. in. of 908 lb.

The valves have semi-steel heads electrically welded to .20 carbon, 7-16 in. diameter stems. They lift 5-16 in. and have 1 1/8 in. diameter in the clear. The camshaft (1 in. in diameter) and cams are turned out of solid bar, cams being 3/4 in. wide. There are three bearings of ample proportions.

The crankshaft is made of .45 carbon open-hearth steel; the connecting rods of .25 carbon open-hearth steel.

A pressure lubrication system is used which forces the lubricating oil to all crankshaft, crankpin, wristpin and camshaft bearings, the pressure ranging from zero up to 30 lb. at 1000 r.p.m.

The pressure is furnished by a gear pump mounted on the bottom and at the rear end of the oil pan and driven by spiral gears mounted on the cam and pump shafts. The oil is carried in the oil pan and before reaching the pump must pass through a bronze wire screen mounted near the center of the oil pan, after which it enters a passage leading to the intake side of the pump. From there it is forced up a passageway leading to a tube which runs the length of the engine and from which passageways lead to the main bearings and camshaft bearings. From the main bearings the oil is fed to the crankpins through holes drilled through the crankshaft and from the connecting-rod bearings to the wristpin bearings through copper tubes clamped to the sides of the connecting rods. The cylinders are lubricated by the oil thrown

\*Sales and Research Engineer, the Buda Co.

off the connecting-rod bearings at the crankpins, while the cams, push rods, tappets and valve stems are lubricated by oil being thrown by the cams and cranks to the guides above.

A relief valve is provided in the main oil line at the front of the engines so that when the pressure reaches the point at which the spring is set to operate, the ball check is raised and the oil flows into the front gear case, thus furnishing a constant supply of oil to the gears. In order to hold a constant reservoir of the oil in the gear case a small dam is cast across the outlet so that the oil level is always above the bottom of the gear mounted on the engine shaft.

### Lubrication

In connection with the work already accomplished in the designing and working out of the full pressure system described considerable work has been done along the lines of determining what kinds of oils are best suited for use in this type of engine.

Internal combustion engines of this type have two major conditions in lubrication to be met at the same time and with the same oil, namely, cylinder lubrication under high heats and pressures, and crankshaft and connecting-rod bearings under comparatively little heat but high pressure. The lubricant must have the necessary body and viscosity at 150 deg. F. to withstand the extreme pressures in the crankpin and main bearings without permitting the metal surfaces to come in contact; also that its viscosity at 350 deg. F. be such as to provide a perfect piston seal, and to carry the pressures exerted against the piston and cylinder walls, under very high heat conditions, with the minimum of "cracking" or decomposition of the oil.

The oil must not only have these characteristics but must be fluid at reasonably low temperatures, although for pressure feed types the cold test is not so important—so far as feeding the lubricant is concerned during cold weather.

As a general rule, oils of low gravity "crack" or decompose under lower temperatures and pressures than do oils of higher gravities, the result being more rapid consumption of the oil, partly as fuel, partly in the formation of carbon deposits in the cylinders, and partly in the increase of the heavy tarry ends being washed down into the reservoir.

The more a given oil "cracks" or decomposes the less its value as a lubricant becomes, as the process of "cracking" not only allows parts of the lighter vapors so released to be used as fuel, but some of the heavier vapors condense and are washed down with the heavy tarry ends, thus raising the gravity (making the oil lighter), also lowering the flash and fire points to a considerable degree. This condition makes rapid use of the lubricant not only unavoidable but also causes considerable difficulty with carbon deposits on plugs, cylinders, pistons and rings, and if continued for any great time without being replaced with new oil, will cause the crankcase oil to eventually become a thick tarry mass, too heavy to circulate freely, hence dangerous to use further.

The lighter gravity oils are usually subject to a higher de-

gree of evaporation and to a lesser degree of cracking; hence in order to get a satisfactory lubricant that will serve both cylinder and bearing conditions with the least decomposition yet with the highest flash and fire points and viscosity from which the best average results may be expected, characteristics have been tabulated for those desiring to take advantage of the same.

Oils specified for summer use only are much heavier in body than those specified for all year round service, and while they can be used in the summer only because of their remaining in a fluid condition, they will carbonize more freely than will the lighter oils. They are more viscous, however, and will carry the loads placed upon them with less wear to the bearings, etc., than will the lighter oils. It is a matter of choice as to which oil one prefers to use, all things considered. One reason for not using heavy oils in the winter time is that the oils become very thick (viscous) in low temperatures and hold the pistons so tight that it requires considerable power to move them when starting.

Gravities do not play an important part in the selection of an oil. The principal points to judge by are the flash and the fire points and the viscosities at 150 deg. F. and 350 deg. F. While the crankcase oil will vary in temperature under different working conditions, also in winter and summer, the point of 150 deg. F. has been taken as a basis of calculation, while the 350 deg. F. point more nearly approximates that under which the oil must work in the cylinders, hence the viscosity at that point is important.

Some oils show high viscosities at 150 deg. F. and 212 deg. F., but at 350 deg. F. are greatly reduced; others show ordinary readings at the first mentioned temperatures and drop but little at the latter point.

The best results will be obtained from an oil, all other things being equal, that shows the greatest viscosity at not only 150 deg. F. but also at 350 deg. F. In other words, an oil having the proper cold test, flash and fire points and which will show the greatest viscosity at 150 deg. F. and at 350 deg. F. will give far better service as a lubricant under heavy duty working conditions than will an oil as good in all other respects but with a relative low viscosity at 150 deg. F. even though it might be the same at 350 deg. F., which of course is not likely to happen.

There is such a difference in oils that it is impossible to tell without actual tests or a complete dependable table of characteristics, including viscosities at 350 deg. F., just which kinds will best fill the bill for any particular purpose, but I feel sure the day is coming when more attention will be given to this end of the engine business and a means found of giving the information secured to the engine owner to the end that he will be relieved of any uncertainty or guesswork regarding what he should use to derive the best results and maximum service.

It will be noted in the specifications tabulated there is considerable leeway in all characteristics except the viscosity at 350 deg. F. (Universal Saybolt viscosimeter), where the limits

Horsepower curves corresponding to different fuels

are rather close. The oils which come within these limits naturally have the desired characteristics at the lower temperature, flash and fire points, hence it is important that in addition to all other characteristics of an oil its viscosity at 350 deg. F. and cold test be obtained.

This data is based on the requirements of an engine of the type described in which the oil is used for lubricating all bearings as well as cylinders, etc., and should therefore not be confounded with specifications which might be deemed desirable in an oil which was to be used in any other type of machinery or engines. It was because of the excessively heavy duty work this type of engine was called upon to perform that investigation of the oil problem was taken up. Considerable work has already been done but much more remains to do; in fact, it is practically an endless labor.

## OIL SPECIFICATIONS FOR FULL PRESSURE ENGINES

All year round oils:

Gravity, Deg. B.	Flash, Deg. F.	Fire, Deg. F.	Saybolt Viscosity at 212 Deg. F., Seconds	Viscosity at 350 Deg. F. Seconds	
20 to 30	415 to 465	455 to 520	58 to 85	36 to 40	Cold test not to exceed 32 deg. Preferably 20 deg. to 25 deg.

Heavy oils for summer use only:

Gravity, Deg. B.	Flash, Deg. F.	Fire, Deg. F.	Saybolt Viscosity at 212 Deg. F., Seconds	Viscosity at 350 Deg. F., Seconds
22 to 29	470 to 530	530 to 600	100 to 125	40 to 45

## Fuel Tests

While the engine is designed primarily for the use of gasoline, it can be provided with a low compression head so that those desiring to use kerosene may do so by applying such apparatus as they determine is best adapted to the handling of that fuel. No such device is furnished as a regular part of the equipment.

As a part of the research work carried on in connection with the HTU engine, tests have been made on "cracked" fuels of different weights in order to determine whether it was possible to use such fuels in an engine of this type designed and equipped for the use of gasoline, and the results are given in Table I (see page 887).

Please note the gravities of the fuels used:

The plotted curves will more readily illustrate the results obtained, but before going further I wish to explain that the tests were made with a regular Stromberg carbureter, 1½ in. size, attached to a gasoline manifold (unheated) and that no hot air stove nor other means of heating was provided—in fact, it was the regular gasoline equipment. A Sprague electric cradle dynamometer was used, with all the necessary equipment for weighing the fuel, counting the revolutions, timing, taking temperature of water inlet and outlet as well as oil temperature in the crankcase manifold, vacuums, etc.

Work done per gal. of fuel

Specific fuel consumption at different speeds

On page 876 at the bottom of the first column are shown horsepower curves of all five tests, including the kerosene test which was made with a low compression head and heated manifold, but without hot air being taken through the carbureter. That particular test was made only for horsepower determination and no record was kept of fuel consumption per b.-hp. per hour.

Note the horsepower readings at the different revolutions per minute points and the fuel making the best showing—

At 400 r.p.m., first in power is cracked benzine;  
second, " " gasoline;  
third, " " synthetic crude;  
fourth, " " ordinary gasoline;  
fifth, " " kerosene;

At 600 r.p.m., first, " " cracked benzine;  
second, " " synthetic crude;  
third, " " cracked gasoline;  
fourth, " " ordinary gasoline;  
fifth, " " kerosene.

At 1000 r.p.m., first, " " cracked benzine;  
second, " " gasoline;  
third, " " common gasoline;  
fourth, " " synthetic crude;  
fifth, " " ordinary kerosene.

(This is the first point at which ordinary gasoline showed better than any of the cracked products, and then it only went ahead of the crude.)

At 1200 r.p.m., first, " " is cracked benzine;  
second, " " gasoline;  
third, " " ordinary gasoline;  
fourth, " " synthetic crude;  
fifth, " " ordinary kerosene.

It will be noted that once again gasoline moved up ahead of one of the cracked fuels, the crude.

In all cases the cracked benzine and cracked gasoline show power producing qualities superior to gasoline under exactly the same operating conditions. I might add here that in each test the engine was speeded up to 1000 r.p.m. with full load, at which point the carbureter was adjusted to get the maximum power, after which the test was started at 400 r.p.m. and continued up to 1200 r.p.m. with no further adjustments.

It is only fair to say that the kerosene test being made with a low compression head (about 10 lb. lower than the other head used) does not show favorably from the point of power developed, and as no special arrangements were made in the way of special vaporizer or heating apparatus other than the heated intake manifold, and a regular Stromberg carbureter used, the same as in the other tests, it is not quite to be expected that the showing would be near what the fuel is capable of producing when properly handled. The power curve is given, however, merely to show what kerosene would do in the engine with no special treatment to assist vaporization other than the heated manifold. The two reasons for the falling off of power in the kerosene test, outside of the low compression head, is the loss in volumetric efficiency owing to the use of the heated manifold and to the slow burning of only a part of the charge owing to the lack of complete gasification.

*Wreck of von Richthofen's Fokker triplane. This photograph was taken in front of a British hangar soon after the German air-fighter was shot, down*

## Extracts from the Diary of von Richthofen

The German Flier Has an Audience with His "All-Highest-War-Lord" in  
"The Holiest of Holies"—He Also Meets Hindenburg and  
Ludendorf and Is Much Impressed

### PART II

**EDITOR'S NOTE.**—When von Richthofen received the "Ordre pour la Merite" he was given command of an air squadron, afterwards known as the von Richthofen Circus. This gave him greater opportunities although he never reached his wished-for goal of a hundred victories, being killed while on a reconnaissance, with a record of eighty-two. His diary indicates that he was not altogether of the same mind as was his Imperial Master (at a later date), for he says, "The vicinity of Holland was disagreeable."

#### The Anti-Richthofen Circus

**T**HE English had hit upon a splendid joke. They intended to catch me or to bring me down. For that purpose they had actually organized a special squadron which flew about in that part which we frequented, as a rule. We discovered its particular aim by the fact that its aggressive activity was principally directed against our red machines.

I would say that all the machines of the whole squadron had been painted red because our English friends had by and by perceived that I was sitting in a blood-red box. Suddenly there were quite a lot of red machines, and the English opened their eyes wide when one fine day they saw a dozen red barges steaming along instead of a single one. Our new trick did not prevent them from making an attempt at attacking us. I preferred their new tactics. It is better that one's customers come to one's shop than to have to look for one's customers abroad.

*We flew to the lines, hoping to find our enemy. After*

*Captain Baron von Richthofen and his mascot dog "Moritz." The captain bought him from a Belgian for about \$1.25. "Moritz" acted as observer on one occasion. On another one of his ears was cut off by the propeller*

about twenty minutes the first arrived and attacked us. That had not happened to us for a long time. The English had abandoned their celebrated offensive tactics to some extent. They had found them somewhat too expensive.

Our aggressors were three Spads, one-seater machines. Their occupants thought themselves very superior to us because of the excellence of their apparatus. Wolff, my brother and I were flying together. We were three against three. That was as it ought to be.

Immediately at the beginning of the encounter the aggressive became a defensive. Our superiority became clear. I tackled my opponent and could see how my

machine fell like a stone, burning fiercely. It dropped into a morass. It was impossible to dig it out, and I have never discovered the name of my opponent. He had disappeared. Only the end of the tail was visible and marked the place where he had dug his own grave.

Simultaneously with me, Wolff and my brother had attacked their opponents and had forced them to land not far from my victim.

We were very happy, and flew home and hoped that the anti-Richthofen Squadron would often return to the fray.

#### I See Our All-Highest-War-Lord

I had shot down fifty aeroplanes. That was a nice number, but I would have preferred fifty-two. So I went up one day and had another two, although it was against orders.

I hope that I may live to celebrate a second lot of fifty.

In the evening of that particular day the telephone bell was ringing. Headquarters wished to speak to me. It seemed to me the height of fun to be connected with the holy of holies.

They gave me over the wire the cheerful news that His Majesty had expressed the wish to make my personal acquaintance, and had fixed the date for me. I had to make an appearance on the 2nd of May. The notification reached me on the 30th of April at nine o'clock in the evening. I should not have been able to fulfill the wish of our All-Highest War-Lord by taking the train. I therefore thought I would travel by air, especially as that mode of locomotion is far pleasanter. I started the next morning, not in my single-seater "le petit rouge," but in a big fat two-seater.

I took a seat at the rear, not at the stick. The man who had to do the flying was Lieut. Krefft, one of the officers of my squadron. He was just going on leave to recover his strength. So things fitted in admirably. He also got home quicker traveling by air and he preferred the trip by aeroplane.

I started on the journey rather hastily. The only luggage which I took with me was my toothbrush. Therefore, I had to dress for the journey in the clothes in which I was to appear at Headquarters. Now, a soldier does not carry with him many beautiful uniforms when he goes to war, and the scarcity of nice clothes is great in the case of a poor "Front-hog" like myself.

*A German picture of the von Richthofen Circus, ready for flight*

brother and Wolff handled each their own enemy. The usual waltzing began. We were circling around one another. A favorable wind came to our aid. It drove us fighting away from the Front in the direction of Germany.

My man was the first who fell. I suppose I had smashed up his engine. At any rate, he made up his mind to land. I no longer give pardon to anyone. Therefore I attacked him a second time and the consequence was that his whole machine went to pieces. His planes dropped off like pieces of paper and the body of the

*An Albatross 2-seater machine with a 200-hp. Mercedes engine*

My brother undertook the command of the aeroplane squadron in my absence. I took leave with a few words, for I hoped soon to recommence my work among those dear fellows.

The route was via Namur, Liège, Aix la Chapelle and Cologne. It was lovely for once to sail through the air without any thoughts of war. The weather was wonderful. We had rarely had such a perfect time. Probably the men at the Front would be extremely busy.

Soon our own captive balloons were lost to sight. The thunder of the Battle of Arras was only heard in the distance. Beneath us all was peace. We saw steamers on the rivers and fast trains on the railways. We overtook easily everything below. The wind was in our favor. The earth seemed as flat as a threshing floor. The beautiful mountains of the Meuse were not recognizable as mountains. One could not even trace them by their shadows, for the sun was right above us. We only knew that they were there, and with a little imagination we could hide ourselves in the cool glades of that delightful country.

It had become late. Clouds were gathering below and hid from us the earth. We flew on, taking our directions by means of the sun and the compass. The vicinity of *Holland* was disagreeable to us. So we thought we should

go lower in order to find out where we were. We went beneath the cloud and discovered that we were above Namur.

We then went on to Aix la Chapelle. We left that town to our left and about mid-day we reached Cologne. We both were in high spirits. We had before us a long leave of absence. The weather was beautiful. We had succeeded in all our undertakings. We had reached Cologne. We could be certain to get in time to Headquarters, whatever might happen.

Our coming had been announced in Cologne by telegram. People were looking out for us. On the previous day the newspapers had reported my fifty-second aerial victory. One can imagine what kind of a reception they had prepared for us.

We flew rather low in order not to lose the sensation that we were traveling among mountains. For, after all, the most beautiful part of the Rhine are the tree-clad hills, castles, etc. Of course, we could not make out individual houses. It is a pity that one cannot fly slowly as well as quickly. If it had been possible I would have flown quite slowly.

In the afternoon we arrived at Headquarters and were cordially received by some comrades with whom I was acquainted and who worked at the Holiest of Holies. I

absolutely pity those poor ink-spillers. They get only half the fun in war.

First of all I went to the General Commanding the Flying Services.

On the next morning came the great moment when I was to meet von Hindenburg and von Ludendorff. I had to wait for quite a while.

I should find it difficult to describe my encounter with these Generals. I saw von Hindenburg first and then von Ludendorff.

It is a weird feeling to be in the room where the fate of the world is decided. So I was quite glad when I was again outside the Holiest of Holies and when I had been commanded to lunch with His Majesty. The day was the day of my birth, and somebody had apparently told His Majesty. He congratulated me in the first place on my success, and in the second on my twenty-fifth birthday. At the same time he handed me a birthday present.

Formerly I would never have believed it possible that on my twenty-fifth birthday I would be sitting at the right of General Field Marshal von Hindenburg and that I would be mentioned by him in a speech.

On the day following I was to take mid-day dinner with the Kaiserin. And so I went to Homburg. Her Majesty also gave me a birthday present, and I had the great pleasure to show her how to start an aeroplane. In the evening I was again invited by General Field Marshal von Hindenburg. The day following I flew to Freiburg to do some shooting. At Freiburg I made use of a machine which was going to Berlin by air. In

Nuremberg I replenished my tanks with petrol. A thunderstorm was coming on. I was in a great hurry to get to Berlin. Various more or less interesting things awaited me there.

### The German Flying Machines

In the course of the war the German flying machines have experienced great changes. That is probably generally known. There is a colossal difference between a giant aeroplane and a chaser aeroplane.

The chaser plane is small, fast, quick at turning. It carries nothing apart from the pilot except machine-guns and ammunition.

The giant aeroplane is a colossus. Its only duty is to carry as much weight as possible, and it is able to do this owing to the huge surface of its planes. It is worth while to look at the gigantic English aeroplane which landed smoothly on the German side of the lines.

The giant aeroplane can carry an unbelievable weight. It will easily fly when lifting from three to five tons. Its petrol tanks look as large as railway wagons. In going about in such a colossus one has no longer the sensation that one is flying. One is driving. In going about in a giant aeroplane the control depends no longer on one's instinct, but on the technical instruments which one carries.

A giant aeroplane has a huge amount of horsepower. I do not know exactly how many, but they are in the thousands. The greater the horsepower the better. It

# Maybach 300-Hp. Aircraft Engine

## PART IV

### Results of Horsepower and Fuel Consumption Tests—Table of Engine Dimensions —General Analysis of Weights—Chemical and Physical Analyses of Material in Various Parts

**T**HE design of the equalizing baffle is shown in the perspective sketch, Fig. 30, which also shows the method of joining the ends of the induction pipes by rubber connections and band clips. Details of the six small primer valves fitted into the top of the induction pipe are also shown in the sketch.

The Maybach carbureter has been tested separately at the R. A. E. The results of these tests are shown graphically in the power and throttle curves (Fig. 32), together with a throttle curve diagram in comparison with the HC-8 Claudel-Hobson carbureter (Fig. 31).

#### Characteristic Curves

(a) **Throttle Curve.**—The throttle curve appears good. There is an excess of fuel at first which should give good acceleration, and there is a fair range, down from full throttle, of weak mixture suitable for cruising. Obviously, if it is considered desirable to have fuel and air control interconnected, any required throttle curve could be obtained, but it makes an unnecessarily complicated instrument. In this particular carbureter there are four ball universal joints and two sliding blocks.

(b) **Power Curves.**—The power curves are satisfactory, the mixture being practically constant over a large air speed range.

#### Resistance Test

The resistance is very high compared with carbureters of ordinary design. For purposes of comparison, the resistance of the HC-8 Claudel-Hobson carbureter is plotted on the same curve. The two carbureters are for engines of about the same

horsepower, and it will be seen that the resistance of the Maybach is about nine times that of the Claudel-Hobson.

#### Atomization Test

	Air Temper- ature	Air cu. ft. min.	Fuel pt./hr.	Deposit c.c./min.	Deposit % of fuel flow
Maybach .....	58°F.	195	51	32	6.62%
HC-8 Claudel-Hobson	58°F.	192	50	23	4.85%

The atomization of the Maybach is rather better than the Claudel-Hobson, but this is obtained by a high depression and high loss through the carbureter.

#### Conclusion

The carbureter seems satisfactory on throttle and power curves and atomization, but the resistance is very high and the weight excessive. The throttle curve is obtained by a complicated mechanical system which would need careful first adjustment and constant adjustment for wear. The air is taken in through the moving parts, and if any dust is present the mechanism is very liable to stick or to render the control very hard to operate.

#### Fuel Supply System

Fuel is supplied to the two carbureters by a small double-acting duplex fuel pump, which is attached to the rear end of the bottom half of the oil base, and is driven at half engine speed directly off the rear end of the main oil pump spindle, the fuel pump driving shaft being coupled to the oil pump

Fig. 28, left—Sectional view of fuel pump assembly. This is of the plunger type, having two opposite cylinders with a common plunger for both. Fig. 29, right—Perspective sketch of the fuel pump and its connections

Fig. 30—Inlet pipe baffle and priming caps

spindle by a dog clutch. The installation of the fuel pump is clearly shown in the general arrangement drawing of the engine, and the details of the fuel supply system are shown in the diagrammatic drawing (Fig. 19).

Regarding the installation of the fuel supply system to the fuel pump in the machine, it is assumed that the main fuel tank is provided with the ordinary float regulator, which has always been fitted inside the fuel tanks for regulating the supply through the fuel pumps; but owing to the fact that the machines from which these new Maybach engines were taken are completely destroyed no information regarding the construction and installation of the fuel tanks is available.

In the Rumpler machines fitted with the 260-hp. Mercedes engines two fuel tanks are fitted. The main tank is in the center of the fuselage behind the pilot's seat, and the auxiliary tank is situated under the pilot's seat.

#### Fuel Pump

The design of the compound fuel pump is shown in the sectional drawing (Fig. 28) and also in the sectional perspective sketch (Fig. 29).

The fuel pump consists of two opposed cylinders, in which a reciprocating plunger works, the ends of which operate as single-acting pumps. The pump plunger carries a yoke fitted with a sliding bush, which forms the crankpin bearing of the small pump crankshaft, driven, as already described, off the rear end of the oil pump spindle at half engine speed. The bore of the fuel pump plunger is 15 mm. and the stroke is 17 mm. The outer ends of the pump barrels are as shown and are fitted with threaded plugs, which form compression chambers.

The small non-return suction valves are situated directly above and below the two compression chambers, and the two fuel delivery valves are fitted above the compression chambers. The valves communicate with the compression chambers through small ports drilled in the pump barrel. Both the suction and delivery valves are of the poppet type, and each delivery valve is spring loaded by means of a small brass wire coiled spring.

The valves are supported in guides drilled in the unions which form valve boxes, and to which the fuel delivery pipes from the fuel tanks and to the carbureters are connected. The internal diameter of both these pipes is 10 mm.

It will be noticed that both the suction valves are fed by the same fuel supply pipe, as shown in the sketch.

The center portion of the fuel pump body, which is a gun-metal casting, forms a small circular crank chamber for the pump plunger and is fitted at the bottom with a detachable cover plate, which is secured by six set screws. The whole of the pump crank chamber is filled with oil under pressure from the main lubrication system, through an oil pipe connected to the center of the pump body casting, and leading from the rear end of the detachable main oil-lead pipe on the engine. By this means the efficient lubrication of the yoke and sliding bush and also of the seating of the pump plunger is assured.

#### R. A. E. Tests of Fuel Pump

Flow tests at three speeds with varying heads were taken; in order to represent working conditions in the engine, flow tests were also taken through jets similar to those employed on the engine.

The fuel pump was run at three speeds, viz.: 550, 800, and

1275 r.p.m., and the outlet pipe was connected to the pump against a variable head from zero to 6 lb. per square inch.

The maximum and minimum fuel delivery at these speeds are given in the following table:

R.P.M.	Maximum flow	Minimum flow
	Zero head	6 lb. head
550	300 pt. per hr.	167 pt. per hr.
800	422 pt. per hr.	264 pt. per hr.
1275	630 pt. per hr.	498 pt. per hr.

Curves of delivery against varying heads at constant speed are quite normal, and it is evident from them that the valves are acting well, and that the drop in delivery with increasing head resistance is due to cavitation. The pressure of the oil in the pump case during these tests varied between 15 and 20 lb. per square inch, and the leakage of oil and fuel past the end bearing of the pump spindle during one hour's run was approximately one pint.

#### Tests Through Engine Delivery Jets

In the engine the fuel is delivered through restricting jets (Fig. 25) into the constant-level tanks, which feed the jet chambers below, and are provided with overflows to the main fuel tank. In the tests both outlets of the pump were connected by a Y piece with one delivery pipe, the end of which was closed by a plate 1/16 in. in thickness, having two 0.07 in. diameter jet holes drilled through. The fuel pump was run at the three speeds as in the former tests, and the following results recorded of delivery and head resistance:

R.P.M.	Head resistance	Pints per hour
550	4.5 lb.	160
800	9 lb.	218
1275	25 lb.	360

#### Starting Gear

The principle of the Maybach starting gear is now so well known that only a brief description of the mechanism and a few details of the construction will be necessary. In the semi-diagrammatic cross-sectional drawing of the engine, Fig. 18, the working principles of this simple and distinctive starting mechanism are clearly shown. By the depression of the hand lever A on the induction side of the engine, all the tappets are lifted off their cams through the action of small lugs formed on the top of the tappets, which fit into slots cut in the tubular lay shafts BB. All the valves, both inlet and exhaust, are thus opened in the cylinder heads; and at the same time the hand lever A closes the shutter C in the exhaust manifold by the connection of levers shown in the drawing. The valves and exhaust shutter are then locked in this position by a peg, which is inserted in two holes D, which now coincide in the hand lever A. By the action of a large hand suction pump E in the pilot's seat, gas is then drawn into the combustion chambers through the inlet valves and induction pipe from the carbureters as indicated in the diagram. When the cylinders are charged the valves are returned to their normal positions by the withdrawal of the locking pin in the hand lever A, and simultaneously the free passage in the exhaust manifold is again opened by the shutter C. Ignition is then effected by means of a Bosch

Fig. 31—Carburetor test curves

hand-starter magneto in the pilot's seat. It will be noticed that the exhaust shutter lever is provided with a spring-loaded tie rod to insure a true seating for the shutter. In order to prevent the engine from being started until the hand lever has been released to its off position, the locking hole in the lever which takes the pin is made in such a way that only a special form of locking pin can be used. For this purpose the handle of the starting magneto is made easily detachable, and is used for the purpose of locking the hand lever A. It is thus practically impossible to cause ignition with the valves open and the exhaust passage closed, which, of course, would cause firing back into the carbureters, and probably also result in destroying the hand pump.

The Maybach engine (No. 1261), after several slight repairs had been carried out to the cylinders and propeller hub flange and coupling, was erected on a test bed, coupled to a Heenan and Froude dynamometer, and submitted to the following power and consumption tests, including a one hour's duration test at normal speed. The results of the calibration tests are as follows:

R.p.m. ....	1200	1300	1400	1500
B.-hp. ....	258	279	294.5	304.5
Brake, M.E.P. ....	120.5	120.3	118	113.9
Petrol consumption in				
pints / B.-hp. hour	.53	.52	.526	.545

The results of these tests are shown graphically on the diagram (Fig. 32).

#### One Hour Test

At the conclusion of the above tests a run of one hour's duration at normal revolutions (1400 r.p.m.) was carried out with the following results:

Average b.-hp. ....	290
Fuel consumption ....	20 gal. = .55 pints per b.-hp. hour
Oil consumption ....	11 pints = .038 pints per b.-hp. hour
Oil pressure ....	5 lb. sq. in.
Oil temperature ....	67 deg. C.
Water temperature (inlet) ....	57 deg. C.
Water temperature (outlet) ....	68 deg. C.

#### Valve Timing During Tests

Inlet	Exhaust
O. 8 deg. E.	O. 33 deg. E.
C. 35 deg. L.	C. 7 deg. L.
Magneto advance	38 deg. E.

Running was steady at all speeds between 900 and 1400 r.p.m. but, owing to the fact that the propeller hub flange on the crankshaft was damaged and was running slightly out of truth, the vibration became excessive above 1400 r.p.m. Considerable trouble was experienced with the water connection between the cylinders on the exhaust side. The running became unsteady below 900 r.p.m.

#### Distribution

Owing to the exhaust manifold being fitted as part of the engine starting gear, it was not possible to form an idea of the distribution. A diagram of the inlet and exhaust valve lift is shown graphically in Fig. 10.

Total reciprocating weight per cylinder .....	17.355 lb.	Length of connecting-rod (centers) ..	310.0 mm. = 12.20 in.
Weight per sq. in. piston area ....	0.538 lb.	Ratio. Connecting-rod/crank throw ..	3.445:1
Length of connecting-rod (centers) ..	310.0 mm. = 12.20 in.	Inertia, lb. sq. in. piston area, top center .....	137.0 lb. sq. in.
Ratio. Connecting-rod/crank throw ..	3.445:1	Inertia, lb. sq. in. piston area, bottom center .....	75.5 lb. sq. in.
Inertia, lb. sq. in. piston area, top center .....	137.0 lb. sq. in.		
Inertia, lb. sq. in. piston area, bottom center .....	75.5 lb. sq. in.		

Total cross sectional area, bottom of threads .....	4.520 sq. cm. = 0.70 sq. in.
Pitch of threads .....	1.5 mm.
Total load on bolts at 1400 r.p.m..	5824 lb.
Total load on bolts at 1600 r.p.m..	7602 lb.
Stress per sq. in. at 1400 r.p.m....	8320 lb. sq. in.
Stress per sq. in. at 1600 r.p.m....	10,860 lb. sq. in.
<b>CRANKSHAFT.</b>	
Number and type of main bearings	Seven bronze shell lined white metal
Cylinder centers .....	187.0 mm. = 7.362 in.
<b>Crank-pins.</b>	
Outside diameter .....	66.0 mm. = 2.598 in.
Inside diameter .....	38.0 mm. = 1.496 in.
Length .....	74.0 mm. = 2.913 in.
<b>Journals.</b>	
Outside diameter .....	66.0 mm. = 2.598 in.
Inside diameter .....	36.0 mm. = 1.417 in.
Length, propeller end .....	67.0 mm. = 2.638 in.
Length, rear end .....	67.0 mm. = 2.638 in.
Length, center .....	67.0 mm. = 2.638 in.
Length, intermediate .....	67.0 mm. = 2.638 in.
<b>Crank Webs.</b>	
Width .....	95.0 mm. = 3.740 in.
Thickness .....	23.0 mm. = 0.906 in.
Radius at ends of journals and crank-pins .....	4.5 mm. = 0.171 in.
Weight of complete shaft .....	99.9 lb.
<b>WORKING CLEARANCES.</b>	
Piston clearance, top (total) ....	0.75 mm. = 0.029 in.
Piston clearance, bottom (total) ..	0.25 mm. = 0.009 in.
Side clearance of connecting rod in piston (total) .....	11.8 mm. = 0.464 in.
Side clearance of big end on crank-pin (total) .....	0.44 mm. = 0.0173 in.
End clearance of crankshaft in main bearings .....	3.0 mm. = 0.118 in.
Clearance of valve stem in guide (inlet) .....	0.12 mm. = 0.00472 in.
Clearance of valve stem in guide (exhaust) .....	0.15 mm. = 0.0059 in.
<b>LUBRICATION SYSTEM.</b>	
Number and type of oil pumps ...	Three, rotary gear
Oil consumption per hour .....	11.0 pints
Oil consumption per b.-hp. hour ..	0.037 pints
Oil temperature .....	65 deg. C.
Oil pressure .....	5.0 lb. per sq. in.
Specific gravity of oil .....	0.899 s.p.g.
Ratio. Pump speed/crankshaft speed .....	1:2
Pump delivery (calculated at 100 per cent volumetric efficiency) ..	91 gal. per hour at normal engine revs.
<b>IGNITION.</b>	
Number and type of magnetos ...	Two Bosch
Firing sequence of engine .....	1-5-3-6-2-4
Ignition timing (fully advanced) ..	38 deg. early
Number of plugs per cylinder ....	Two
Type of plugs .....	Bosch 3 point
Ratio. Magneto speed/engine speed	1.5:1
<b>COOLING SYSTEM.</b>	
Number and type of water pumps.	One centrifugal
Diameter of inlet pipe .....	54.0 mm. = 2.126 in.
Diameter of outlet pipe .....	50.0 mm. = 1.966 in.
Diameter of rotor .....	111.0 mm. = 4.36 in.
Water capacity of one cylinder ...	1284.0 cu. cm.
Number and type of radiators ....	One, semicircular honey-comb
Ratio. Water pump speed/engine speed .....	2:1
Water temperature, inlet .....	57 deg. C.
Water temperature, outlet .....	68 deg. C.
<b>FUEL PUMP.</b>	
Number and type of fuel pumps..	One Maybach, double acting
Bore .....	15.0 mm. = 0.59 in.
Stroke .....	17 mm. = 0.66 in.

Normal delivery .....	264 pints per hour at 800 r.p.m.
Maximum delivery .....	630 pints per hour at 1275 r.p.m.
Ratio. Pump speed/crankshaft speed .....	1:2
<b>WEIGHTS.</b>	
Weight of complete engine, dry, with propeller boss and exhaust manifold .....	911 lb.
Weight per b.-hp. ditto .....	3.10 lb.
Weight of fuel per hour .....	139 lb.
Weight of oil per hour (s.p.g. 0.899) .....	12.36 lb.
Total weight of fuel and oil per hour .....	151.36 lb.
Gross weight of engine in running order, less fuel and oil (cooling system at 0.65 lb. per b.hp. ....	1102.0 lb.
Weight per b.-hp., ditto .....	3.79 lb.
Gross weight of engine in running order, with fuel and oil for six hours (tankage at 10 per cent weight of fuel and oil) .....	2100.9 lb.
Weight per b.-hp., ditto .....	7.14 lb.

## GENERAL ANALYSIS OF WEIGHTS

DESCRIPTION OF PART	No. per Set	Average Unit in Lbs.	Weight of Complete Set in Lbs.	Percentage of Total Weight
Cylinders, bare .....	6	32.75	196.50	21.59
Pistons, complete with rings and piston-pin set screws .....	6	12.30	73.80	8.11
Piston-pins .....	6	1.75	10.50	1.15
Connecting-rods and floating bushes.	6	8.93	49.12	5.39
Crankshaft, complete with oil rings.	1	99.90	99.90	10.98
Crankshaft extension, with nut and pin .....	1	4.00	4.00	0.44
Inlet valves .....	12	0.43	5.25	0.57
Exhaust valves .....	12	0.47	5.70	0.62
Inlet and exhaust valve springs ...	24	0.28	6.74	0.74
Inlet and exhaust valve collars, with cotters and locking device .....	24	0.12	3.00	0.32
Thrust, complete with ball races, propeller hub flange and camshaft driving sprocket .....	1	17.68	17.68	1.94
Camshafts .....	2	10.00	20.00	2.20
Overhead valve rockers, complete ..	12	1.08	12.99	1.42
Overhead rocker bearings, complete.	24	0.42	10.50	1.15
Valve tappets and guides .....	12	0.93	11.25	1.23
Crankcase, top half .....	1	94.30	94.30	10.36
Crankcase, bottom half .....	1	41.32	41.32	4.54
Bearing caps .....	6	2.68	16.12	1.77
Front bearing cap .....	1	5.56	5.56	0.61
Crankcase holding-down bolts, with clamps, nuts and washers .....	14	2.40	33.60	3.70
Induction pipe, complete .....	1	9.09	9.09	1.00
Propeller hub, with bolts and nuts..	1	21.00	21.00	2.30
Inlet valve push rods .....	6	0.48	2.90	0.32
Exhaust valve push rods .....	6	0.49	2.97	0.33
Inlet and exhaust stiffening plates..	2	2.00	4.00	0.44

DESCRIPTION OF PART	No. per Set	Average Unit in Lbs.	Weight of Complete Set in Lbs.	Percentage of Total Weight
Oil pumps, with drive and pipe.....	1	9.00	9.00	0.98
Rear cover plate .....	1	6.06	6.06	0.66
Front cover plate .....	1	4.00	4.00	0.44
Water pump, complete .....	1	8.50	8.50	0.93
Camshaft, oil and water pumps driving gears .....	1	13.65	13.65	1.50
Wireless clutch .....	1	5.06	5.06	0.55
Revolution counter gear .....	1	2.62	2.62	0.28

DESCRIPTION OF PART	No. per set	Average unit in lbs.	Weight of complete set in lbs.	Percentage of total weight
Machine-gun interrupter gear .....	1	1.82	1.82	0.20
Petrol pump .....	1	3.50	3.50	0.38
Magnetos .....	2	10.75	21.50	2.36
Magneto wiring .....	1	4.75	4.75	0.52
Oil pipes .....	1	4.00	4.00	0.44
Self-starter gear .....	1	6.00	6.00	0.66
Exhaust manifold .....	1	27.00	27.00	2.96
Carbureters .....	2	16.00	32.00	3.51
Miscellaneous .....			3.75	0.41
Total weight of engine .....			911.00	100.00

To Subscribers—Do not send money by ordinary mail. Remit by Draft, Post-Office or Express Money Order or Register your letter.

### HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Reconstruction

ONE of the first results of the cessation of hostilities has been a modification of the order curtailing the supply of materials to automobile manufacturers for the remainder of the year, and instead of our automobile plants being on a 100 per cent war basis on Jan. 1, next, as would have been the case had the war continued, they will be on a nearly 100 per cent peace work basis.

From the standpoint of the industry the war came to a close at an opportune time, just before all normal production had ceased. Some of the smaller concerns were still turning out automobiles at their usual rate, and for them there will be no conversion problem. All of those who have been either partly or wholly on war work will make the most strenuous efforts to get back to peace-time production in the shortest possible time.

There is always an advantage in being in the field early, but the importance of sound judgment and quick action probably never was greater than it is now. Production of several leading makers of auto-

mobiles has been discontinued entirely for some time and many other makers have been on a greatly reduced schedule. It is therefore not unreasonable to assume that a very considerable potential demand has grown up which will readily absorb the greatest possible production of the industry for many months to come.

There will, of course, be a certain class of prospective buyers which will hold back on account of the ruling prices, which are very materially higher than those of two years ago. These prices are based not so much on an abnormal relation between supply and demand as upon the high cost of labor and material. For some time at least the cost of both will remain unchanged, and though they are likely to drop gradually it is exceedingly doubtful whether we shall ever come back to the price levels of 1914.

Production cannot wait for these price adjustments. There are many urgent needs which it has been impossible to satisfy during the war period, and these will become a factor in the market first. In these cases prices will not stand in the way. When these demands have been met there may be an adjustment of prices, but this will hardly take place before the rush of spring business has subsided.

## Export Opportunities

WHILE endeavoring to meet the needs of our own country we must not shut our eyes to opportunities beyond our borders. All branches of our automotive industry have expanded enormously during the past 5 or 6 years and before very long they will not only be in position to take care of a vast amount of export business, but may even be dependent upon such business to keep going at anything like full capacity.

It is generally admitted that after the war competition in foreign markets will be fierce. But America was rapidly forging to the front even before the war, while during the early years of the conflict, when we were practically without competition, our automobile exports increased by leaps and bounds. During the early part of the reconstruction period we will be at a decided advantage over our European competitors who have been at war for more than 4 years and who have not been manufacturing any automobiles and motor trucks for private purposes. Moreover, the tremendous demand for cars and trucks in the late belligerent countries of Europe is not only the result of the enforced suspension of manufacture, but is also largely due to the heavy destruction of other means of transportation. Probably during the first year of peace much of the automobile manufacturing equipment in Europe will be devoted to salvaging military automobiles. Altogether it is quite evident that European manufacturers will be for a long time fully occupied with the demands made upon them by their home markets, leaving the field comparatively free to American makers to cultivate the markets of the smaller and non-industrial countries. It would certainly be a great blunder for our manufacturers to neglect this unparalleled opportunity.

## Industrial Demobilization

IT is even more difficult to demobilize a nation industrially than it is to demobilize an army. In fact one problem is a part of the other, because in demobilizing industry it must be left largely in a position to absorb the demobilized army.

Industry must be left in as busy a condition as it was during the war in order to accomplish this result, and in addition the industries which were non-essential for war, but highly essential for peace, must be brought back to a healthy life so that they can help take up the labor slack.

There must be no such mistake as to assume that we have learned to do perpetually without what were classed during wartime as non-essentials. All of civilization consists of these products. Better methods of transportation, better houses to work in, the tools and instruments of art and music and a long list of others, are all classed as non-essentials during war and yet these are the things which make it an advantage to live a life of civilization.

In our own industry we have a problem to face which is the reverse of what took place when this country entered the war. The Government needed us at that time and therefore gave us its assistance financially and in every other way to put our factories on a war basis.

The Government still needs us, but this time to help it solve the problem of placing our demobilized troops in valuable positions where they will contribute to the wealth of the nation by assisting in production.

Our industry is also in a position to render invaluable assistance in the work of reconstruction. We are going to have plenty to do, but we cannot throw ourselves from a war-time to a peace-time basis overnight, and it may be possible that our productive efforts will have to broaden to other lines than those handled during the war.

A factory which has its plans aligned with those of reconstruction, and whose products are attuned to the necessities of reconstruction times will succeed far better than one which attempts to take up its work where it left off when we entered the war.

A fresh set of plans will be necessary.

## Glare Control

ANYONE listening to the discussion on headlight glare control at the meeting of the Illuminating Engineering Society last week could not fail to form the opinion that the attempt of New York State to solve the headlight problem in a scientific manner had proven a complete fiasco. Moreover, it was plain that the failure was due not to incompetency of the men selected by the state authorities to work out the scientific elements of the problem, but to disinclination on the part of the authorities to be guided by the recommendations of experts. The charge was made that the test specifications were too technical and not sufficiently practical. As the specifications are based directly on road tests in which observations were made by a large number of observers of more or less night driving experience,

the charge of impracticability is ill-founded. There is certainly a very serious defect in the law, in that it permits the result of scientific tests to be set aside and decisions on the legality of certain anti-glare devices to be made on the basis of an individual road trial.

All tests on visibility and sensitiveness to glare have shown that there are enormous differences between individuals in this respect. The only approach to a scientific solution of the problem is to get a large number of observations with different observers and base the minimum illumination and maximum glare limits on these. After these values have been once determined, all further tests should be made in the laboratory, because there it is much easier to make the conditions in different tests uniform.

The subject of glare control is a most important and a most serious one. It is a matter of public safety. Serious and even fatal accidents due to improper road illumination are by no means rare, and while we cannot hope to eliminate them entirely, we should certainly do our best to reduce them to a minimum. On the other hand, commercial interests are likely to be affected by any attempted solution of the problem. But when it is a question of public safety against individual commercial interests the duty of the authorities is clear. All anti-glare devices are intended to increase the safety of night driving, but it is not sufficient that they improve matters as compared with the use of plain lens headlights. What is required of them is that they be sufficiently effective to render the light absolutely safe according to the results of tests.

A law which provides for scientific tests of headlights to determine their safety and then permits the Secretary of State to set the results aside and make his decision on the basis of a "judgment" or guess-work test is a snare and a delusion. It may take some moral courage to rigidly and impartially apply scientific test specifications to anti-glare devices, but the conditions demand that this should be done.

WITH the cessation of hostilities there must of necessity come a large contraction of aircraft production. At the present time airplanes are a Government monopoly, manufacturers being forbidden to produce for other than Government account. In order to prevent unnecessary confusion and hardship during the period of reconstruction it is now proposed that this monopoly, which was established for war purposes, should be maintained for the present. It is certainly a fortunate circumstance that the greater part of our aircraft work was given to firms in the automobile industry, which upon the return of peace can and will return to their old field of activity. In the placing of contracts the one great consideration was capacity for quick and efficient production, but facility of demobilization now looms up as another important reason why it was wise to entrust the automobile industry with the major part of the aircraft production program.

## No National Shows in 1919

### N. A. C. C. Votes Against New York and Chicago Events—Dealer Show Sentiment

WASHINGTON, Nov. 19—No National Automobile Shows this winter, but definite assurances that automobile production will resume normal capacity by May, 1919, were the chief features resulting from a meeting here yesterday by representatives of more than 100 automobile makers and members of the National Automobile Chamber of Commerce.

The vote against holding shows this winter was overwhelming. The manufacturers do not believe that they will be able to prepare such exhibitions in the short time allotted and do justice to the industry or properly and fittingly celebrate the military victory.

Although the national shows thus are no longer a possibility, sentiment among dealers is very strong for local exhibitions in the various large centers. President Vesper of the National Automobile Dealers' Association has placed himself and his association on record as favoring such shows. The Chicago Automobile Trade Association has sent a resolution to Washington urging that Chicago dealers have a hand in any shows which are put on in that city. Kansas City, Boston, Hartford and a number of other cities already are figuring on staging exhibitions. Pittsburgh has a show this week which is proving a wonderful stimulant to business.

The meeting developed that the production of passenger cars for 1918 will be 1,000,000, as compared with 2,000,000, which would have been the normal output had not the industry been curtailed 30 per cent last March and 50 per cent in July by the Government.

The manufacturers were unanimous in their belief that the industry will get back to normal and full production some time this coming spring.

Prices of cars will probably remain at present levels in most instances, it was stated, owing to high prices for materials and labor and also because reduced prices can only come with increased production. Truck production, greatly stimulated by the war, would have broken all output records had it not been for the curtailment of the industry, which made the output for the last half of the year the same as that for July to December, 1917. As the production for 1917 was 160,000 trucks, *this curtailment let the industry down*

to a production of 80,000 trucks for the last half of this year.

General discussions involved suggestions that the elimination of war work should progress with a constant view as to the effect on labor. Contracts, it was said, should be canceled in proportion to the growing capabilities of the plants to assimilate the war workers for peace time employment. A suggestion that the War Industries Board become a Peace Industries Board and control conversion from war to peace was approved and committees were appointed to co-operate in this work as follows:

**Passenger Car Committee**—R. B. Jackson, Hudson Motor Car Co.; A. I. Phelps, Dodge Bros., and H. H. Rice, Chevrolet Motor Car Co.

**Motor Truck Committee**—George M. Graham, Pierce-Arrow Motor Co.; Windsor T. White, White Co., and R. H. Boyston, Service Motor Truck Co.

Charles Clifton, president of the National Automobile Chamber of Commerce, presided at the meeting and practically every large motor car company was represented, including Packard, Pierce-Arrow, Locomobile, Paige-Detroit, Studebaker, Cadillac, Buick, Chevrolet, Chalmers, Peerless, Overland, Cole, Hudson, Hupmobile, Maxwell, Kissel, Reo, Mitchell, Briscoe, Liberty, Premier, Lexington, Oldsmobile and Stutz.

The possibility of export business was briefly discussed and it was stated that with reversion to the peace production large exports are anticipated. It has been impossible to fill the export orders during the past year due to lack of shipping facilities and there is large demand from foreign countries now awaiting fulfillments.

It was shown during the meeting that the automotive industry has contributed more toward victory than any other American industries excepting steel. It took on more than \$1,000,000,000 worth of war work for not only trucks, airplanes, passenger cars and trailers, but for such articles, not relating to the industry, as shells, helmets, submarine chasers and mine anchors. In addition it has given hundreds of technical men such as mechanical engineers, metallurgists, chemical engineers and production managers to the service, and thousands of chauffeurs, repairmen and special skilled mechanics.

### \$75,000,000 Worth of Airplane Contracts Cancelled

NEW YORK, Nov. 21—Government contracts for training and fighting planes amounting to approximately \$75,000,000 and held by the Curtiss Aeroplane & Motor Corp., Buffalo, have been cancelled. Late last week the company

## No Automotive Parts Taxation

### Senate Finance Committee Removes Clause from Pending Revenue Bill

WASHINGTON, Nov. 19—The Senate Finance Committee has removed from the pending Revenue Bill the floor sales tax and the stock tax on automobile and truck parts.

These taxes were to be applied against parts sold by or held in stock by dealers, and were regarded as very harmful as they would have applied to parts held in stock many years as well as those purchased recently. It is expected that the recommendation of the Senate Finance Committee in removing this tax from the Revenue Bill will be approved by Congress.

The National Automobile Chamber of Commerce now proposes to request Congress to remove the general tax against automobiles and trucks, including the 5 per cent sales tax, on the grounds that passenger cars and trucks have proved themselves essential during the war and further that the tax will be a brake on prompt resumption of peace-time capacity of production and sales.

discharged 6000 of its men. The cancelled contracts cover almost entirely orders for JN-4 training planes, an order for SE-5 fighting planes, which is understood originally to have been for 1000 and is now cut to 250 or approximately the number for which the company has parts on hand; the USB, the De Havilland 9 for the army, the HS-1 and the F-5 for the navy.

About the only government contracts which remain include orders for 144 training planes, 60 large flying boats and about 75 smaller boats. It seems likely in view of these cancellations that it may be necessary for a large part of the Buffalo plant to be shut down. Rumor has it that the Churchill plant may be used for the production of the new \$500 Overland car. Nothing official, however, has been given out.

### Will Recruit Workers for Peace Industry

WASHINGTON, Nov. 21—The Community Labor Board of the U. S. Employment Service, through which workers in non-war industries have been recruited for war industries, will now recruit war workers for peace industry and later aid the replacement of soldiers in peace industry. The Boards will work with the War Department and the War Industries Board, sending in weekly reports to the latter indicating local labor conditions.

## Two Makers Reduce Prices

Cadillac Cuts Off \$300 and Chevrolet from \$50 to \$145  
—Unrest Follows Move

### CADILLAC PRICES

Model	New Price	Old Price
2-Passenger	\$3,220	\$3,520
5-Passenger	3,220	3,520
7-Passenger	3,220	3,520
Victoria	3,615	3,915
Sedan, 5-pass.	4,090	4,390
Suburban, 7-pass.	4,340	4,640
Coupe	4,395	4,695
Landulet	4,495	4,795

### CHEVROLET PRICES

Model	New Price	Old Price
30-Roadster	\$715	\$845
Tour	735	865
Coupe	1110	1225
Sedan	1185	1325
Chassis	865	815
FA-Roadster	1045	1095
Tour	1045	1095
D8-Tour	1585	1685
F-Delivery		
Chassis	1325	1375
With body	1460	1510
Body and top	1545	1595

NEW YORK, Nov. 21—The General Motors Corp. is the first manufacturer to make public any alteration in price schedules of its products following the signing of the armistice. Cadillac prices have been reduced a straight \$300 and the prices of the various Chevrolet models have been reduced from \$50 to \$145.

The action of these two companies in reducing prices at this time has caused some little apprehension on the part of dealers who see harmful results to themselves because of the effect on the buying public which will naturally have a tendency to hold back on purchases now that the possibility of a general lowering of prices has become apparent. It is stated that dealers will be protected by the General Motors Corp.

Detroit manufacturers of cars and trucks state that the action of the General Motors Corp. will not have any effect on the prices of other cars. On the contrary, it is stated that instead of a reduction, it is more likely that there will be an upward trend. It is considered not unlikely that further increases in price will become effective before large production is again reached.

Other subsidiaries of the General Motors Corp. have not made any price changes and it is stated that none are contemplated for the immediate future. Announcement of the reduction in Cadillac prices was made through half page advertisements in the daily papers which stated that "prices will be brought at once to the figures which prevailed before Cadillac production was restricted by

governmental order. Decreased output resulting from governmental curtailment necessitated an increase of \$300 on all Cadillac models. This \$300 increase is now removed on the entire Cadillac line—the readjusted prices to be in effect as of 12 o'clock midnight, Saturday, Nov. 16." Herewith are the new and old prices of both Cadillac and Chevrolet lines.

### Prices of Commodities Will Remain as Established, Says Baruch

WASHINGTON, Nov. 21—Bernard M. Baruch stated to-day that the War Industries Board will continue all maximum prices on steel, copper, lumber and other commodities that have been established until the date originally set in the price fixing orders. As those dates approach, the board will consider the advice of extending the period of price control or removing that control. The tin-pooling agreement between the United States and the Allies, by which tin had been purchased for consumers in this country by the Government for 45 cents less than the market figures, will be continued until liquidation has been completed.

Mr. Baruch stated also that the automobile industry presented a memorandum through Hugh Chalmers informing him that it had gone forward with the plan of having the industry on a strictly war basis by January, but he now asks the board to allow the industry to retract its steps and go back to a peace basis.

The industry, Mr. Baruch said, asked a generous adjustment of war contracts, and he stated that while the War Industries Board has no control over these adjustments he is in favor of generous treatment and will urge that the cancellation of government contracts be slow and conservative. Mr. Baruch also advised the continuation of some permanent government agency, such as the Department of Commerce, to exercise control of industrial conservation for peace times, similar to the work performed by the War Industries Board during the war.

### Want Foreign Trade Investigations Enlarged

WASHINGTON, Nov. 20—The National Automobile Chamber of Commerce is preparing a presentation asking the House Committee on Appropriations to substantially increase the immediate appropriations for the Department of Commerce and the 1920 appropriations, to allow the department to make other investigations in all foreign countries of general business conditions and particularly the automobile business situation. The presentation will probably be ready within a few weeks.

## S. A. E. Meeting Dates Jan. 12-14

"Carry Through Meeting" to Be Followed by "Victory Dinner"—War Subjects

NEW YORK, Nov. 20—The Society of Automotive Engineers' winter meeting has been definitely placed on the calendar for Jan. 12-14, and is to be held in the auditorium of the Engineering Societies Building, New York. The "Carry Through Meeting" will be brought to a close with a "Victory Dinner" which is to be held at the Hotel Astor.

The meeting will be almost entirely devoted to war and post-war matters, and it is expected that the program of speakers will be of unparalleled interest because of the great events which have been taking place and because a number of men usually diffident about appearing in public have consented to address the sessions.

The views of many men who have been engaged abroad with our Army or that of our Allies will be given. There has never been a time when members of the S. A. E. were more actively engaged in professional work in so many lines of national importance to the world and to the automotive industry. The time is at hand to acquire broader views and entirely new conceptions of engineering subjects.

A number of matters relating intimately to the automotive industries which it is planned to cover include fuel, thermodynamics of the internal combustion engine, carburetion, including the use of heavy fuels and apparatus designed to compensate for variations in atmospheric density, etc. Tanks, types of post-war automobiles, radial-type aeronautic engines, relation in plane design of performance to weight, power and location of engine, and farm and road tractors will be discussed.

The recent intensive work in aircraft engines will be discussed and the lessons to be learned therefrom in automobile practice considered. The development of motor patrol boats will be covered as well as important features of stationary and farm engines and motorcycles for delivery and messenger service.

### Highways Convention Dec. 9-13

CHICAGO, Nov. 18—The date of the convention of the Highway Industries Association has been changed to Dec. 9 to 13. This was found necessary because of conflict with the meeting of the War Service Committee of the United States Chamber of Commerce.

## Petroleum Losses Enormous

13,000,000 Barrels Wasted at Refineries in Course of a Single Year

WASHINGTON, Nov. 18—More than 13,000,000 barrels of petroleum at a cost of at least \$29,000,000 has been lost each year through various oil losses at refineries, according to a statement issued to-day by the United States Fuel Administration.

The administration in its second letter calling the attention of oil producers and refiners to the need for conservation states that of 315,034,680 bbl. of crude oil received by refiners in 1917 13,073,789 bbl., or 4.1 per cent, were wasted. For the first 6 months of 1918 total deliveries to refiners amounted to 156,321,646 bbl., of which 6,893,140 bbl., or 4.40 per cent, was lost.

After pointing out these figures in its publicity the Fuel Administration requests the refiners to examine their traps, stop the leaks at the sources and carefully inspect the complete refineries to prohibit avoidable waste.

Following are the figures showing the oil lost in 1917 and the first 6 months of 1918:

Districts	Per Cent Loss 1917	Per Cent Loss Mo. 1918
New York, Philadelphia and Baltimore	7	6
Pennsylvania, New York, East Ohio and West Virginia	5	6
Western Ohio, Indiana, Illinois, Kentucky and Tennessee	6	9
Average per cent of the above districts	6	7
Oklahoma, Arkansas and Kansas	4	4
Texas and Louisiana	3	4
Average per cent Oklahoma, Arkansas, Kansas, Texas and Louisiana	3½	4
Colorado, Wyoming and Utah	7	7
Average per cent of the above districts being all east of California	5½	6
California, per cent	2	2

### Weekly Aircraft Production

WASHINGTON, Nov. 16—At the time that the armistice was signed 300 De Havilland planes and 20 Handley-Page bombing planes were being turned out weekly, according to a statement made yesterday by John D. Ryan, director of aircraft production. Mr. Ryan also told of a radio telephone which had been developed for and successfully used in the airplanes in the A. E. F., and by means of which aviators were in verbal communication with their squadron commanders.

"There are some details concerning this radio telephone which we cannot yet discuss," Mr. Ryan said, "but worked out during the months of experiment the device went into actual service some weeks ago and I have myself, standing on the ground, given orders to a squadron flying in the air and watched them manoeuvre accordingly. The transmission of the

voice is clear enough to be heard distinctly through the sound of the engine."

Mr. Ryan would not discuss the distance from which the radio telephone worked, but it is said to be a matter of some miles.

That radio telephones were a regular part of American aerial equipment has only been made public since the capture of a German order to the German air squadrons demanding that an American airplane with wireless telephone equipment be shot down and brought to the rear for examination.

### Nine Deaths at Flying Fields

WASHINGTON, Nov. 15—Nine deaths resulted in aviation training at fields in this country for the week ended Nov. 2. Three fatalities occurred at Barron Field, Everman, Texas; two at Selfridge Field, Mt. Clemens, Mich., and one each at Carlstrom Field, Arcadia, Fla.; Ellington Field, Houston, Texas; Rich Field, Waco, Texas, and Rockwell Field, San Diego, Cal.

For each fatality reported, a total of 2435 hours of flying, or 194,800 miles of air travel, is shown. There were no fatalities at the 21 other flying fields in the United States.

Two deaths were reported from Payne Field, West Point, Miss., as the result of accidents in flying during previous weeks. They are not included in the figures for the week ending Nov. 2.

### Training Departments for Aircraft Factories

WASHINGTON, Nov. 18—Effective training departments have now been established in all the leading aircraft factories, according to a statement made by Stanley Bradley, manager of the National Airplane Manufacturers' Association, to Director Charles Clayton, Training and Dilution Service. Some six months ago the Curtiss Aeroplane Corp., Buffalo; the Standard Aircraft Co., Elizabeth, N. J., and the Dayton Wright Airplane Co., Dayton, instituted training rooms which have since become models for other manufacturers. The Fisher Body Co., a long-established wood-working concern working upon airplanes, has a well organized and managed training room. The leading manufacturers engaged upon the production of air motors all recognize the importance of well developed training rooms.

### All Highway Projects Approved

WASHINGTON, Nov. 18—The United States Highway Council announced to-day that no further applications need be made to it for approval of highway projects, that previous disapprovals are revoked, and pending applications require no further action. Procedure in securing materials and transportation should follow normal practice, said officers of the Council. The removal of restrictions, however, does not affect highway bond issues, which are under control by the Capital Issues Committee. State highway departments will not be asked to submit programs for next year's work.

## Board to Co-operate on Contracts

Will Advise on Reduction or Termination After Consideration of Effect

WASHINGTON, Nov. 15—The War Industries Board has arranged with all war making agencies of the Government for co-operation in the cancellation of contracts to prevent possible confusion in industry.

The various Governmental agencies will notify the War Industries Board promptly of revisions and adjustments of war contracts in excess of \$100,000. Although it has never been the function of the War Industries Board to make contracts, and while it cannot assume responsibilities financially with regard to them, the board will undertake by advice and recommendation to control the situation so as to stabilize the flow of materials, labor and plant facilities back to peace channels. It will maintain contact with the Labor Department for the release of labor from war industries for peace pursuits.

Co-operation with the War Industries Board in its plans to prevent disturbances of labor and industry was ordered by Major General Goethals to-day. Purchase bureaus of the War Department were notified that the War Industries Board will approve or reject the reductions of orders or termination of contracts after consideration of:

- 1—The effect on the industry.
- 2—The effect on labor.
- 3—The effect on the locality.
- 4—The effect on the contractor.

The office of the Director of Purchase, Storage and Traffic, War Department, will be the point of contact between the War Department and the War Industries Board, and the cancellations or reductions of contracts will be approved or rejected by the Director of Purchase, Storage and Traffic after consultation with the War Industries Board.

Any orders placed, however, subsequent to Oct. 1, 1918, may be reduced, suspended or canceled without the approval of the Director of Purchase, Storage and Traffic. Also contracts and orders for less than \$25,000 can be canceled or reduced without the approval of the Director of Purchase, Storage and Traffic.

When contractors are willing to terminate contracts and state in writing that the termination will not be accompanied by disturbance of labor, the various purchasing divisions can terminate the contracts without the approval of the Director of Purchase, Storage and Traffic.

Contracts on which the work has not begun may be suspended without special approval and complete cancellations of all orders in an industry for a product may be made in all places at the same time without securing special approval, but notice must be given in advance of such action. Notice is to be given to

various contractors working on Government orders that no new labor should be engaged on such orders without the approval of the Procuring Office of the War Department and no new contracts are to be placed by contractors on suppliers or sub-contractors without the approval of the Procuring Office.

Following is the agreed statement sent out to all Section Chiefs of the War Industries Board with regard to the control of cancellation of contracts:

1. Herewith attached, marked "A," copy of the procedure that has been agreed upon with the Army on the above subject.
2. You will note it is clearly the intention that the Commodity Sections shall continue to be the point of contact with organized industry. The recommendation of the Commodity Sections is required before the Government purchasing agency proceeds with final negotiations for reducing requirements, in order to insure the best method of handling the reductions, considering the stability of all industries and localities.
3. It must be borne in mind that, although the Commodity Sections will in every way assist by making recommendations, as explained in the preceding paragraph, it is not proposed that the War Industries Board participate in negotiations or share in the responsibility for the details of the financial adjustment with contractors in such matters as disposition of raw materials on hand, damages, depreciation, etc. (For your information, however, we attached, marked "B," memorandum as to the steps taken by the War Department in this matter.)
4. Notwithstanding the definite distinction that has been made between the cancellations that require the concurrence of the War Industries Board, and those that do not require such concurrence, it is not the intention to preclude the possibility of the Government procurement departments obtaining assistance of the War Industries Board, Commodity Sections, whenever they can be of service, as explained in paragraph 2.
5. The Section Chiefs will be charged with the responsibility of notifying other sections of the War Industries Board of recommendations that may involve other contracts for component parts, and also of furnishing the executive secretary of the Requirements Division with proper data in order that the necessary records may center in one place.
6. Where there is an opportunity to discriminate between cancellations in various localities the Section Chief will secure the approval of the Director of Facilities before finally clearing the reduction or cancellation, in order that each locality may be protected, so far as possible, from an unnecessary number of cancellations at one time. In order that the Director of Facilities may have up-to-date information at all times, the executive sec-

## Ford Releases 25,000 Cars

### To Return Immediately to Quantity Production of 3000 Per Day

DETROIT, Nov. 19—The Ford Motor Co. is to return to a peace-time quantity production basis at the earliest possible moment. Already deliveries of cars have started to dealers, and it is expected that a production of 3000 cars per day will be reached very soon.

The Ford company has been producing cars for the Government for a long time, and it is because practically all of its Government contracts have been canceled that it is possible for the company to commence deliveries practically at once.

There are on hand 25,000 cars contracted for by the Government which are immediately released for dealers, and these will be apportioned throughout the United States.

The Ford shops are to return to a peace-time basis as rapidly as possible. The switch-over from manufacture of munitions and war supplies already has been started. While this is being completed the assembly units in various large cities heretofore used by the army will be utilized by the Ford company again almost at once.

### To Base Wages on Work, Not Sex

WASHINGTON, Nov. 18—The cessation of activities in military operations has created several problems regarding women in industries, according to Mary Van Kleeck, Department of Labor, and readjustment of conditions must be met

retary of the Requirements Division will notify him of all cancellations or reductions in such detail as he may require.

7. Whenever the Commodity Section, for any reason, deems it desirable that the transaction be considered in conference between the head of the department in which it originates and the chairman of the War Industries Board, the matter will be immediately called to the attention of the chairman.
8. Records of meetings and reports of Commodity Sections will be rendered as heretofore.—George N. Peek, Acting Vice-Chairman, War Industries Board.

"B" memorandum referred to in the above was one issued by Major General George W. Goethals, Director of Purchase, Storage and Traffic, through the War Industries Board and the Committee on Public Information last week, explaining the method of making adjustments in connection with "termination of contracts in the public interest" and previously announced in AUTOMOTIVE INDUSTRIES.

by various agencies of the Federal Government created for that purpose. The chief danger, said Miss Van Kleeck, is that women will remain in certain industries or be introduced into new ones on a lower wage basis than is paid to men. Consequently the Government will work for an established wage scale on the basis of occupation and not of sex. It also plans to guard against dangers to health of unsanitary working conditions, long hours and night employment during the reconstruction period. Although many women will be required to give up their positions with the return of soldiers, the Department of Labor believes that a number will be unable to withdraw entirely from gainful employment, and plans are also being considered to prevent such women suffering from lack of work.

### Allot Commodities for Export to Mexico

WASHINGTON, Nov. 18—In view of the increasing scarcity of many commodities of prime importance and necessity to the United States, and which at the same time this Government desires to share with Mexico, it has become necessary for the War Trade Board to allot such commodities for export to Mexico in order to equalize the distribution throughout the neighboring republic in an equitable and orderly manner consistent with the maximum amount of such commodities as can be spared.

Prospective importers in Mexico will facilitate the granting of licenses for export by the War Trade Board by presenting copies of their orders for supplies in triplicate to the nearest American consular officer, who will visé such orders and retain one copy for his file, returning the original and one copy to the applicant.

The importer should forward both viséed orders to the prospective exporter in the United States with instructions to attach the original viséed order to his application to the War Trade Board for an export license covering the commodity specified in such order, or file the original viséed order with the War Trade Board at Washington, D. C., and thereafter, in filing applications for licenses to export the commodities specified on such order, refer to the order by the consulate stamp serial number, which will be affixed to the order, and also the consular address, as "Mazatlan, Serial No. 4782."

In cases where American consular officers are not easily accessible to the prospective importer a statement to that effect should be attached to the order, giving the name of the nearest place where a consular officer is stationed.

### Railroad Lumber Gets Priority

WASHINGTON, Nov. 18—The War Industries Board has issued a ruling giving lumber orders for railroads the highest priority to permit construction which has heretofore been delayed by war requirements.

## Flying Fields to Be Closed

### Government Not to Demobilize Air Service—Expected to Develop Plane Industry

WASHINGTON, Nov. 19—Orders have been issued by the Division of Military Aeronautics for closing Selfridge Flying Field, Mt. Clemens, Mich.; Chanute Field, Rantoul, Ill., and Scott Field, Belleville, Ill., and the Air Service Mechanics' School, St. Paul. Arrangements have also been made giving cadets training for flying option of immediate discharge or completion of their training. If they are elected to continue their training they will be discharged when they graduate. Non-flying officers will be given the opportunity to complete flying training.

Although these plans indicate that the Government contemplates demobilization of the Army Air Service, officials declare that such assumption would be incorrect and that instead the Government expects to father the airplane industry and to promote it to the highest degree. Plans are being considered not only for some retention of the military Air Service, but also for development of peace time air activities.

Secretary Baker has stated that the Air Service is the field of military enterprise in which the greatest developments can be expected and it will without doubt continue to form an important part of the Army. Congress is expected to form recommendations shortly for continuing the aviation branches on a larger scale than the other arms of the service and for further improvements and developments of airplanes and engines.

At present flying is practically a Government monopoly, since the supply of lubricating oil, the castor bean oil, the flying training fields and many of the plants devoted to production are directly owned by the Government. The 32 flying fields fully equipped and built in this country are practically the only flying fields. The aviation schools controlled by the Government and capable of turning out 2000 men a month with ratings as Reserve Military Aviators form the only important flying training schools.

Outstanding contracts for military planes, which total about 30,000, it is expected will be cancelled. Many of the orders for these have been slowed down. The aircraft officials stated to-day that they will shortly make announcement of the exact suspensions, cancellations and continuations of orders.

#### To Sell Bosch and Eisemann

NEW YORK, Nov. 20—Both the Bosch Magneto Co., with plants in New York and Springfield, Mass., and the Eisemann Magneto Co., Bush Terminal, Brooklyn, N. Y., will be sold by the Alien Property Custodian early next week. It is not

anticipated, however, that this sale will bring about any change either in the personnel of the companies, in the production or in the product. It is stated that a certain portion of the stock in each company is owned by enemy aliens and it is this portion which will be sold. In the case of the Eisemann company, it is expected that present American holders of stock will bid in that portion now held by enemy aliens. It seems likely that the same procedure will obtain in the case of the Bosch Co. The statement to the effect that the Eisemann Co. was considering dissolution is branded as false and baseless by officials of the company. No such move is in contemplation, according to them. At the present time the Bosch Magneto Co. is operating three shifts a day and is heavily obligated for Government contracts. Recently the cancellation of the entire third series of 25,000 Class B trucks has necessitated a cancellation of magnetos for these vehicles. It is pointed out, however, that these are virtually standard instruments and that for this reason the Bosch company is not badly affected.

#### Overland Completes Moline Purchase

TOLEDO, Nov. 20—The Willys-Overland Co., which several weeks ago purchased control of the Moline Plow Co., has completed the deal. Of the \$10,000,000 common stock Willys-Overland acquires slightly over 82 per cent. In exchange it issues \$6,376,800 of the Willys-Overland preferred, \$3,105,900 Electric Auto-Lite Corp. preferred and \$1,649,200 Curtiss Airplane Corp. preferred. It is stated that the present daily production of 50 tractors will be increased to 125 as soon as release of materials is permitted.

#### F. T. C. Complains About Klaxon

WASHINGTON, D. C., Nov. 20—The Federal Trade Commission has issued a formal complaint against the Klaxon Co., Newark. The concern is charged with refusing to sell to dealers who insist on reselling to the public at prices they deem inadequate. In other words, the Federal Trade Commission believes that the Klaxon Co. is forcing retailers to maintain standard fixed resale prices on their products. The company is further charged with selling its horns on the condition, agreement or understanding that dealers shall at all times carry a minimum stock to the value of \$300. The company must appear before the Commission on Dec. 31 to answer the charge.

#### Pittsburgh Show Helps Trade

PITTSBURGH, Nov. 20—Pittsburgh is holding an automobile show this week and the benefit to business is being felt all along Motor Row. Sales began to pick up as soon as the show began to be talked about in the newspapers. The dealers plan to continue active selling during the winter to get their stocks well out of the way by the time new production comes through. Rain, influenza and other things have held the attendance down during the first part of the week.

## Adjustment of War Contracts

### Clearance Committee to Deal with Proposed Cancellations Suggested

WASHINGTON, Nov. 15—The earliest possible announcement of a comprehensive plan for adjustment of war contracts to prevent the possibility of business panic is urged on President Wilson by the War Service Executive Committee of the Chamber of Commerce of the United States in a letter made public yesterday. The letter, signed by Harry A. Wheeler, president of the chamber, suggests the immediate creation of a clearance committee to which all proposals to cancel contracts would be referred by the Government departments concerned.

#### President Considering Action

The committee expresses satisfaction that the President has indicated that he is giving earnest consideration to this subject and points out that its letter is for the purpose of calling attention to the serious situation that might be brought about if the utmost care is not exercised in dealing with the matter.

Cancellation of contracts in the last 10 days, it is pointed out, has caused a great deal of apprehension and disturbance and the fact is emphasized that great difficulties will have to be faced unless the transition from war to peace production is gradual. Cessation of work in the small number of instances where steps have already been taken, it is declared, is causing uneasiness among the country's banks which have extended credit to contractors and sub-contractors.

#### Reconstruction Most Important

Many phases of reconstruction will be taken up at the reconstruction conference of industrial war service committees called by the Chamber of Commerce of the United States early in December at Atlantic City. The sudden termination of the war makes reconstruction the most important business problem to-day. The 350 war service committees which will meet will be divided into 10 major groups to include food products, textiles, heat, light, power, metals, minerals other than iron and steel, iron and steel, wood and wood products, chemicals, leather, earthen products and industrial professions. Prior to the dividing of the committees into 10 major groups there will be 35 related groups, under which will be a group on oil and oil products, gas, engines, automobiles and accessories, steel and iron products, rubber, allied products and farm operating equipment.

#### Consider Price Stabilization

Questions to be taken up will include the best legal means to stabilize prices, labor finance, methods of Government contract cancellation, possible continuation of Government temporary war divisions during the period of reconstruction,

effect of war on business, raw material sources, possible benefits of continuation of war conservation, and possible continued control by the Government of raw materials.

#### New Air-Brake for Trucks and Trailers

NEW YORK, Nov. 19—A new air-brake for motor trucks and trailers, especially such as are engaged in inter-city transportation, has been developed by the Parker Air Appliance Co., Cleveland, O. These brakes were given a very severe tryout on a 2-ton Walter four-wheel-drive tractor and a 5-ton Troy trailer which carried a 7-ton load for the Good-year Tire & Rubber Co. from Akron to Boston recently. The outfit negotiated the roads over the Allegheny Mountains without mishap and the trial was considered satisfactory in every way.

Air pressure is pumped up by means of a 4-cylinder 1½ x 1¼ Kellogg air pump operated from the tractor engine. The outfit further comprises an unloader valve and two tanks, one on the tractor and the other on the trailer. Air pressure is carried at 90 lb. per square inch and the air passes to the tanks through the unloader valve. The brake cylinders measure 2¼ x 6 in. and are connected to the main tank through a distributing valve. There is also a valve on the trailer tank which is so arranged that the brakes are automatically set in case the trailer becomes uncoupled. The usefulness of this valve was shown on one occasion during the trip, when the trailer broke away from the tractor on a steep grade and was automatically stopped by its pneumatic brakes almost instantly. We expect to print a full illustrated description of these brakes in an early issue.

#### Bituminous Production Drops

WASHINGTON, Nov. 19—Bituminous coal production for the week ended Nov. 9 was 10,409,000 tons, an output lower than that of the corresponding period in 1917. This is the first time that production has fallen below the 1917 figures for a like period. Anthracite production totaled 87,000 tons, 5.8 per cent increase over the previous week. During the week ended Nov. 2 total loss by all causes from 100 per cent production was 20.4 per cent, of which labor shortage comprised 10.6 per cent, car shortage 5 per cent, mine disability 3.1 per cent and all other causes 1.7 per cent.

#### Show Managers to Meet

NEW YORK, Nov. 20—The National Association of Automobile Show Managers, representing all the principal dealer shows in the United States, will meet at the Hollenden Hotel, Cleveland, Nov. 25 and 26, to arrange schedules and to plan the resumption of shows, which had been called off because of the war. Thus far Minneapolis, Cleveland and Kansas City have definitely decided on shows and other cities are understood to have plans nearly completed. Minneapolis plans to duplicate the enormous automotive exposition that it held last winter.

## Copper Production Maintained

### Existing Levels of Prices and Wages to Be Undisturbed at Present

WASHINGTON, Nov. 16—The present rate of production and the existing levels of prices and wages in the copper industry will be maintained until Jan. 1 following a conference here to-day between members of the industry with the War Industries Board.

The present rate of production is to be maintained in the mines, smelters and refineries, continuous employment being thus insured during the first period of the transition from a war to a peace basis. The present level of prices of the metal and the existing wage scale are to be preserved. The War Industries Board or whichever other Government agency may be designated in the future will continue the regulation of prices and allocation of copper until the next meeting between the industry and the Government.

One of the allied governments within the last 24 hours has requested information on delivery of 200,000 tons of the commodity, which was accepted as a sign that the European demand would not only be large but immediate. Another point given consideration was the prospective requirements for civilian consumption, due to the curtailment of the productivity of many American industries for the last 18 months because of the needs of the war program, which have created a demand that should prove a factor in stabilizing conditions generally.

The civilian demands in Europe and elsewhere, held in check for more than 4 years, should work to the same end, it was thought, since America produces approximately 75 per cent of the world's copper supply. The reconstruction work in the belligerent countries was another point of discussion as well as the demand that Germany and her former allies will have to satisfy when she is again rehabilitated and has re-established her commercial relations with the rest of the world.

#### Hope for Tractor Concessions

CHICAGO, Nov. 19.—The hope of securing still further concessions in the way of materials and a virtual letting down of the bars on tractor production for the smaller and newer concerns in the business is the reason for an important meeting of the executive committee of the American Tractor Association which will be held in Chicago on Friday of this week.

Three important matters will be taken up by the committee.

First, the matter of materials and production. The recent decision of the Priorities Division of the War Industries Board that manufacturers of farm operative equipment may go ahead on a

basis of 87½ per cent of their 1918 schedules does not at all help the smaller manufacturers of tractors. They still are bound by the provisions of the revised ruling of Circular No. 35, permitting a maximum of 100 machines, which was recently announced by the Board, and which resulted from a visit of the War Service Committee of the association to Washington.

What the small companies want now is practically unrestricted production, so that they may go ahead with the development of their designs and the establishment of trade connections. Now that the war is over and there is an evident disposition on the part of the Government to let down the bars on essential industries the association hopes for favorable consideration.

The advisability of sending another committee to Washington within the next few days will be considered at the meeting of the committee and some decision will be reached.

Secondly, the committee will consider the feasibility of undertaking the backing of a permanent exposition of tractors and tractor parts, to occupy a floor in the Leiter Building, State and Van Buren Streets, Chicago.

Thirdly, the committee will consider and outline plans of future activity for the association.

The membership of the association continues to grow and now numbers 27 manufacturers of tractor parts, with two publications. The membership committee is actively at work and confidently predicts a membership of at least 100 by Jan. 1, 1919. The membership stands as follows at present:

#### The Membership List

Agrimotor, 20 E. Jackson Blvd., Chicago.  
American Tractor Corp., Peoria.  
Aulson Tractor Co., Waukegan.  
Geo. D. Bailey Co., Chicago.  
Baldwin Chain & Mfg. Co., Worcester.  
Beaver Mfg. Co., Milwaukee.  
Beltrall Tractor Co., St. Paul.  
Borg & Beck Co., Moline.  
Brewer Mosel Auto Co., Madison.  
Bullock Tractor Co., Chicago.  
Climax Engineering Co., Clinton.  
Coleman Tractor Co., Kansas City.  
Comet Automobile Co., Decatur.  
H. C. Domen Co., Oshkosh.  
P. J. Downes Co., Minneapolis.  
Erd Motor Co., Saginaw.  
Evans Mfg. Co., Hudson, Ohio.  
A. Finkl & Sons, Chicago.  
Foote Bros. Gear & Mach. Co., Chicago.  
Hooven Radiator Co., Chicago.  
Illinois Tractor Co., Bloomington.  
International Research Engineers, Los Angeles.  
Interstate Tractor Co., Waterloo.  
Kohl Tractor Co., Cleveland.  
Kokomo Electric Co., Kokomo.  
John Lauson Mfg. Co., New Holstein.  
Monarch Tractor Co., Watertown.  
Motor Age, Malters Bldg., Chicago.  
The Oakes Co., Indianapolis.  
John Obenberger Forge Co., West Allis, Wis.  
Perfex Radiator Co., Racine.  
Powell Tractor Co., Elwood, Ind.  
Reed Tractor Co., Kalamazoo.  
Reed & Glaser, Indianapolis.  
Shelby Tractor & Truck Co., Shelby.  
Splitdorf Electrical Co., Chicago.  
Square Turn Tractor Co., Norfolk, Neb.  
Star Tractor Co., Findley.  
Stone Tractor Mfg. Co., Texarkana.  
Turner Mfg. Co., Port Washington, Wis.  
U. S. Tractor & Machy. Co., Chicago.  
Victory Tractor Co., Greensburg, Ind.  
Wilcox Bennett Carburetor Co., Minneapolis.  
Wisconsin Farm Tractor Co., Sauk City.  
Wolverine Tractor Co., Saginaw.  
York Corrugating Co., York.  
Zelle Tractor Co., St. Louis.

## Shipping Urged for Latin America

### Pan-American Commerce Organization Asks Assignment of Vessels

WASHINGTON, Nov. 18—Immediate assignment of ships for trade with South and Central America has been suggested to the Shipping Board by the United States Section of the International High Commission and Pan-American Commerce Organization.

Secretary McAdoo, as chairman of the section, issued a statement yesterday emphasizing the need for ships for immediate Latin-American trade, and stated that official and commercial interests of North and South America demand better transportation facilities to insure closer commercial and financial relations.

"The United States Section of the International High Commission," said Mr. McAdoo, "has ventured to make to the Shipping Board a number of suggestions, some general and some specific, relating to the further prosecution of its constructive plans, as well as to the disposition of ships now in its control during their further operation by the board and otherwise. These suggestions include the immediate availability of ships for both east and west coasts of South America and the careful planning of freight allocation so as to avoid empty cargo space on south-bound trips.

"It will furthermore be necessary to develop a policy to meet the requirements of different industries and sections of both North and South America, in order that no undue hardships may be placed on any given industry or on any one section. Improvement of service for the West Indies and the avoidance of confusion and crowding of schedules by a careful adjustment of calling dates are also matters which have been submitted for the consideration of the Shipping Board.

"On July 19, 1915, I addressed a communication to the delegates assembled at the first Pan-American financial conference, emphasizing the necessity of united effort to provide adequately for the needs of their commerce and to enable them to avail themselves of the markets of the United States. Much has intervened since 1915 to delay and in many respects made more difficult the fulfillment of the task, but there is, however, a strong desire on the part of every agency of this government to contribute, within the measure of its power, toward giving to our Latin-American commerce the most adequate facilities."

### Good Roads Invaluable

WASHINGTON, Nov. 18—That good roads will be invaluable to the soldiers who will return from the army and who will be provided with farm land by the Department of the Interior was the state-

ment made in Congress by Congressman H. Z. Osborne yesterday in a general discussion of the Governmental provision for returning soldiers and sailors.

The Congressman pointed out that following the Civil War, contrary to the general pessimistic expectations, industry and agriculture both developed and expanded. At that time when the country had a population of 31 000,000 inhabitants the 2,000,000 soldiers who were mustered out found immediate employment.

Consequently it is expected that today with the population of 110,000 000, the mustering out of 3,500 000 soldiers will have no evil effect either upon industry or general labor conditions. Franklin K. Lane, Secretary of the Department of the Interior, in a letter to Congressman Osborne stated that the experience of wars proves that soldiers as a rule seek outdoor life following the wars and that this country has 230,657,755 acres of unappropriated land of which one-half is exceedingly cultivable.

It is planned to ask for legislation which will allow for the cultivation of this land by the soldiers who desire to till the soil, and in hand with this project comes the importance of sufficient farm tractors and good roads to allow for transportation by motor truck and passenger car. Consequently, said Congressman Osborn, there must be immediate legislation for provision of vast improvement and increase of transportation facilities. "especially the creation of a national system of good roads."

### Maximum Prices for Building Material

WASHINGTON, Nov. 18—The following maximum prices have been fixed by the War Industries Board, effective immediately and for the period ending Feb. 28, 1919, for the State of Virginia south of and including Petersburg and the States of North Carolina and South Carolina, for deliveries in full barge lots, f.o.b. point of origin, or f.o.b. cars plant, per ton of 2000 lb. net:

	Per Ton
Sand .....	\$0.50
Gravel .....	.95
Crushed Stone .....	1.30
Crushed granite .....	1.75

These figures do not include railroad ballast or screenings.

### May Re-Export to Bolivia

WASHINGTON, Nov. 15—Exporters shipping to Chile or Peru under license agreement not to re-export may re-export despite the agreement to Bolivia, according to an announcement by the War Trade Board to-day, provided that the re-export is not made to any person, firm or corporation on the enemy trading list.

### Can Use Oil for Roads

WASHINGTON, Nov. 16—The United States Fuel Administration has cancelled the order of last May restricting the sale and use of asphalt, road oil and other petroleum products for road purposes.

## Sufficient Cotton Airplane Fabric

### Domestic Production Now Averages About 1,200,000 Yards Monthly

WASHINGTON, Nov. 15—The production of American cotton airplane fabric is now averaging about 1,200 000 yards monthly, sufficient for all requirements, and capable of being largely increased if necessary. No more linen fabric is being imported from abroad for this purpose, and after the imported stock now on hand is exhausted, cotton fabric will be used exclusively in covering American airplane wings.

At the outbreak of the war in 1914 linen was the only material which had proved entirely satisfactory for covering airplane wings, the essential physical properties required being lightness in weight, proper absorption of dope, and strength and resistance to tear.

### Pre-War Production

The chief countries before the war producing flax for fine grades of linen were Belgium, Russia and Ireland. The Belgian supply was cut off from the Allies in 1914. The Russian flax was difficult to obtain and was later cut off entirely. In the meantime the consumption of linen for war purposes had increased enormously. By the spring of 1917, when the United States entered the war, the linen situation was very serious, and it was obvious that some substitute would have to be found.

In developing a cotton airplane fabric which would have the necessary qualities of the linen, the United States Government received the greatest assistance from the various cotton mills.

### Testing of Samples

Samples were made from cotton of many constructions and numbers of yarn, varying from No. 40 two-ply to No. 100 four-ply, the cloth having from 50 to 90 threads per inch. Yarns were in some cases mercerized under tension, and various twists were tried. Several cotton mills co-operated in this work.

When the new fabrics were secured, samples were put on airplanes, "doped" and varnished according to regulation practice, and tested in actual use at Langley Field and Pensacola. Flying tests were also made with several other varieties of fabric. The tests were for three months of service, averaging 10 hours per day. Members of the United States Air Service, members of the Foreign Flying Corps, and other experts assisted in the experiments. They reported that the cotton fabrics developed in the United States appeared to serve most favorably. Other very favorable reports have recently been received from tests made in Great Britain on American cloth sent over there.

After many experiments had been made the first contracts for 10,000 yards

each of cotton airplane fabric were placed in the middle of September, 1917. The results obtained with the first cotton fabric produced were satisfactory and it was decided to place further contracts for cotton airplane fabric.

#### Adopted Last November

Two fabrics were adopted, the specifications calling for a strength of not less than 80 lb. per in. in both warp and filling. The cotton used in the manufacture of the cotton airplane fabric had to be of a very long staple, and in November, 1917, the Air Service purchased 15,000 bales of long-staple Sea Island cotton.

The first quantity orders for cotton airplane fabric were placed in October and November, 1917, and were for 1,280,000 yards of grade A and 200,000 yards of grade B cotton airplane fabric. Deliveries of cotton airplane fabric started in January with the production of 173,000 yards. Production has gradually increased until at the present time 1,200,000 yards are being produced monthly.

Subsequent contracts have been let for cotton airplane fabric amounting to 11,513,084 yards. All of these later contracts, however, have been for grade A cotton fabric, as it now seems clear that this cloth is superior to the other.

While the cotton airplane fabric was at first only used for training planes, and the grade A standard linen fabric, which was imported from Great Britain, was used for combat planes, it was decided in April, 1918, that the grade A cotton fabric could be used for all types of planes.

#### Wages Increase; Workers Decrease

WASHINGTON, Nov. 16—Reports by automobile manufacturers to the Department of Labor show a continuation in wage increases and decreases in the number of workers employed. In July, 1918, 48 automobile makers employed 128,473 workers, with total payrolls of \$3,243,692 as compared with 127,962 workers at \$2,810,608 in July, 1917. In this instance the number of workers increased .04 per cent, while wages increased 15.4 per cent.

In July, 1918, 47 makers employed 113,449 workers at \$2,939,563 as compared with 118,007 workers at \$3,021,209 in June, 1918. Here there is a decrease of workers of 3.9 per cent and a decrease of wages of 2.7 per cent. A continuing decrease in the number of workers is shown by the fact that on July 31, 1918, 28 makers employed 80,290 workers as compared with 83,374 workers in 1917, and on July 31, 1918, 27 automobile manufacturers reported 67,409 employees as against 71,391 on June 30, 1918.

Two plants reported wage increases of 10 per cent, affecting 15 per cent of the employees in one plant and 50 per cent of the organization in the other. Another concern granted 10 per cent increases in some departments. The minimum wage in one plant was increased from 43 cents to 50 cents per hour. Another establishment allowed the entire organization the hourly rates overtime over 8 hours instead of 9 hours.

## Britain Plans for Canadian Trade

### Government Investigators Report Conditions to British Automotive Industry

MONTREAL, Nov. 18—When British firms are once again in a position to manufacture and to ship for overseas requirements, it is necessary that those that wish to regain their Canadian trade, or those wishing to enter the market in competition with the manufacturers of the United States, should be in a position to resume or to commence operations with a clear understanding of the task which lies before them.

To further this object His Majesty's trade commissioners have reported very fully to the British Society of Motor Manufacturers and Traders pointing out the difficulties and suggesting the best course of action to pursue. Extracts from the report follow:

If it is decided after careful investigation to deal strictly with Canadian buyers, the general methods, followed may be summed up as follows:

1. To send the firm's travelers from the United Kingdom at regular intervals to call upon buyers in Canada.
2. To sell only to jobbing or wholesale houses in Canada, under direct orders from them by mail or cable (based on samples, etc.).
3. To appoint a reliable Canadian commission agent for the whole of the Dominion, or agents for different provinces or districts, as circumstances may dictate. (The tendency in Canada is for commission agents to attempt to combine too many agencies. It is advisable to make a commission when appointing an agent that he shall not handle the agency of a competing firm, either American or British. Only agents of fairly long residence in the country should be appointed, and they should be familiar with every aspect of the trade, from the manufacturing to the selling end. Liberal salaries or commissions are necessary, the normal scale of wages being much higher than the United Kingdom, travelling expenses also must be liberal, on account of the great distances between important cities. Local agents are generally most favorably situated to deal with Provincial Governments, Municipalities, Government-owned railways, etc.).
4. To open a branch office or offices in Canada. (This method is only possible for firms whose output and prospective business will justify the annual expense of maintaining an office solely for their own use. When the class of trade calls for extended credit, such an office is advisable, a representative should be installed and an organization put into working order to take advantage of the situation immediately on the cessation of the war.)

#### One Wisconsin Farm in 44 Has a Tractor

MILWAUKEE, Nov. 18—The tractor was used on one out of every 44 farms of 100 or more acres in Wisconsin during the past year, according to figures compiled by the College of Agriculture, University of Wisconsin. The college credits the tractor with much of the \$300,000 in-

crease in the agricultural production of the State during the period. To supply operators for these tractors and the many new machines which are being purchased at this time and next spring, the college will give two courses in tractor and gas engine operation and maintenance. The first course starts Dec. 2. It is open to persons over 16 years of age, but the class will be limited to 50.

#### Post Office May Get Army Trucks and Planes

WASHINGTON, Nov. 15—Airplanes and motor trucks not needed by the Army after the conclusion of peace may be turned over to the Post Office Department by the Secretary of War under a provision of the post office appropriation bill for the present fiscal year. This was pointed out by post office officials in connection with discussion of the uses to which the large amount of motor equipment may be put. The airplanes, post office officials said, can be used in the proposed extensions of the aerial mail service, while motor trucks can be placed in service on the new parcel post routes which it is planned to establish.

#### Imports of Rubber

WASHINGTON, Nov. 18—The total exports of crude rubber from Para and Manaus, Brazil, according to a commerce report, during the month of August, 1918, amounted to 4,737,559 lb., compared with 7,587,087 lb. for the same month last year. The exports to the United States aggregated 3,911,945 lb., to Europe 703,000 lb. and to South Brazil 112,605 lb., compared with 4,598,307 and 2,988,780 lb. to the United States and Europe, respectively, last year.

The following table shows the several grades of rubber exported during August, 1918:

	From Para—		From Manaus	
	To United States, Pounds	To Europe, Pounds	To So. Brazil, Pounds	To United States, Pounds
Fine ...	956,074	324,712	112,605	\$16,142
Medium ...	48,670	16,405	.....	96,998
Coarse ...	440,354	198,691	.....	249,882
Caucho ...	404,728	163,201	.....	939,104
Total ...	1,809,824	703,009	112,605	2,102,121

#### Washington Sees a Handley-Page

WASHINGTON, Nov. 15—The first Handley-Page bombing plane exhibited in Washington for the inspection of the Air Service arrived yesterday, carrying seven passengers. The plane, which is from Mineola, Long Island, has a wing spread of 103 ft., weighs 14,000 lb. loaded, and has a capacity of 400 gal. of fuel. It is equipped with Liberty engines.

#### Vessels May Take Deck Cargoes

WASHINGTON, Nov. 18—Any unarmed vessels without convoys sailing from Atlantic or Gulf ports can now carry deck cargoes, according to a new ruling by the War Trade Board, which has rescinded the previous rulings preventing deck cargoes on such vessels.

## Open Market Now for Steel

### Preference and Priority Abolished—Makers Can Buy Supplies They Need

WASHINGTON, Nov. 21—Passenger car, truck and motorcycle makers can go into the open market and purchase materials and supplies at will, and the makers of steel and other necessary automotive materials can supply these in any quantities and to any purchasers as a result of the cancellation of all outstanding priority ratings and the preference list by the Priorities Division of the War Industries Board.

The order becomes effective Nov. 22. The preference list was a priority compilation of concerns engaged in war or other very essential work, used by the War Industries Board for determining the importance of industries and the granting of priorities.

Although the list did not name truck and motorcycle makers, the Priority Board gave recognition to those industries by granting certain priority rights.

With the cancellation of this list, which is completely terminated with the exception of Priority 4 for the navy, Emergency Fleet Corp, railroads, telegraph and telephone companies, the automobile, truck and other automotive industries can secure all necessary materials on an equal basis with all other industries.

Applications for priority certificates can still be made by various companies, but will only be granted when the need is especially urgent and clearly in the public interest. Production of food, which includes the manufacture of farm tractor, production of petroleum and the operation of mines and plants for reducing ores and metals are recognized as especially important and will be granted priorities when necessary.

The War Industries Board emphasizes the fact that the cancellation of the priority list has nothing whatever to do with cancellations of war contracts, as the priority list is entirely disconnected from the placing of orders.

#### Allow Floor Tax on Leased Cars

WASHINGTON, Nov. 20—The Senate Finance Committee has included a provision in the Revenue Bill allowing dealers to collect the floor tax on cars which are first leased and later sold. A ruling has also been made that in the case where a car is leased and is returned by the prospective purchaser without the closing of the sale, the car can be considered "used" and the floor tax will not apply upon its sale at a later time. This ruling and the provision are the result of work by the National Automobile Chamber of Commerce.

Many dealers in this country and particularly those in the West sell cars on what is known as the leasing plan where by a prospective purchaser leases an au-

tomobile by the month paying monthly rentals and at the expiration of 10 months owns the car. The provisions of the first Revenue Bill, which included a 1½ per cent floor tax, aroused the question as to whether the dealer or the renter owned the car and further the dealers objected to paying the tax on the car which had been returned by the renter, stating that this was being sold as a second-hand vehicle.

The ruling definitely decided that the dealer was always the owner of the car until the title passed into the hands of the renter, but the amendment provides the dealer can charge the renter with the floor tax when he takes title to the machine. If the car is returned by the renter prior to the 10 months it is classed as a second-hand vehicle and taxes do not apply to it. The tax under the provision of the new Revenue Bill is 5 per cent, as has been announced previously.

#### Deny Rumor of Labor Layoff

DETROIT, Nov. 20—Reports from Washington after the National Automobile Chamber of Commerce meeting Tuesday, stating that large forces of men had been laid off in the factories of the Chalmers Motor Co., Detroit, and Buick Motor Co., Flint, were denied by officials of both companies to-day. They declare that there is no truth in the statement and that no authorized representative made them. Walter E. Flanders, of the Chalmers, stated that the company is operating two shifts of 8 hours each on war contracts and that this will continue indefinitely. Buick makes emphatic denial of the Washington story. E. T. Strong, general sales manager, said production is going on the same as usual at the factory. Of course, there have been some slight changes made in the shifts, but this is not as a result of the armistice.

#### Detroit Trade Wants a Show

DETROIT, Nov. 20—The Detroit Automobile Dealers' Association desires to hold a 1919 automobile show, preferably in January, though the members of the association at a meeting Tuesday night were unable to decide just what action should be taken. Some were for holding the show in January while others insisted on a February date and some thought it would be better to stage the show as late as April. With no shows this winter in New York and Chicago, the Detroit dealers are hopeful of making their exhibit national in scope. As usual Detroit is without a suitable building in which to hold a show. Before a date can be set it will be necessary to locate a building.

#### Parkers Sell Rust-Proof Interest

DETROIT, Nov. 19—Clark W. and Wyman C. Parker have disposed of their entire stock holdings in the Parker Rust-Proof Co. of America, and the former has resigned his position as a director of that concern and is no longer connected with it in any capacity. Their stock interests have been acquired by A. V. Foster of Spitzer, Rorick & Co., Toledo.

## After-War Problems to Be Discussed

### Comprehensive Program Is Scheduled for Reconstruction Conference

WASHINGTON, D. C., Nov. 20.—The Reconstruction Conference of Industrial War Service Committees called by the Chamber of Commerce of the United States for December 3, 4, 5 and 6, at Atlantic City, N. J., promises to be one of the most important gatherings of its kind ever held. Although the program for the conference has not been entirely completed, enough of the details have been worked out to indicate the comprehensive way in which the conference will approach the problem of reconstruction. On December 3, the first day of the conference, the 350 war service committees meeting separately will take up questions of special interest to their own industries. At these meetings there will be formulated the policies of the industries represented by the committees and resolutions which individual crafts desire to present during the conference.

For the purpose of facilitating discussion and co-ordinating the ideas of the various industries represented, the war service committees after meeting separately will gather together in 35 related groups. Afterwards these related groups will assemble as 10 major groups representing the ten primary industries within the United States.

The 10 groups as defined for the purpose of the conference are as follows:

Food Products	Wood and Wood
Textiles	Products
Heat, Light and	Chemicals
Power	Leather
Metals and Minerals	Earthen Products
Iron and Steel	Industrial Professions

The 35 related groups, in which some changes will be made before the final program is approved, are outlined as follows:

Food Production and Exchanges  
Food Conversion—Milling—Canning—Meat  
Packers By-Products  
Oil and Oil Products (Animal and Vegetable)  
Coal and Coke  
Public Utilities  
Oil and Oil Products (Mineral)  
Gas Motors, Automobiles, Engines and the like  
Steel and Iron Production, Rolled and Drawn  
Steel and Iron Products, Fabricated or Manufactured  
Steel and Iron Products, Cast  
Machinery, Tools and Power Equipment  
Hardware  
Building Materials, except those otherwise specified  
Farm Operating Equipment—Agricultural Implements, Fences, etc.  
Non-Ferrous Metals, Brass and Alloys  
Gold, Silver, Precious and Alloyed Metals  
Wool and Wool Products  
Cotton and Jute Products  
Silk and Silk Products  
Rubber, Saturated and Coated Textiles and Allied Products  
Lumber and Products, except those specifically comprised in other related groups

## Subjects Suggested for Consideration and Discussion at the Meeting of Your Individual War Service Committee

- What legal methods or means could be introduced in the craft to better stabilize prices, during the Reconstruction Period, affected by the following:
  - Inventories on hand.
  - Orders placed at war prices but not delivered.
  - Labor costs and conditions.
  - Increased taxes.
  - Increased rates of interest.
  - An estimated increased demand for non-war materials restricted during the war period.
- Will an increased production of your commodity increase the price of material or labor, or will a controlled redistribution of material and labor from war industries prevent such an increase?
- Discuss the practice of the sale of commodities at a price less than the cost of production. Its injury and disturbance on the industries and the ultimate consumer. What methods would you suggest to remedy this evil?
  - If the Government sees fit to dispose of used materials and products in the open market, what effect will it have on your production and the sale of new goods? At home? Abroad?
  - If it is not advisable for the Government to sell these goods on hand, either home or abroad, what shall it do with them?
  - In this connection, what point of contact should business interests have with the Governmental departments in the sale or disposition of these various commodities?
- What is the estimated amount of labor, skilled and unskilled, male and female, required for the estimated 1919 production? What is to be the source of labor? How much must be moved? How much have you lost to war industries?
- What is your financing problem during the Reconstruction Period? Do you recommend Governmental aid? Is financial legislation needed? Should the Capital Issues Committee be continued during this period?
 

In this connection discuss and recommend what financial obligations, if any, the industries in your craft are under to the Government for moneys advanced for buildings, machinery or as loans or security for Government contracts. How are these to be liquidated or adjusted?
- What method would you suggest for the cancellation of Government war orders with your craft, that would create the least amount of hardship on the industries and permit a readjustment to normal commercial conditions?
- On undelivered Government orders, what percentage of materials on hand, supplied either by the Government or purchased by you for these Government orders, can be utilized by your craft for commercial purposes during 1919? What disposition shall be made of those not usable?
- Have you any suggestions to make as to the continuation of the War Industries Board or any of its divisions, or any other Governmental departments during the period of Reconstruction? Such Board or departments to have the authority to control materials and regulate prices. If so, for what period?
- What intelligent control of materials during the Reconstruction Period could the War Service Committee suggest which would prevent an over or under supply and avoid a demoralization of the market? Should this be controlled by the crafts or by a Governmental agency?
- What effect had the war program on your output? Was it increased or decreased? Will there be an increased demand during the Reconstruction Period? If materials are uncontrolled will prices go up or down?
- What is the estimated tonnage or unit of production of your raw materials for 1918? For 1919? Estimated demand for foreign commerce for 1919?
- What is the estimated demand for your finished product for 1919? How does this compare with the average demand per annum in weight or unit of production for a five year period immediately prior to 1914?
- Sources of your raw materials? Domestic or imported? If domestic, can railroad cross hauling be eliminated by purchasing nearer your plants? Causes of cross hauling? If imported, at what ports? Would other ports of entry be more advantageous? What ports and why?
- The value of a uniform method of cost accounting for the individual manufacturer and the craft as a whole.
- What suggestions of the Conservation Division made to your craft might, with financial profit to your craft, be continued during the readjustment period? Is it possible to maintain a conservation schedule after the war, without legislative authority?
- What methods and practices, other than those your craft has already introduced, would simplify production, save materials, eliminate wasteful practices, reduce the number of styles, without destroying individual creativeness?
- What propaganda is necessary to educate the retailer and consumer to accept these eliminations and simplifications, and what plans might be arranged for better functioning with committees of jobbers and retailers handling your commodities?
- What percentage of the commodities represented by your war service committee was produced in the United States before the war and what percentage imported? What suggestion have you to make for increased production for domestic and foreign commerce?
- What effect will foreign competition have on your business? Will it increase or decrease your production?
- What is the underlying reason for the importation of foreign-made goods—Prices? Styles? Label? Quality? Design? Or excess demand over domestic supply?
- What disposition should be made by the Government of her Merchant Marine?
- What steps have you taken, or do you propose to take, for the entire craft to take advantage of the Webb-Pomerene Bill, which allows combination for foreign trade, or have you other plans? What do you suggest as the best means of financing foreign credits? What percentage of the foreign commerce heretofore controlled by Germany can your craft obtain and supply?
- What study is necessary, and what suggestions have you to make, in order to determine what are the needs of our allied countries for rehabilitation, and how far can you supply both raw and finished materials until they have been rehabilitated?
- Has your craft been solicited by, or are you soliciting, foreign countries to supply these materials for rehabilitation purposes? If solicited, does this come from the Allies, or from neutral or enemy countries?
- Would you recommend the appointment of a committee of United States manufacturers to confer with similar committees from our Allies, to learn of their plans for protecting industry during the Reconstruction Period? Also to obtain information regarding commodities and supplies needed by them and ourselves during this period.
- When the demobilization of military forces takes place, how can these men best be returned to their former industrial pursuits, and how will it affect your labor situation?
 

In this connection, how closely should the Conference work with the Governmental bodies in the study of demobilization plans?
- What suggestions have you to make to encourage and stimulate public work, such as the building of roads, pavements, water and sewer extensions, the construction of public buildings, school houses, etc.? What effect will it have on the labor market?
 

In this connection consider the building program in the United States and especially the utilization or destruction of new plants built for war purposes. Location of convalescent and reconstruction hospitals near industrial centers so that these men can be trained in the factories nearest to the hospitals without creating new vocational schools.

Wood-pulp and Paper Products  
 Printing, Engraving, Lithographing and Materials  
 Office, Store and Bank Fixtures, Equipment and Office Devices  
 Furniture  
 Acids, Heavy Chemicals, Miscellaneous and Industrial Chemicals, Paints and Pigments, Artificial Dyes and Intermediates, Tanning Materials and Natural Dyestuffs  
 Fertilizer and Fertilizer Chemicals  
 Boots and Shoes, Harness and Saddlery  
 Tanning and Leather Raw Stock  
 Clay and Clay Products, such as brick, tile and semi-porcelain clay  
 Sand, Lime and Stone Cement (except when otherwise specified)  
 Distribution, Wholesale and Retail, not manufacturers who distribute direct  
 Engineers, Architects and Accountants  
 Medical Industries (Drugs and Pharmaceutical Chemicals, including Medicinal Chemicals, Pharmaceutical Chemicals, Biological Products, Essential Oils, Plasters, Dental Supplies, Surgical Instruments)  
 Trade Papers, Magazines, Newspapers and House Organ editors

A list of twenty-five questions has been sent out by the War Service Executive Committee to the members of all war service committees for use as a basis for the deliberations of the individual war service committees at their first meeting. These suggestions are not considered exhaustive and members of the committees have been requested to present other subjects which they think should be discussed. The subjects are given above.

### Good Prospects in Argentina

BUENOS AIRES, Oct. 11—Frederico A. Sarra Lima of the firm of Buxton, Olditch & Co., importers of automotive products, considers the prospects for the coming summer's trade exceedingly good provided conditions become more nearly normal. He states that owing to restricted production there are not a sufficient number of cars to meet the demand, that unsatisfactory shipping conditions

prevented development of the truck business and that unless there is some change in the present situation he does not think that the various distributors will be able to fill more than 50 per cent of their orders. Mr. Lima anticipates a demand for the smaller types of farm tractor, although but little has been done in this direction so far.

### Maxwell Passes Dividend

DETROIT, Nov. 21—The Maxwell Motor Co. has passed the dividend on its first preferred stock for the quarter ending Dec. 31, 1918. The reason ascribed is that the company has been operating 80 per cent of its capacity on war work, which has necessitated carrying a large inventory. A substantial modification or revision of war orders is anticipated which will necessitate a liquidation of the present inventory and conversion to peacetime basis.

## Score Application of Headlight Law

### New York Ordinance Held Not Entirely Satisfactory—Arbitrary Rulings by Secretary of State Defeat Purpose of Measure

NEW YORK, Nov. 15—That the new New York State Law providing for scientific tests of headlight glare control devices has not proved entirely satisfactory in its application was evident from the discussion held last night at the meeting of the Illuminating Engineering Society at the Engineering Societies' Building, this city. The program of the meeting called for a discussion of the 1917-1918 report of the Committee on Automobile Headlight Specifications.

Dr. Sharp gave a review of the work done by the committee during the past year. He said the work of this committee had culminated in the draft of specifications for laboratory tests required by the laws of the State of New York. He brought out the fact that while there are two points covered in the law, namely, the control of glare and the insurance of sufficient road illumination, the control of glare was the primary and most important object. Each driver has more or less control over his own light, but he cannot control the light from approaching vehicles and he is entitled to protection of the law against blinding glare emitted by them.

#### The General Requirements

The committee in its work had the headlight laws of several other states to guide it. Most of these called for elimination of all direct rays above a line 42 in. above the road surface, at a distance of 75 ft. ahead of the car. This specification led to the production of various devices, having the effect of throwing the beam of light downward. Other devices produced to bring lamps within the requirements of the law had the effect of scattering the rays.

The committee came to the conclusion that the point of observation, 75 ft. directly ahead of the car and 42 in. above the road surface, was not well chosen. They found that the average height of the eyes of a person on the road, whether walking or driving, is 5 ft. Moreover, in meeting another car the driver has to turn out and when he is close to it he is not in a direct line with the oncoming car but about 7 ft. to the left of it. In this position also he must not be annoyed by glare and it was necessary to provide, therefore, for measurements at three points.

In the first place to insure adequate road illumination, it was specified that at a distance of 200 ft. directly in front of the vehicle, and at some point between the road surface and a line 42 in. above it, the illumination must not be less than 1200 apparent candlepower. The object of the second measurement specified was to insure against blinding glare from the lamps directly in the path of the car. This measurement was to be taken at a distance of 100 ft. from the car and at a height of 60 in. above the road surface,

and it was specified that the intensity of illumination at this point should not be more than 2400 apparent candlepower.

To insure against glare in the path of oncoming cars that have swung to one side, a third test was specified. At a distance of 100 ft. ahead of the car, 7 ft. to the left of the axis thereof, and at 60 in. or more above the road, the intensity of illumination must not be more than 800 apparent candlepower. The purpose of the laboratory test, Dr. Sharp said, was to enable one to determine under easily reproducible conditions, whether the illumination obtained from a pair of headlamps was in conformity with the law.

#### Test Apparatus Demonstrated

Mr. Little, who had charge of the tests made by the committee, gave a demonstration of the apparatus used. A pair of headlamps was rigged up in the rear part of the room, and was adjusted to throw a beam of light on a screen on the stage. He showed how axial adjustment of the bulb would reduce and enlarge the beam, and if carried sufficiently far produce a dark spot at the center of same. He also showed the effect on the shape of the beam of placing the bulb outside the axis of the reflector.

L. B. Marks said that the committee had the laws of eight states to serve them as patterns. New York State already had an anti-glare law in 1917, but this was a dead letter. It was urged upon Senator Hewitt, who introduced the bill embodying the present law, that numerical measures should be inserted as to what constituted dangerous glare and sufficient road illumination.

#### Effect of Arbitrary Rulings

Some time ago a statement was given out by the office of the Secretary of State to the effect that between 45 and 50 different lenses had been tested by the laboratories under the direction of the Secretary of State. From a perusal of the report on these tests, issued by the Secretary of State, it was seen that the figures of the law were adhered to in certain cases and not in others. In the case of one particular lens of the diffusing type, it was recommended by the testing laboratory that it should be used with bulbs of 7 candlepower, type B, and 6 candlepower, type C, this low candlepower being necessary in order to prevent dangerous glare, to the left of the car's path of travel. However, the Secretary of State ruled that bulbs of a maximum candlepower of 24 might be used with this type of lens.

In the case of another lamp, the testing laboratory stated that it failed to meet with specifications of the headlamp law with bulbs of more than 5 candlepower, but the Secretary of State advised that bulbs of 17 candlepower could

be used with it when the lamps were tilted. Under the law, the Secretary of State is empowered to submit devices that have been subjected to laboratory tests to an additional road test, and to be guided by the results of this road test in his ruling.

G. H. Stickney said the problem of headlight glare control was not an easy one and that any law on the subject must be absolutely equitable. He thought that with a little more experience they might be able to define the limiting glare permissible more closely than at present, and that later specifications would probably be more strict than the present ones. In his estimation, a laboratory test under specified conditions was infinitely better than any road test, and he had a feeling that the clause providing for road tests was put in with the object of making the law indefinite. A strict enforcement of the law might be a hardship on some manufacturers, but it was important that a fair interpretation should be placed on all requirements of the law.

A. W. Seaman, who said he represented the New York State Automobile Association, observed that in the State of Massachusetts there were more accidents due to want of sufficient light than to blinding glare. He made the point that the society, in working out the specifications for the tests, had tried to be too technical and had not looked sufficiently on the practical side of the problem.

#### Law Not Specific Enough

Dr. Sharp said that some of the requirements of the headlamp law were not sufficiently specific. While it said that the illumination should be sufficiently intense to enable a driver to see a man a distance of 200 ft. ahead of the car, on a dark road, it did not specify other conditions. He thought it would require headlamp bulbs of several hundred candlepower to give sufficient illumination to enable the driver to see a man in dark clothing standing on a dark, oiled road, at that distance from the vehicle, and equally intense illumination to discern a soldier in khaki against a background of discolored foliage.

The charge had been made that the committee in drafting the headlamp test specifications had fallen down. He wanted to know in what way the committee had fallen down. They had drawn up the specifications, and the Secretary of State had adopted them, but later he made decisions contrary to them. So far the specifications had not had a fair and adequate trial, and as things were shaping themselves now, they were not going to have such a trial.

#### Buyer From Bombay Arrives Here

NEW YORK, Nov. 18—P. C. Sawyer, of the firm of Hill, Sawyer & Co., Bombay, India, is now in the United States. He is interested in securing, on behalf of his firm, representation for all classes of automotive equipment and machinery. Mr. Sawyer should be addressed care of the J. B. Crockett Co., 44 Whitehall Street, New York.

**G. M. to Start in Janesville Soon**

JANESVILLE, Nov. 18—General Motors expects to resume work on its new tractor manufacturing plant, projected in connection with the power farm machinery business of the Janesville Machine Co., recently acquired, within a few days' time. The company began work on the first unit, consisting of a machine shop and assembly room, costing \$250,000, on Aug. 8, but work was stopped under government orders early in October. The end of the war has brought relief from the restrictions and arrangements to complete the plant are now being perfected. The main building is about 50 per cent finished. President W. C. Durant and other General Motors officials visited Janesville during the past week to look after affairs, and expressed themselves as hopeful of being able to go through with the project without further delay.

**J. E. F. Plug to Start**

MILWAUKEE, Nov. 18—The J. E. F. Spark Plug Co., Milwaukee, which established a plant at 1826 Brown Street about a year ago to manufacture a new type of spark plug, has incorporated its business without change of style and with an authorized capital stock of \$100,000. The company is planning to take new and larger manufacturing quarters and greatly increase its output. It probably will enlarge its line of products also.

**Stewart Core Building Damaged**

BELOIT, WIS., Nov. 18—The core building of the Stewart-Warner Speedometer Corp.'s large foundry plant in Beloit, Wis., was considerably damaged, one man was killed, and ten seriously injured when an explosion occurred as a core-drying over was being lighted on Nov. 6. The foundry is executing large Government contracts for hand grenades. Federal authorities are making an investigation.

**McCord Completes Large Addition**

DETROIT, Nov. 18—The recently completed addition to the main plant of the McCord Mfg. Co., Inc., contains 134,000 sq. ft., making a total area of 287,000 sq. ft. of floor space. This plant occupies 4 acres of ground, and plants Nos. 2, 3 and 4 add approximately 130,000 sq. ft. to the manufacturing space of the company in and around Detroit.

The new addition was erected in anticipation of the increasing requirements of the government for war work, and the major part of this building is now exclusively devoted to the production of heavy duty radiators for trucks, tractors, stationary generating sets, etc. The company employs 1200 people.

**Boston May Have a Show**

BOSTON, Nov. 16—Some Boston dealers are agitating in favor of a show. The talk has started among the dealers and it is growing stronger daily. Now the matter will be put up to the directors of The Boston Automobile Dealers Association.

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

tion. Some of the men feel that as the Boston show takes place in March there is plenty of time to get ready for it, particularly as Chester I. Campbell may be relieved of his war work. And as Boston has a truck show in connection with a passenger car show even if it were not possible to get a lot of show cars there would be enough of the latter here to make a fine showing with the trucks.

**Investigate Disposition of War Trucks**

BOSTON, Nov. 16—Congressman Alvan T. Fuller, distributor of Packard cars and trucks in Eastern New England, sailed to-day for Europe on a two months trip to investigate motor conditions abroad for the government. He will visit all the countries there and learn at first hand what disposition is being made of motor trucks and cars by the war departments of Europe, and the problem of disposing of the thousands of vehicles overseas owned by the Government.

**Dealers Anxious About Government Vehicles**

BOSTON, Nov. 16—Boston dealers are wondering just what the effect will be if the Federal Government decides to do the same thing with its motor cars and trucks that it proposes to do with its auxiliary patrol fleet. The Navy Department is going to have a clean up sale of boats shortly. If the same thing follows with trucks and cars there will be a big sale of them in New England. In Massachusetts there are hundreds of motor cars used by army and navy officers, by officials of the shipping board, and a dozen and one different committees making headquarters in Boston.

**Aircraft Contracts**

WASHINGTON, Nov. 16—The following orders were placed by the Aircraft Bureau on Oct. 30, 1918:

Dayton-Wright Airplane Co., Dayton, services.  
Prest-O-Lite Co., New York, tanks of acetylene gas.  
Graton & Knight Mfg. Co., Worcester, belts.  
Silvex Co., South Bethlehem, spark plugs.  
James Cunningham, Son & Co., Rochester, windlasses.

**Corporations Cannot Develop Business**

WASHINGTON, Nov. 18—Corporations that desire to float securities for development of their businesses will have to secure the approval of the Capital Issues Committee, Treasury Department, of this city before the stocks and bonds can be offered to the public. This ruling continues in effect despite the armistice, according to an official announcement today by the Capital Issues Committee.

**Stinson Tractor Nearly Ready**

SUPERIOR, WIS., Nov. 18—The Stinson Tractor Co., Minneapolis, expects to have its new plant in Superior, Wis., ready to begin production by Dec. 1. The factory, which originally was erected for the Continental Motor Truck Co., is now receiving machinery and equipment, brought to Superior from Stillwater, Minn., where the Stinson company purchased a complete machine shop equipment at a cost of more than \$80,000. For the present the production will be confined to a four-plow tractor, but later a two-plow machine will be put in process.

**Dearborn Buys Smith Truck**

CHICAGO, Nov. 18—The Dearborn Truck Co. has purchased the good will and all materials of the Smith Motor Truck Corp. and will remove the equipment to 2515-2525 West Thirty-fifth Street, where it has recently acquired a new factory building. The Dearborn company has added to its line a complete worm-driven truck in two models of 1½ and 2½ tons capacity and two models of chain-driven trucks in 1 and 2 tons capacity.

**Major Mitchell Lewis Injured**

MILWAUKEE, Nov. 18—Maj. Wm. Mitchell Lewis, 107th Field Signal Battalion, Thirty-second Division, American E. F., has been wounded in action in France, according to word received by his family at Racine, Wis. Maj. Lewis received a machine gun bullet wound in the back of his neck, but was out of the hospital within a few days afterward. He has been in the front lines in various sectors for more than five months. Maj. Lewis formerly was president and general manager of the Mitchell-Lewis Motor Co., now the Mitchell Motors Co., and later established the Lewis Motor Car Co., Racine. He entered the service in May, 1917. He served as captain of Co. F, 2d Wisconsin Infantry, during the Spanish-American war.

**Export Licenses Still Good**

WASHINGTON, Nov. 18—All export licenses which were issued by the War Trade Board on or after Nov. 15, 1918, or export licenses unexpired on that date will be valid until used, unless hereafter revoked, notwithstanding that such licenses are stamped as expiring on Nov. 15, 1918, or subsequently thereto. Collectors of Customs and Post Office Departments have been advised accordingly. The above ruling will not apply to licenses for exportation of any commodity to Norway, Sweden, Denmark, European Holland, Iceland, Switzerland or Greece.

Maj. Sherman M. McFedries, of Milwaukee, who has been at the head of the Milwaukee ordnance corps office for several months, has been transferred to the production department, district ordnance office, Chicago, under orders issued Nov. 5.

### Importance of Safety Movement

WASHINGTON, Nov. 19—The immense practical value of the safety first and safety appliance movement now growing rapidly in American industrial establishments is brought out in a bulletin by the Department of Labor, Bureau of Labor Statistics, entitled "The Safety Movement in the Iron and Steel Industry, 1907 to 1917."

It shows that, measured in terms of human life and limb, the efforts at accident prevention during the past ten years have reduced death and injury in that industry by no less than two thirds. In 1907, out of every 1000 men employed, 242 were killed or injured during the year; in 1917, the proportion had been reduced to 81 per 1000.

The reduction in the later years would no doubt have been more rapid had it not been for the advent of the world war with its enormous dislocation to all orderly processes. Its first effect upon American industry generally was one of great depression. Employment in the iron and steel industry declined rapidly, reaching its ebb about the middle of 1915. Then began an upward movement in activity and employment which was entirely with-

out precedent. The demand for labor led to the introduction of entirely new labor elements and to a movement of labor from place to place such as had never before occurred.

This placed an enormous strain upon accident prevention efforts. On the whole, it may be said that the test was well met. But in some branches of the industry there was a condition bordering on demoralization. Accident rates went up rapidly, but in very few of the better organized plants did the new rates rise as high as they had been at the next preceding period of industrial activity, and by the middle or latter part of 1916 the situation almost everywhere was well in hand.

The safety movement in the iron and steel industry may thus be said to have passed with credit its most serious test. But there must be no resting on the oars. Accident rates are still too high. If necessary, the safety movement must revise its foundation principles in order to meet the new demand. This report, indeed, directly broaches the question, "Can serious industrial accidents be eliminated?" and seeks to prove that such a goal is possible of attainment.

Nos. 17 and 18 over 36 in. to 44 in., 10c. per 100 lb.		
Nos. 19 and 21 over 36 in. to 44 in., 30c. per 100 lb.		
Nos. 22 to 24 over 26 in. to 40 in., 40c. per 100 lb.		
Nos. 22 to 24 over 40 in. to 44 in., 80c. per 100 lb.		
<b>Black Sheet Extras to Apply to Narrow Widths:</b>		
Oiling, 10c. per 100 lb.		
Patent leveling, 25c. per 100 lb.		
Resquaring, 5 per cent of gage price after quality, finish and size extras have been added.		
Seconds 10 per cent less than the invoice Pittsburgh price for corresponding primes.		

The argument is briefly this: The statement that accidents cannot be entirely prevented rests primarily upon the conviction that accident occurrence is due in the main to the human factor, to the "carelessness" of individuals. Since a perfect humanity is not yet in sight it is urged that results which demand perfection cannot be expected. A careful analysis of a large group of fatal and serious accidents indicates, however, that such accidents are due primarily to fundamental engineering or structural defects in which the workman has no part. Numerous illustrations are cited.

A man in violation of orders walks under a swinging crane which breaks and he is killed. His "carelessness" is blamed, but the real cause was a faulty chain. An oiler is caught on a smooth shaft by some loose portion of his clothing. He is blamed because he had been forbidden to wear such clothing.

But it is possible to equip all shafts with bearings which render approach while the machinery is in motion wholly unnecessary. In general it is argued that structures so strong, so well designed, the material so well selected that they cannot fail are possible.

## Walter S. Gifford Resigns

WASHINGTON, Nov. 19—Brig.-Gen. Walter S. Gifford, Director of the Council of National Defense, has resigned to return to the American Telephone and Telegraph Co. as comptroller of that organization, his services having been loaned the Government throughout the war period.

E. V. Rippingille, assistant sales manager of the Hudson Motor Car Co., Detroit, whose time since the entrance of United States in the war has been spent in Washington, where he has been engaged in special work for the Government, has returned to his duties in Detroit.

R. R. Cook, one of the field organizers of the Lalley Electro Lighting Corp., has been appointed assistant sales manager. Previous to his connection with the Lalley corporation he was foreign sales manager of the Cadillac Motor Car Co.

O. C. Bornholt, formerly factory manager of the Holley Kerosene Carbureter Co., Detroit, has been appointed mechanical engineer of the Buick Motor Co., Flint.

C. W. Stephens has been appointed manager of sales for the Detroit Twist Drill Co., Detroit, succeeding Nelson J. Smith, who is now assistant to President Muir B. Snow.

A. E. Walden, for the last seven years experimental engineer of the Chalmers Motor Co., Detroit, has resigned to take charge of the Government experimental station at Indianapolis, under Captain D. M. Lasley.

W. J. MacInnes, formerly advertising manager of the old Rapid Motor Vehicle Co., Pontiac, Mich., has become associated with the Division of Films, Committee on Public Information.

H. D. Runciman has been appointed general manager of the Hoover Steel Ball Co., Ann Arbor, Mich. He was formerly assistant to the general manager.

## Fulton Declares 11 1/3 Per Cent Dividend

FARMINGDALE, L. I., Nov. 20—The Fulton Motor Truck Co. has declared accumulated dividends from Feb. 1, 1917, to July 1, 1918, amounting for the period to 11 1/3 per cent. These are payable Jan. 10.

## Standard Truck Enlarging Plant

DETROIT, Nov. 19—The Standard Motor Truck Co. is erecting an addition, 65 x 175, to plant No. 1. Construction of a second unit of the same size will be started as soon as the building is completed. These structures have been necessitated by rapidly increasing business.

## Men of the Industry

*Changes in Personnel and  
Position*

## New Zealand Dealer Coming

NEW YORK, Nov. 20—J. B. Clarkson of the Hope, Gibbons Sons and J. B. Clarkson, Limited, Wellington, N. Z., wholesale dealers in cars, motorcycles and accessories, has sailed from New Zealand and is expected in the United States some time during the month of November.

## Jobbers' Trial Jan. 6

NEW YORK, Nov. 21—Jan. 6 has been set as the date for the trial of the Government case against the National Association of Automobile Accessory Jobbers in the United States Court in this city. It is estimated that the trial will last until about the middle of February.

## Want Army Trucks for Mail

NEW YORK, Nov. 20—A plea for the employment of a large number of motor vehicles and personnel of the army in the parcel post motor truck routes was made here to-night by Fourth Assistant Postmaster General James I. Blakslee in an address presented before the Transportation Conference held under the direction of the Colt-Stratton Co.

Postmaster Blakslee pointed out that many thousands of the motor truck drivers who have seen service abroad and who soon will be returned to this country will naturally want to remain in the class of work which they can best perform and that their employment on new parcel post routes will provide many thousands of such men with immediate employment.

The Postmaster also asked for a large number of the War Department's motor trucks that are now in this country and may be returned from abroad. The War Department has given Postmaster Blakslee a 3-ton Packard semi-Class B truck, one of the Mack 5 1/2-tonners used by the Engineering Corps and one of the standardized Class B war trucks. Postmaster Blakslee will put these vehicles on routes during the coming week to ascertain whether they are suitable for the work in hand before he makes application to have any others of the same class turned over to him.

## To Map Air Lanes

WASHINGTON, Nov. 20—The future possibilities of civilian airplane use are suggested by an announcement to-day of the War Department that beginning Friday fliers will chart air planes throughout the United States. This will form the basis of complete air maps linking every important city and community in the country.

## Browne on Reconstruction Committee

MILWAUKEE, Nov. 18—George W. Browne, one of the leading motor car distributors and dealers of the United States, and distributor of the Overland and Willys-Knight in Wisconsin, has been selected as one of fifty manufacturers, merchants, business and professional men of Milwaukee to serve as a member of the "reconstruction council," a body created by the Milwaukee Association of Commerce to formulate and supervise methods of facilitating the reversion of industry from a war to a peace basis without undue disturbance of the economic equilibrium.

## Dearborn Tractor Plant on 100 Per Cent Schedule

DETROIT, Nov. 20—The tractor plant of Henry Ford & Son at Dearborn is now operating on a 100 per cent peace-time production schedule. The company has on its books orders for 20,000 tractors. To maintain production, the company will employ an additional 500 men between now and January. Charles E. Sorensen, General Manager, said: "Mr. Ford believes it is up to the workmen of the United States to support the manufacturers to the limit in order that materials may be produced for war ravaged Europe and progressive America. With this in mind our 3000 employees are working at a pace that should set a new record in industrial lines."

The special plant erected by the Government as a tank factory is being utilized to take care of increased tractor production.

## Weather Causes Shut Down of Plant

Weather conditions making it impossible to launch boats in the river Rouge during the winter months has caused the Ford Motor Co. to stop work at the Detroit Eagle plant. The remainder of the 100 Eagles ordered by the Navy Department will be completed at the New Jersey plant. Officers and enlisted men of the United States and Italian navies on duty at the Detroit Eagle plant will be ordered transferred in a short time at the main plant of the Ford company. Changes in the working shifts are being made. Most of the men who have been working from midnight till 8 a. m. are being transferred to other shifts, indicating that the Ford company is to operate only two crews for the time being. Apparently aircraft production has been cancelled.

## Pre-Armistice Contracts

WASHINGTON, Nov. 19—The following contracts were let by the Government prior to the armistice and just announced:

American Optical Co., Southbridge, Mass.; goggles, \$9,332.  
W. J. V. Motor Car Co., Newark; trucks, \$11,900.  
United States Tire Co., New York; tires, \$14,018.75.  
General Motors Corp., Flint; motors parts, \$16,125.  
Flske Tire & Rubber Co., Chicopee Falls, tires, \$15,973.60.  
Continental Auto Parts Co., Knightstown, Ind.; motor parts, \$9,732.50.

## Contracts Placed

WASHINGTON, Nov. 18—The following contracts, including purchases of AA chassis, B chassis, T passenger cars and huge quantities of supplies and tires, were passed by the Quartermaster Board of Review:

Ashtabula Nut & Bolt Co., Ashtabula, skid chains, \$6,380.  
Velle Motors Corp., Moline, motor parts, \$7,364.07.  
Fisk Rubber Co., Chicopee Falls, tires, \$11,726.  
Packard Motor Car Co., Detroit, Packard chassis, \$1,837,920.  
The Trailmobile Co., Cincinnati, pigeon-loft trailers, \$42,600.  
Peerless Motor Car Co., Cleveland, extra equipment, \$426,000.  
International Harvester Co., Chicago, bodies and troop seats, \$157,000.  
Continental Motors Corp., Detroit, trucks, \$505,000.  
Ford Motor Co., Detroit, Ford cars, \$483,760.  
Kelly-Springfield Motor Truck Co., Springfield, chassis "B," \$3,038,000.  
Kelly-Springfield Motor Truck Co., Springfield, trucks, \$769,250.  
Bosch Magneto Co., New York, magnetos, \$94,000.  
Winton Engine Works, Cleveland, generator sets, \$587,600.  
United States Tire Co., New York, tubes and casings, \$26,790.44.  
Packard Motor Car Co., Detroit, chassis (special equipment), \$738,540.  
Prudden Wheel Co., Lansing, wood wheels, \$80,000.  
Hayes Motor Truck Co., St. Johns, Mich., wood wheels, \$30,000.  
Ford Motor Co., Detroit, chassis "T," \$1,361,208.  
Westfield Mfg. Co., Westfield, Mass., bicycles, \$179,550.  
Republic Tire & Rubber Co., Youngstown, tires, \$39,712.  
U. S. Tire Co., New York, tires, \$124,560.  
Ford Motor Co., Detroit, ambulances, \$571,734.  
Pierce-Arrow Motor Car Co., Buffalo, chassis, \$3,690,390.  
Firestone Tire & Rubber Co., Akron, tires, \$11,816.20.  
McQuay-Norris Mfg. Co., St. Louis, piston rings, \$8,788.15.  
B. F. Goodrich Co., Akron, tires, \$12,177.  
Standard Motor Truck Co., Detroit, motor parts, \$22,068.31.  
Garford Motor Truck Co., Lima, trucks, \$2,706,704.  
Fisk Rubber Co., Chicopee Falls, tires, \$351,044.  
B. F. Goodrich Rubber Co., Akron, tires, \$431,360.  
Liberty Motor Car Co., Detroit, trucks, \$267,500.  
Cadillac Motor Car Co., Detroit, spare parts, \$95,039.62.  
Great Western Mfg. Co., Laporte, bicycles (contin.), \$79,775.  
Atlantic Refining Co., Philadelphia, gasoline, \$352,500.  
Davis Sewing Machine Co., Dayton, bicycles, \$84,925.  
Great Western Mfg. Co., Laporte, bicycles, \$79,875.  
Hercules Buggy Co., Evansville, bodies, \$286,000.  
Davis Sewing Machine Co., Dayton, bicycles, \$89,775.  
Goodover Tire & Rubber Co., Akron, tires, \$470,891.20.  
Goodover Tire & Rubber Co., Akron, casings and tubes, \$51,231.60.  
Firestone Tire & Rubber Co., Akron, tires, \$424,240.  
Kuhlman Car Co., Cleveland, bodies, \$143,000.  
Grand Rapids School Equipment Co., Grand Rapids, bodies, \$214,500.  
Glascock Bros. Mfg. Co., Muncie, Ind., bodies, \$214,500.

## Q. M. Orders Ford Cars Worth \$5 118,400

WASHINGTON, D. C., Nov. 16—Just prior to the signing of the armistice the Quartermaster Department placed orders with the Ford Motor Co. for Ford cars amounting to \$5,118,400.

## Quartermaster Contracts

WASHINGTON, Nov. 16—The following orders were placed by the Board of Review, Quartermaster Department, on Oct. 25:

## Contracts

Philadelphia, Atlantic Refining Co., Philadelphia, gasoline, \$5,000.  
Philadelphia, Atlantic Refining Co., Philadelphia, grease, \$3,340.  
The Ohio Canvas Goods Mfg. Co., Toledo, truck covers, \$11,475.  
H. C. Griffin & Co., New York, boxing trucks, \$12,500.  
Willis-Overland Co., Toledo, canvas covers, \$64,240.  
Ford Motor Co., Detroit, Ford cars, \$3,946,180.  
Ford Motor Co., Detroit, Ford cars, \$1,172,220.

## Machinery and Engineering Contracts

WASHINGTON, Nov. 15—The following contracts were placed by the Machinery and Engineering Materials Division, War Department:

Goodyear Tire & Rubber Co., Washington, hose suction.  
Dyneto Motor Corp., Syracuse, new way air-cooled engines (gas, electric), and parts.  
Penberthy Injector Co., Detroit, brass globe and check valves.  
Detroit Lubricator Co., Detroit, Mich., fusible plugs.  
S. F. Bowser & Co. (Inc.), Fort Wayne, pumps.  
International Harvester Co., Chicago, gasoline and kerosene engines.  
Hercules Gas Engine Co., Evansville, gasoline and kerosene engines.  
Novo Engine Co., Washington, repairs for Novo engines.  
The Cook Motor Co., Delaware, Ohio, gasoline engines.  
Bureau of Aircraft Production, Washington, spar varnish.  
General Asbestos & Rubber Co., Charleston, folded asbestos gaskets.  
Bethlehem Steel Co., Washington, switch stands.

## Calendar

Feb. 25-28—New York—American Road Builders' Assn., Sixteenth Annual Convention.

## SHOW

- Jan. 13-14—Des Moines, Ia.—First Tractor Show Des Moines Tractor & Tractor Club. H. J. Clark, Mgr.

## Signal Officer Contracts

WASHINGTON, Nov. 15—The following contracts were placed by the Chief Signal Officer:

Eaton Storage Battery, Orange, storage batteries.  
Willard Storage Battery, Evans Building, Washington, syringe hydrometers.  
Electric Storage Battery Co., Washington, 2000 storage batteries.  
Willard Storage Battery Co., Washington, hydrometer syringes.  
B. F. Goodrich Rubber, Akron, 7500 miles twisted pair wire.  
White Co., Cleveland, 1 kit tools for radio tractor.  
H. W. Johns-Manville Co., New York, 600 lb. Chatterton's compound.  
Willard Storage Battery Co., storage batteries.  
American Propeller & Mfg. Co., Baltimore, regulating air fans.  
Gould Storage Battery Co., storage batteries.  
Willard Storage Battery Co., storage batteries.  
U. S. Light and Head Corp., storage batteries.

## Modern Steel Rebuilding Plant

MILWAUKEE, Nov. 16—The Modern Steel Treating Co., Milwaukee, is rebuilding its plant at 619 Thirty-eighth Avenue, destroyed by fire Oct. 17, with a loss of \$25,000.

## Extracts from the Diary of Von Richthofen

(Continued from page 881)

seems not impossible that the day may come when a whole division will be transported in such a thing. In its body one can go for a walk. It contains an apparatus for wireless telegraphy by means of which one can converse with the people down below. In another corner are hanging the most attractive "liver sausages" which one can imagine. They are the famous bombs which cause such a fright to the good people down below. At every corner is a gun. The whole thing is a flying fortress, and the planes with their stays and supports look like arcades. I have never been able to find enthusiasm for these giant barges. I find them horrible, unsportsmanlike, boring and clumsy. I rather like a machine of the type of "le petit rouge." If one is in a small chaser machine it is quite immaterial whether one flies on one's back, whether one flies up or down or stands on one's head. One can play any tricks one likes, for in such a machine one can fly like a bird. The only difference is that one does not fly with wings, as does the bird albatross. The thing is, after all, merely a flying engine. I think things will come to this, that we shall be able to buy a flying suit for 60 cents. One gets into it. On the one end there is a little engine and a little airscrew. One sticks one's arms into the planes and one's legs into the tail. Then one does a few leaps in order to start, and one goes up into the air like a bird.

My dear reader, I hear you laughing at my story. But we do not know yet whether our children will laugh at it. Everyone would have laughed fifty years ago if somebody had spoken about flying above Berlin. I remember the sensation which was caused when in 1910 Zeppelin came for the first time to Berlin. Now no Berlin gutter-brat looks up into the air when an airship is coming along.

## Never Has the Future Held Greater Promise Than Today

Today the world stands on the threshold of the greatest era of progress and prosperity ever experienced.

The triumph of freedom has killed for all time to come the doctrine that might makes right.

Through the sacrifice of millions who laid down their lives on battlefields, the humblest person, the smallest nation may now enjoy life, liberty and the

pursuit of happiness, free forever from the dread of a mighty but unscrupulous neighbor.

Let us all, therefore, turn our hearts and hands to our appointed tasks with renewed and joyous energy—not forgetting that now as during the dark days of war our first duty is to our Country and humanity.

Let every one of us play his full part in the great task of reconstruction that lies before us.

**Hudson Motor Car Company**

Detroit, Michigan

UTILITY PUMPS  
for All Cars \$12.00.  
For Fords \$7.50

UTILITY HEATERS  
for All Cars \$9.00 to \$25.00

UTILITY RIM  
WRENCH  
for All Cars \$1.75

## What Heater?

Car heaters are here to stay. No one will deny that. They are fast modernizing every car. The only question is what heater to sell—what heater to install.

Dealers and car users who know most about heaters favor the UTILITY. There are many reasons.

UTILITY Heaters cost nothing to operate—have no upkeep expense—heat, but cannot burn—can be regulated to any degree of temperature—collect no dirt—are installed without ruining the floor board—furnish a neat ornamental foot-rail—cost little for great comfort.

There is a UTILITY Heater for every car, ranging in price from \$9.00 to \$25.00. Handled by good dealers everywhere. Send for booklet.

Dealers: Order of your jobber.

## Probable Effects of War Motor Apparatus on Commercial Design

Solution of Many Problems Connected with the Development of  
Creeper Type Machines Should Be Useful—War  
Experiences Likely to Benefit Engineering

**W**ITH the war drawn to a close, it will be only a short time before a large number of officers who have served during the period of hostilities, in the non-combatant branches, will be released. In the Ordnance and Quartermaster departments there have been a large number of men recruited from the automobile and allied industries. These men are going to bring back into the industry the fruits of an experience which should be of material value in commercial life.

One of the results of our short period of war will be to reintroduce into the automotive industries a number of men who have gained an intensely valuable experience and, furthermore, it is going to be possible to adapt for commercial uses some of the highly valuable apparatus developed for war purposes. There has been a wide variety of new material designed for extremely rigorous usage, and since this material was planned without regard to experimental cost it is in the main the acme of useful design.

### Lessons from the Ordnance Department

It is not necessary to search further than the Motor Equipment Section of the Engineering Division, Army Ordnance, for a record of engineering accomplishment from an automotive standpoint. In fact, the work done during the past year in this section has never been duplicated in commercial life. With appropriations amounting to hundreds of millions, and the resources of the country both in

raw materials and manufacturing facilities at its disposal, this department has gone ahead on a program which has already placed this country at the head of the list in certain forms of motor equipment.

The work covered by this section has been of wide scope. It has embraced everything from heavy fighting tanks to motorcycles. It has included every sort of drive, including all forms of track-laying types as well as solid and pneumatic tired wheel variety. Out of this wealth of apparatus it is certain that we can derive some valuable lessons for commercial usage. Driven by military necessity, the Motor Equipment Section has designed special types of bodies adaptable to a wide line of truck chassis which show a marked ingenuity and utility and which immediately suggest the possibility of well-planned special body designs for industrial and merchandising requirements.

### Some Examples of Special Design

It may be interesting to cite a few typical instances of special design which are not surrounded by a veil of secrecy. Probably of greatest use from a military standpoint, and perhaps adaptable to a field not fully realized in agricultural and other peaceful pursuits, are the heavy type of track-laying tractors.

The heaviest of these brought out by the Ordnance Department is the 20-ton artillery tractor, which is a specially adapted 120-hp. Holt design. It is 252 in. in length and weighs 27,000 lb. with gasoline, oil

and water. Yet its ground pressure is only 7.17 lb. per square inch.

This tractor is particularly designed for hauling heavy guns and other weighty military material over all sorts of road and ground conditions. Its low unit pressure and high drawbar horsepower enable it to bring the heaviest pieces of artillery into action regardless of highly difficult conditions of terrain.

The 10-ton artillery tractor is a similar design with many of the same characteristics, though, of course, due to its lighter weight it has a higher speed capacity. The 20-ton pulls its load at 3.27 m.p.h. at 600 r.p.m., while the 10-ton pulls its load at 4.19 m.p.h. at 600 r.p.m., or at 5.59 m.p.h. at 800 r.p.m. There are also 5-ton and 2½-ton artillery tractors which travel at correspondingly higher speeds.

At first it would not seem probable that equipment of this kind would be readily adaptable to agricultural, commercial or merchandising purposes, yet there are many sections of the country where devices of this kind would be highly useful in logging, hauling and farming operations.

### Heavy Haulage Problems Attacked

There are many sections of the country undeveloped because of the difficulty of hauling heavy loads over the soft and marshy ground. It has always been true in this country that after a war considerable employment has been found for returned soldiers in the development of tracts of previously unimproved territory. The apparatus which has proven so valuable in war work over ground torn by shell fire cannot help but be of assistance in work of this nature.

The utilization of knowledge gained in special truck designs is certain to be a stimulation in the truck field. The success of the war designs, in which the co-operative efforts of various engineers in the truck industry were utilized to produce the best possible truck regardless of expense, has taught lessons which have already begun to make themselves felt.

While quite certain that the question of economy was the last considered in the war designs, and endurance and performance given the first consideration, it will not be necessary to discard all that has been learned in these designs to produce successful commercial vehicles.

### Work of Civilian Employees

The work of the Motor Equipment Section in regard to its line of trucks and truck bodies has been one of the bright spots in this country's rapid preparation for war. It is needless to say that the majority of the accomplishments in this field were made by men drawn from the automotive industries. In Washington in military and civilian capacities are men who are working at one-tenth their previous incomes in many cases. These men have gone wholeheartedly about supplying a line of motor equipment which has increased the mobility of our army equipment to a vast extent.

These trucks are of all sizes, some of them, such

as the F. W. D., Nash, White, Commerce and Dodge, have been taken almost entirely from commercial production, and with only slight engineering modifications have been made to fulfill a wide line of purposes. On these chassis have been mounted bodies adapted for carrying supplies, men and traveling repairshops which have been invaluable in maintaining the artillery and equipment of the armies in the field.

A great many of the ordnance vehicles have been mounted on the Nash 2-ton and the F. W. D. 3-ton truck chassis, and certain bodies have been mounted on both these chassis. From truck chassis like the 1-ton White, high-speed truck service has been required.

### Forecast of Vehicles to Come

For example, on this chassis has been mounted a staff observation car having a rated load capacity of 1 ton. This is a pneumatic tired job capable of carrying nine passengers. The front and rear seats comfortably seat three persons each and the folding auxiliary seats accommodate three more. The chassis is of White manufacture, conventional in design and has a rated capacity of 1 ton. The tires are 36 x 6 in. and the car is driven by a four-cylinder block cast White engine.

The car carries a complete set of mechanic's hand tools and body equipment tools, the latter consisting of shovels, pick, lantern and so forth. The body is also fitted with numerous chests for special equipment. It is provided with a four-speed gearbox and throughout is designed for severe overland service.

Probably the lightest truck chassis utilized by the Motor Equipment Section has been the Dodge. The light repair truck body mounted on this is typical of the sort of load which this chassis is relied upon to carry. It has a rated load capacity of 1000 lb.; the maximum gross weight loaded is 3600 lb. The body on this is an Ordnance Department design, while the chassis is very little different from the passenger car chassis made by Dodge Brothers. The body is made up entirely of steel and is divided into a front compartment which has a single seat and a rear compartment which is used for trucking purposes, closed by a tail-gate or door.

The front seat can carry three. The rear part of the body has the following inside measurements: length from back of seat to the tail-gate or door, 62½ in.; inside width, 46 in.; height, 48 in. The body carries a complete repair equipment of machine and carpenter tools, a mechanic's vise which can be attached to the tail-gate and a 2-ton block and tackle. In addition there are chests in which repair parts and emergency lubricants are carried.

### Adapting Commercial Designs

As an example of a body used on two chassis there is the machine gun car which is mounted on the 1-ton Commerce chassis and also the White chassis. This machine gun car is a standard design so arranged as to carry nine passengers, a machine gun, and various equipment such as spades.

(Continued on page 945)

# Resistance of Hot Spark Plug Insulators

Tests Conducted to Determine the Loss of Resistance of Insulators at Spark Plug Working Temperatures—How Such Loss Affects the Action of the Plug

By Dr. R. H. Cunningham

Consulting Ignition Engineer

**W**ITHIN the past 2 years considerable attention has been directed to the electrical behavior of certain insulating materials for spark plugs, and since the advent of the high-compression airplane engine with its plug-disturbing tendencies, both spark plug and engine manufacturers have had special reasons to urge the makers of such insulation to produce materials more suitable, both mechanically and electrically, to the requirements of internal combustion engines.

Although there is plenty of room for scientific criticism of the shapes, dimensions and design of some of the commercial spark plugs, both from a mechanical and an electrical standpoint, my aim in this article is only to discuss broadly the electrical behavior of some of the materials most commonly employed as insulators in spark plugs.

## Heat Impairs Insulating Qualities

It has long been recognized that when insulators such as porcelain, mica, quartz, etc., are heated up they become conductive to a certain extent, so that if these substances are used for spark plug insulation, forming the dielectric of a condenser, more or less leakage of charge takes place and gives rise to misfiring.

This leakage of electric charge is made up of two components, namely, leakage over the surface of the insulator and leakage through its substance.

Although it is quite possible to separate these two leakages numerically when the insulating material is of a certain form, it is rather difficult to do so in the case of the usual spark plug, owing to the shape of the insulator and to the disposition of its various metallic parts. In certain types of porcelain plugs, however, a fair idea of the surface leakage, as differentiated from the substance leakage, can be obtained by the means described below.

## Surface Leakage Must Be Considered

In giving data relating to the resistance of insulators of this kind, the customary method has been to state the resistance in ohms or meg-ohms between opposite faces of a cube of one centimeter length of side, and usually an alternating electric motive force of from 60 to 100 cycles and of approximate sine wave form is applied to the insulation under test. Although the meg-ohms of a centimeter cube are well enough to know from a scientific standpoint,

such knowledge conveys very little definite information to the makers of spark plug insulation and to spark plug manufacturers. Besides, the results obtained by the application of the alternating sine wave current to the insulation give but a very hazy idea of what occurs when the insulation is assembled in the plug and a portion of the latter is subjected within the hot compression chamber to the "steep front," high voltage electric surges that are delivered by efficient types of ignition apparatus.

It occurred to the writer, therefore, over a year ago, that it would be both interesting and instructive to study the leakage behavior of several commercial varieties of spark plugs, both in the cold state and when heated to temperatures of 100° C. or higher, applying, however, potential differences to the plug electrodes more closely equalling those applied in actual service. It seemed quite reasonable to infer that with the information such an investigation would furnish, one should be able to predict the electrical behavior of plugs in an engine from preliminary measurements of a few sample plugs of similar design and of the same material. Thus, if much leakage of current occurs in the hot plug, one logically infers that there will be at least a serious diminution in the intensity of the high-tension ignition spark, especially when the generator of the spark is capable of but feeble output. Nevertheless, it is conceivable that even if certain kinds of hot spark plugs do leak to some extent, the effects of such leakage upon the maximum voltage usually created at the points of the plug by the high tension ignition magneto or induction coil may be partly compensated by both the increased ionization that occurs on heating the plug, and the increased conductivity of the heated, smoky, gaseous dielectric filling the space between the points just prior to the ignition of the compressed gas.

## Maximum Temperature of Plug

During the consideration of the various methods whereby a solution of the above problem might be obtained, the first question that puzzled the writer was, "How hot does a spark plug become in a working combustion engine?" That part of the plug exposed to the surrounding air, and that part of the metal shell screwed into the usually water-jacketed cylinder, never become heated to the same extent as the portions of the plug within the cylinder. Now, although the plug points, and probably the tip end of the central stem of insulation undoubtedly do very often become red hot, at least

Fig. 1—Diagram of spark circuit

Fig. 2—Diagram of apparatus used in leakage tests

Fig. 3—Control curve of apparatus

for a brief period during the explosion stroke, very probably in a properly cooled engine the redness has disappeared from these parts early in the suction stroke, so that at the time of firing the compressed gas, the plug points and adjacent insulation, although quite hot, are no longer incandescent. Were this not the case, preignition from clean hot plugs would be quite the rule rather than the exception.

#### High Temperature Assumed

Since no definite information regarding the temperature reached by the plug in the average engine was obtainable, it was considered better to investigate the degree of leakage that is present in the plug when heated to a temperature somewhat higher than that reached by it in a working engine. If the plug still retained its sparking function under such conditions, the logical conclusion would be that, since the leakage increases with increase of temperature of the insulator, the plug would perform its function still better at lower temperatures. Although a number of plugs were investigated at temperatures varying from 23° C. to 360° C. the most striking results were obtained from those heated to a dull red heat usually, and in some instances to a cherry red (500° C. to 800° C.). Spark plugs are subjected to voltages of several thousand volts when performing their function within the engine cylinder, and the testing voltages applied to the plugs in my tests were of the same magnitude.

#### Compression Adds to Break-Down Voltage

It is a matter of common knowledge that with the spark points of the plug set at a given distance, 0.025 in., for example, the break down voltage of the gap in air at atmospheric pressure is considerably less than that in air at a compression of 75-125 lb. Owing to the fact that the critical break-down voltage of the gap varies in accordance with the distribution of the electrostatic field between the plug points, and with the shapes and the areas of the surfaces of the points, it is impossible to assign a definite break-down gap voltage to spark plugs of different styles that would be applicable to all the different commercial types of plugs. In the limited number of plugs tested by me, usually the critical break-down voltage of cold plugs with a 0.031 in. gap. ranged between 3400 and 3600, depending upon whether the spark tips were blunt, sharp, edged, round balls, etc., and also upon the number of individual prongs. In order to subject the plugs to the higher voltages required to break down the gap under compression, the prongs were bent widely open and a thin mica tube of suitable diameter and length was inserted into the open cavity of the plug between the outer shell and the central stem of insulation around the central metal electrode. Thus protected the individual plugs examined by me, all readily withstood, at room temperature, an e.m.f. of 12,000 volts steadily applied between the central electrode and the grounded shell.

Since the ordinary bridge and galvanometric methods of measuring resistance are not suitable where testing voltages of 6000 V. are employed, the method used and described by the writer was chosen, which commends itself for its simplicity and convenience, as well as for the fact that the accu-

Fig. 4—Leakage curve of cold porcelain plug

acy of the results obtained are amply sufficient. Further by this method one can obtain a permanent photographic record that is practically free from errors due to defective observation by the investigator.

The method is based on the fact, demonstrated many years ago by Lord Kelvin, that if the resistance  $R$ , the inductance  $L$ , and the capacity  $C$  of an electric circuit, such as shown in Fig. 1 have such a relationship that  $R^2C > 4L$ , then the high tension charge of the condenser  $C$  will die away gradually, in such a manner that the discharge current is always in one direction. Since in our case the inductance consists of a few short pieces of stranded wire, the value of  $L$  is extremely small and may be neglected. Now if  $C$ , whose capacity in microfarads is accurately known, is charged to an accurately measured voltage and discharged through a very high resistance, such as the porcelain or the mica insulation in a spark plug, and if the time required for the voltage of the charge to fall to  $1/e$  of its original value,\* is accurately measured, then it can be readily proved mathematically that the time constant  $T$  of the condenser circuit equals  $RC$ . So that if we express  $T$  in seconds,  $R$  in meg-ohms and  $C$  in microfarads we have,

$$R_{mcg} C_{mf} = T.$$

Or if the time required for the voltage to fall to  $1/e$  of its original value is very long, owing to the very large value of  $R$ , a sufficiently accurate value of  $R$  can be determined by means of the well known formula,

$$R_m = \frac{T}{C_{mf} 2.303 \log \frac{V_1}{V_2}}$$

in which  $V_1$  is the voltage to which the total capacity is charged;  $V_2$ , the voltage of the charge after the expiration of  $T$  seconds.

#### Measuring Instrument Described

Since the resistance of the plug insulation may lessen considerably when the plug is heated, thus permitting the charge of  $C$  to disappear within a small fraction of a second, means are necessary whereby both the changing voltage and the time can be simultaneously measured. To accomplish this, one of the elements of a part of the total capacity  $C$  is permitted to move from a position of wide deflection toward the zero through a microscopic distance as the charge in the condenser either slowly or rapidly dissipates itself through and over the surface of the insulation of the plug. By using a microscope to highly magnify the slight movement of the movable element of the condenser and projecting the shadow of the moving element, in our case a gilded quartz fiber—upon the horizontal slit of a drum camera behind which is placed a moving sensitive photographic film, the moving shadow inscribes upon the rotating film the exact curve of the dead beat discharge of the capacity  $C$ . To mark small fractions of time

\* $e = 2.71828$ , the base of Napierian logarithms.

during the discharge, the beam of light through the microscope is momentarily intercepted at definite intervals by the spokes of a wheel rotated at a uniform speed. The deflections of the above variety of condenser, which belongs to the electrometer type of instrument and is known as a string electrometer, can be adjusted to be either proportional to the square of the difference of the potentials of its plates and string (ideostatic connection), or the instrument can be made to give deflections which are directly proportional to the difference of the potentials of its plates, by using the Heterostatic connection and employing an auxiliary electric charge to the string from a battery of small dry cells sufficient in number to generate an e.m.f. of several hundred volts. As a matter of greater convenience in working, and owing to the fact that our high tension dry cell battery happened to be out of commission during the earlier part of the investigation, the deflection scale of the various curves reproduced in this paper is of the former type. The calibration, for example, is such that if an e.m.f. of 3000 volts is applied to the capacity  $C$  of which the electrometer forms a part, a deflection of 1 cm. from the abscissa is produced; with 6000 volts a deflection of 4 cm. occurs. The value of any millimeter line of the scale can thus be readily computed from the following equation:

$$\frac{V_1}{V_2} = \frac{\sqrt{D_1}}{\sqrt{D_2}}$$

in which  $D$  is the deflection in centimeters and  $V$  the volts. To calibrate the instrument an accurate Kelvin electrostatic voltmeter, indicating to 12,000 volts, was used. To charge the total capacity, consisting of electrostatic voltmeter, condenser, connecting cables and high tension switches, any high tension source of steady direct current may be used. A Wimshurst static machine was found extremely handy for this purpose by the writer. Fig. 2 is a diagram of the connections used during the tests.

#### Control Curve of Apparatus

As with all leakage methods in which high tension electricity is used, a so-called control curve of the apparatus should be made before any attempt is made to obtain actual data of the resistances and leakages of the plugs or of insulation of other nature. Fig. 3 shows the beginning and the end of such a curve occupying a time of two hours. During this time the deflected shadow of the string moved two millimeters and hence the drop in voltage during this time was only 153 volts. With such a small change occurring in such a great length of time, errors from instrumental leakage occurring during the brief period of time required for the capacity  $C$  to discharge through the resistance of the heated insulation of the plug would be negligible. In very humid weather, however, the surface leakage over the insulation of the apparatus may be considerable, hence the tests are performed preferably on days when the humidity of the air is low.

In Fig. 4 a cold (27.5 deg. C.) porcelain-insulated open-end plug with spark points widely separated is made a part of the capacity, and switch  $S_1$  (Fig. 2) is closed. During a time of 13 min. the voltage dropped from 6000 volts to 5770. The resistance  $R$  is thus 133561.6 meg-ohms. By heating this plug to a dark red heat and letting it cool slightly until entirely dark, the discharge curve reproduced in Fig. 5 was obtained. The resistance in this instance dropped to 18.94 meg-ohms. Curve Fig. 6 is from the same plug when at a dull red heat and its resistance has become still less, viz., 3.157 meg. In Fig. 7, the curve is from a well known European plug in which the insulator is supposed to be of steatite. Its cold resistance is 109090.9 meg. and when heated dark red, its measured resistance dropped to 13.68 meg.

Since the leakage rates of the various plugs whose curves are reproduced in this paper approximate that shown in Fig. 4, when tested in the cold state, their reproduction is omitted in order to conserve space, and discharge curves from the heated plugs only are given.

#### Curve of Red Hot Mica Plug

Fig. 8 is a reproduction of a curve obtained from a red hot new mica plug, which, even at a heat, probably never reached in a working combustion engine, still possesses a resistance of

333.684 meg. At room temperature the same plug showed a resistance of 202105 meg. prior to the first heating.

Now it must not be inferred that all porcelain and mica plugs when heated, behave exactly like the few samples whose test results are recorded in this article. Quite the contrary, for early in the investigation it became evident that the amounts of leakage occurring in the different plugs when heated to the same temperature varied considerably, even in plugs composed of apparently the same kind of material and with a fairly similar distribution of the dielectric material.

To determine such differences quantitatively for all the different dielectrics employed in commercial spark plugs would necessitate a great many time-consuming observations. The writer did not have time for such an extensive investigation, but hopes that the following conclusions drawn from the observations he made may act as a stimulus to those especially interested in improving the quality and durability of insulating materials used in spark plugs.

#### Porcelain

The resistance of all the plugs with porcelain as the chief insulator was very greatly diminished by heating. Even at temperatures from 130 deg. C. — 200 deg. C. the lessening of the resistance was quite noticeable, although possibly not of an order to seriously interfere with the production of an ignition spark when the source of current possessed the power of average commercial ignition outfits. However when one of these plugs with its points separated so that sparking occurred from the central electrode across the surrounding porcelain stem to the shell, was heated to dull redness (about

Figs. 5, 6 and 7—Leakage curves of porcelain plug at dark red heat and at a dull red heat and of a steatite

Fig. 8—Leakage curve of red hot new mica plug

500 deg. C.) and connected to one of the high tension leads of a very powerful high tension magneto of the shuttle armature type, even at a magneto speed of 1200 r.p.m., sparks similar to those of the cold plug could not be obtained. In the air space between the shell and the outer surface of the central insulation, innumerable fine reddish colored sparks were present, which continued for a few moments after the redness had disappeared from the cooling porcelain. As the plug cooled to darkness, the arc flame spark suddenly formed over the surface of the porcelain to the shell, the same as in the cold plug. It may be inferred that with a generator or induction coil of less output, before the sparking voltage over such a plug could be built up, a still further cooling of the plug would have to occur.

A further interesting phenomenon was also observed, namely, that on heating several porcelain plugs of different manufacture a number of times to dull redness, a progressive deterioration of the insulating qualities occurred, so that in the cold state the dielectric resistance was considerably less than before the plug had been alternately heated and cooled. From special tests made by the writer this change in the porcelain appears to be due not to the formation of surface cracks in the material, but to some molecular change of the material due both to the heat and to the passage of the current through the heated porcelain. How much this factor would influence the useful life of a porcelain plug under ordinary usage I am not prepared to state. Undoubtedly, however, this progressive deterioration would markedly shorten the useful life of such plugs when used in certain high-compression engines.

#### Steatite

Unfortunately only one specimen of this type of plug was at my disposal for examination. Broadly speaking, its behavior as regards its resistance was approximately equivalent to that of the better grade of porcelains. It apparently withstands heating somewhat better than most porcelains although when just below dark red heat, the leakage through it is sufficient to prevent the production of a spark by the average ignition generator. Although it deteriorated from repeated heating and cooling, the effect is not quite so pronounced as with porcelain. In the sample examined by me, a number of fine surface cracks appeared after the seventh reheat.

Judging from this single specimen, steatite seems to be somewhat preferable to porcelain, on account of its smaller loss of resistance from reheating, but the tendency to the formation of fine surface cracks after a few reheats is certainly not in its favor.

#### Mica

As was anticipated from our general knowledge of this substance as an insulator, the behavior of the various mica-insulated plugs was variable, and evidently depended upon the variety of mica used. Broadly speaking, the cold resistance of those new plugs in which apparently choice mica had been used was of a very high order, namely, 100,000 meg. or more. With some brands of plugs apparently insulated with mica of medium quality, on connecting the condenser charged to 6000 volts to the plug, the voltage would drop within 3 sec. or less

to about 5000 volts, then more slowly until at the end of half a minute or slightly more, a voltage of about 4250 was reached. At this point the discharge through the mica practically ceased and the deflected shadow of the string would remain stationary for many minutes. Such plugs, therefore, if subjected in the cold state to a voltage not over 4250 at atmospheric pressure and with air as the medium between the electrodes would perform their functions perfectly.

#### Red Hot Mica Plug

Between the hot porcelain plug and the hot mica plug made of high grade mica, there is quite a contrast. Although the resistances of the latter plugs lessen considerably when at a cherry red heat, nevertheless the amount of leakage is usually insufficient to prevent the production of an effective spark ample when an energetic ignition outfit is employed. Thus when the mica plug from which Fig. 8 was taken, was heated to a bright cherry red and actuated by a high tension magneto giving a large secondary current output, the arc flame spark from the central electrode over the insulation and air space to the shell was practically undiminished as far as the eye could detect even at a magneto speed as slow as 50 r.p.m.

After repeatedly heating and cooling the mica plugs it was observed that their resistances when cold, like those of the porcelain plugs, progressively decreased although more slowly. Thus in the case of a high grade mica plug with an original resistance when cold of 202105.2 meg. after heating and cooling 15 times, the cold resistance was found to have dropped to 13684 meg. The resistance when hot of this plug is now 96.6 megs. In spite of this great drop in resistance this plug is still capable of performing its function in an engine.

#### Surface Leakage

As mentioned above, it is practically impossible to differentiate between the leakage that occurs over the surface and that through the substance of the dielectric, owing to the particular shape and dimension of the insulation. Certain porcelain plugs, however, after being tested, can be partially dismantled and an approximate idea obtained of the extent of leakage liable to occur when the greater part of the central metal electrode has been removed from contact with the insulation, the metal shell of the plug, being left in contact with the insulation. As is well known, in damp weather, before the engine has become warm, considerable leakage occurs over the moist outer surface of the plug. In a few minutes, however, this moisture is driven off by the heat and its effect disappears. When that part of the plug within the cylinder becomes really hot and is in contact with ionized gas, it is conceivable that considerable escape of the electric charge takes place over the heated surface of the insulator.

To investigate this question the resistance of a new porcelain plug was measured cold and was found to be 133561.6 meg. After being heated ten times to 500 deg. C. its total resistance cold was 8450.7 meg. Its resistance hot was 3.157 meg. The central stem of this plug was removed and its end-portions were sawed off. These end-portions were then replaced in contact with the respective ends of the hollow porcelain tube and held firmly in position by a semi-circular spring clamp to which the high tension lead was attached. The shell

of the plug was grounded through the high tension switch  $S_1$  as usual.

The resistance cold of the plug was now 458015.2 meg. The total resistance being 8450.7, by the usual formula

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$$

the resistance of the hollow porcelain was 8609.7 meg. The dismantled plug was then heated on its inner end to 500 deg. C. Its resistance  $R$  now measured 42.1 meg. Previously, its hot resistance was 3.157 meg-ohms, and by the above equation the resistance of the porcelain is found to be 3.41 meg. The surface leakage resistance in this case therefore was so great in comparison to that through the substance that it is negligible.

Stated broadly, the general effect of the leakage is to diminish the intensity of the current of the spark and when great enough, will cause complete failure of the spark. To get a clear conception of the somewhat complex phenomena concerned in the formation of the spark in the heated plug, it is better to recall to mind, first, the mechanism of spark production in the dielectric between the points of the plug in the cold state. This may be briefly summarized as follows: In the usual high tension ignition source, interruption of the primary current gives rise to a more or less rapid change of the magnetic flux in the iron core of the primary. Since the primary winding is surrounded by the fine wire secondary winding, both windings being magnetically fairly closely coupled, the changing flux generates by induction summative electro-motive forces in the numerous turns of the secondary winding. The resultant e.m.f. then forces the electric current through the resistance of the fine wire, until the distributed capacity of the winding, and the capacity of the terminals with the attached cables and spark plug have become charged

to a voltage great enough to force the electricity in the form of a spark through the ionized gas occupying the electrostatic field between the plug points. If the resistance of the spark plug has become greatly reduced from heating, molecular deterioration, etc., the supply of current from the secondary may not be delivered rapidly enough to the leaking plug to attain the minimum voltage required to strike across the spark gap. Hence the spark would fail, the secondary current passing through the dielectric of the plug. If, however, the ignition source is capable of delivering a large quantity of charging current in a very brief interval of time, the effects of plug leakage are not so noticeable in practice, for in this case there is a greater likelihood of the sparking voltage being attained in spite of the inappreciable quantity of current lost by leakage during the very brief time required for the plug-points to reach the requisite sparking voltage. After the passage of a spark between the plug points, the gap resistance, as is well known, falls for a time to the value of a few ohms; hence, although the heated dielectric of the plug is conducting a small proportion of the total current at this time, nevertheless its resistance in comparison to that of the gap is enormous; consequently, after the potential difference of the gap and its resistance have been lowered by the passage of the spark, only an insignificant quantity of current continues to leak through the dielectric of the plug.

Considering the above, it should be clear that where plugs are liable to become red hot by reason of high compression or other causes, it is advisable to employ an ignition source that is capable of delivering an extremely steep front type of secondary voltage wave. Further, when current begins to flow in the secondary windings of such a source, the reaction of its magnetic field upon that of the primary core should by no means be strong enough to inhibit the change of flux in that core.

### Side View of Liberty Aircraft Engine

*The Liberty engine, which was pronounced one of the greatest achievements in aircraft engine design by both foreign and domestic experts, is a twelve-cylinder Vee engine with 45-degree angle of Vee. It has hydraulically forged steel cylinder with welded-on sheet steel water jackets. With cylinder dimensions of 5 x 7 in. the engine develops over 400 hp. and weighs less than 800 lb.*

# Labor Is Not a Commodity

It Is a Service Involving the Ambitions and Aspirations of the Individual Worker—Formation of a Permanent Co-operative Organization to Solve Labor Problems Unapproachable Until This Is Understood

By Harry Tipper

**T**HE sudden entry into the period of readjustment indicates that the labor problem must be faced, and faced immediately. The cancellation of contracts which are not yet in production, the arrangements for the gradual reduction of other contracts, and the necessity for the absorption of this labor in other work indicate that the turnover of labor is likely to be increased; difficulties on rates of pay and a slacking up of efficiency in production are likely to come up continually for discussion and adjustment.

The question of the rapidity of a reduction in the rates of pay is a point about which some emphatic opinions have been expressed already by representatives of manufacturers' associations and of labor organizations.

It is evident that if the cost of living is to enter into this question of pay the matter may depend upon the financial condition; that is, the inflation of values due to the enormous reserve of gold concentrated in this country by the exigencies of war in a greater measure than the desires of the different lines of production to enter upon a reduced scale of costs.

It is not yet apparent that we shall have any surplus of labor, and the condition in this respect will not be apparent for some months. There are many lines of industry which have been suppressed to a considerable degree by the necessities of war, even if they have not been entirely stopped. And there is a deferred necessity of production in such lines which will demand a large increase in the amount of labor involved.

## Temporary Labor Surplus Possible

It is possible that a waiting tendency in the period of first attempts to analyze the readjustment necessities may provide a temporary surplus of labor in some lines, but there is no evidence at present available which would indicate any immediate general surplus leading to any large degree of unemployment.

These are of course only speculations, as the figures available for the different industries are not sufficiently complete and comprehensive to permit a proper estimate of the deferred necessities and a proper estimate of the release of labor from the war industries. The position, however, does indicate that some time is afforded the manufacturer before these adjustments become acute to lay his plans for an attack on the future labor problem so

that the later period of readjustment will not find him unprepared.

It is necessary, in order to place at the service of the manufacturer the types of organizations which have been considered and adopted in individual cases with notable success in some lines of industry, to depart for the time being from a further discussion of the fundamentals governing the growth and position of labor organizations and discuss the character and validity of some of these plans.

## Organized Labor Totals 14 Per Cent

The percentage of organized labor in this country is estimated as 14 per cent of the total available labor. However, in some occupations the organized labor is a very much larger percentage and is sufficient practically to control the operations of labor in that particular field. It is also true that an organized minority in periods of readjustment can control the actions of an unorganized majority when the problem becomes sufficiently acute. It is to be noted further that even in industries where the labor is not organized to any considerable degree the workers of a particular plant or locality are induced to get together in some temporary form of organization when the acuteness of the problem demands some action.

Any plan considered by a manufacturer to deal with the labor problem should be based, of course, upon the probable effect of such a plan in influencing the turnover of labor, the productive efficiency, the cost in units of production in comparison with other competitive organizations, the permanence of the machinery of adjustment, and the capacity for adjustment without interruption of the productive necessity.

Such a plan therefore must take into consideration the fact that organization of labor has increased almost 50 per cent since the war broke out in the official record of the occupational organizations, and that this increase is very greatly enlarged if it be considered to include the temporary organizations created for the purpose of settling disputes which have arisen in one occupation or another in various localities.

In fact, the manufacturer must be prepared to admit that some form of organization among the workers is likely, is to be expected, and must be considered in the formation of any plans to deal with the subject.

The question, therefore, is not a question of fight-

ing the organization of workers, but of meeting the present organized bodies of labor which are not capable of solving the problem for the individual manufacturer, and which are just sufficiently strong to disturb the normal operation without having the power to govern the practice thoroughly with a form of organization which will offer a prospect of solving these questions of stability, incentive, turnover, productive efficiency, etc., in connection with the individual manufacturers' organization, and which will at the same time provide the worker with a voice in the settlement of the conditions of his work at least as important as the voice which he secures in the determinations of his occupational labor organization.

Such an organization, moreover, should be of a character sufficiently permanent and continuous in the working of its machinery, to settle many questions before they have arrived at the point of dispute, and have created the mental dissatisfaction or the physical interruption which seriously disturbs the productive operations.

### Immediate Results Impossible

It is not worth while to discuss any such plan without suggesting to the individual manufacturer that the results to be expected from an organization within the industrial manufacturing unit cannot be secured immediately. It is clear that during the first part of the life of such an organization the efforts of such a body would not offer any advantage over the present methods of settling the questions of dispute between employee and employer, and would not indicate any of the economic benefits to be derived therefrom.

Unless the manufacturer is prepared to decide upon an organization with full confidence that it is fundamentally right and possesses possibilities of growth which must make it of value in its economic effects, and is therefore prepared to spend the necessary time to establish the machinery to create the working understanding and to generate the confidence which must obtain before any advantage can be secured, the discussions which follow will have little of interest to him and will be of small benefit.

Some time ago a manufacturing organization where the employers were having a dispute with the employees which had resulted in a strike requested the writer to act in connection with the matter because of his knowledge of labor affairs. The request was refused because when the dispute had arrived at that stage an arbiter was necessary and not an organizer.

It is not to be expected that the plans lately announced by four or five of the steel companies and the plans now in motion by one or two of the oil companies and other industrial organizations will be sufficiently formulated in less than 3 years to have established a working basis that will offer any indication of advantage.

In some cases where there has been an atmosphere of confidence between the executives of an organization and its employees established through years of contact, the machinery provided by a plan properly thought out, for the co-operative solution of

these questions, begins to show economic values more rapidly. Unfortunately, such cases are sufficiently rare in industries to make it necessary to emphasize the patience and the study which must be given to the building up of co-operative machinery within the industrial organization, which will provide a basis for the permanent adjustment of industrial relations.

It must be remembered by the manufacturer that the untold centuries of struggle by human beings to arrive at orderly systems of organization which will permit of individual development and at the same time emphasize the co-operative responsibility do not suggest any rapid solution of the whole of the difficulty.

Any of the plans adopted at present by the forward-looking individual concerns can be regarded only as a step in the right direction, and is a suggestion of machinery which can be employed to effect considerable progress in this matter and which will form the basis for future development along a hopeful line.

It must further be remembered by the manufacturer that a continuity of the present warfare between employers and employee, whether in thoroughly established organized groups or in temporarily organized bodies, will increasingly hamper the manufacturer in his industrial activities and remove from his control an increasing portion of this most important problem.

### Labor Not a Commodity

It was stated in the first article written in this series that labor is not a commodity, but is a service performed by human beings involving their individual ambitions and aspirations, their social responsibilities and necessities, and their political opportunities.

No approach can be made to the organization of permanent co-operative machinery for the solution of this problem unless this is thoroughly understood. All economic results arise out of the satisfaction of these human instincts and are directly proportional to the degree of satisfaction or discontent. In the final analysis the problem of human labor is a spiritual problem, its causes buried in those deep-seated instincts of growth and development which distinguish the thinking animal.

After all, however, it is true in human affairs as in mechanical affairs that the practical application of the principles limits their usefulness. The next article, therefore, will begin a discussion of various plans of industrial organization, analyzing their advantage and disadvantage and the difficulties which have grown out of their existence, as well as the possibilities expressed in their future.

This discussion will begin with the usual industrial organization and the modifications which have occurred in the last 25 years, so that upon this background the individual plans which have been created in some concerns in various lines of industrial work can be thoroughly considered, showing their departure from the usual method, the reasons for that departure, the advantages and future possibilities.

# Four Hispano-Suiza Models

## Lightness, Flexibility and High Mean Effective Pressure Features of This Engine for Fighting Planes

**T**HE Hispano-Suiza is notable for unusually light weight, great flexibility and high power per unit of piston displacement. Simplicity of design and ease of manufacture are also claimed for it. Its simplicity may be judged from a comparison of its number of parts with that of another well-known engine. It is stated that the Mercedes aircraft engine has approximately 900 parts to 400 in the Hispano-Suiza.

All Hispano-Suiza engines are manufactured under the Birkigt patents, which are owned by the Swiss designer, Marc Birkigt, formerly a designer of mining machinery, and the parent company, Automoviles Hispano-Suiza, the builder of the four-cylinder automobiles of that name before the war, with factories at Barcelona, Spain, and Paris, France. The French factory was turned over to the manufacture of Gnome aviation engines shortly after the outbreak of the war. The Hispano-Suiza engine was not adopted for the French air service until December, 1915.

When European factories proved unable to meet the demand for Hispano-Suiza engines in 1916, manufacturing rights were given to the Wright-Martin Aircraft Corp., New Brunswick, N. J., which completed several orders for the French Government. Later, when the United States entered the war, these engines were turned out in large numbers for the American Government.

French aviators quickly took to the Hispano-Suiza engine, and it became the favorite for fighting and pursuit work, especially when fitted to Nieuport and Spad planes. It was used by practically all the leading French aces, some of the most famous being Fonck, Guynemer, Nungesser and Lufbery.

There are two outstanding features common to all Hispano motors, these being the cylinder construction and the method of valve operation. The cylinders are separate steel sleeves flanged for attachment to the crankcase and with the valve seats cut in the heads, but instead of each cylinder having a sheet steel jacket welded to it, it has the customary design for aviation engines. The water jacket is an aluminum casting which makes the cylinders into a block. The cylinders are threaded externally for the greater part of their length and screw into the aluminum casting. This construction means that all working stresses are cared for by the steel sleeves, the aluminum casting having nothing to do except retain the water and carry the camshaft.

The valves are set in a straight line in each cylinder block, there being two to each cylinder, and their center lines are parallel to those of the cylinders. The stems are of very large diameter and hollow, and each valve carries a mushroom tappet screwing into the valve stem. The top of the tappet is hardened, and the camshaft, being mounted directly on top on the cylinder block, operates the valves by direct contact between the cams and the tappets.

Each tappet is serrated on the under side of its head and a serrated washer lies immediately beneath the tappet head. Under the washer are two concentric valve springs. The upper end of the whole valve stem is welded and the washer has two projections which engage with the slots, so preventing the washer from turning.

To adjust the clearance between tappet and cam a special tool is used which makes its fulcrum on the edge of the washer which cannot turn relative to the valve and then tightens or loosens the mushroom tappet, the serrations slipping over each other.

Four models of the Hispano-Suiza engine have been built in the United States. These are the Models A, I, E and H.

Model A has a bore of 120 mm. (4.72 in.) and a stroke of 130 mm. (5.11 in.) and develops 150 hp. at 1450 r.p.m. at sea level. Although formerly used for combat and pursuit work this engine has now been relegated to use in training planes.

Model I, also of 150 hp., is the same as Model A except that it has the new marine type of connecting rod; the magneto drive and the timing are different, and there are some slight changes in the piston mounting.

Although Model E has the same bore and stroke as Models A and I, its output is 180 hp., the compression ratio having been raised from 4.72 to 1 to 5.33 to 1 by increasing the distance from the center of the piston pin holes to the top of the piston. A large Stromberg carburetor (2 in. barrels) allows of high volumetric efficiency even though the speed of Model E is 300 r.p.m. greater than that of the Model I. Model E has been extensively employed in the British SE-5 planes, which are built for fighting and general purpose work.

All three of these models resemble the original design in their essential features, although many details are different.

Model H, which is the 300-hp. model, is of American design except for its basic principles. Twenty-two of these engines have been completed by the experimental department at the Wright-Martin factory in New Brunswick, and tests have shown them to be very speedy and powerful. Model H has a bore of 140 mm. (5.511 in.) and a stroke of 150 mm. (5.905 in.), and differs from the other models also in the design of its carburetor and oiling system.

With the exception of the points of difference outlined above, the Model I may be taken as typical. The two halves of the aluminum crank case are ground so that their faces make a perfect fit, no gasket being used between them. The lower half of the crank case is very deep, forming a large oil reservoir and also serving to impart greater rigidity to the engine.

The cylinder blocks are of cast aluminum and incorporate waterjackets surrounding the heads of the forged steel cylinders, which are made in the form of sleeves threaded on the outside to screw into corresponding threads cut in the aluminum waterjacket. Each cylinder is flanged at the bottom and closed at the top, the upper surface being flat and containing the two valve seats. The cylinder blocks also embody the intake and exhaust passages and the valve ports.

A hollow four-throw crankshaft is used, 180 degrees between throws, the material used being chrome nickel steel, machined all over. Four plain main bearings, bronze-backed and lined with babbitt, and one annular ball main bearing at the rear (magneto end) of the engine carry the shaft, which is supported between the

crank case halves. A double-row, ball-thrust bearing located in the front of the crank case takes the thrust of either a tractor or pusher propeller. The crankshaft is provided with a taper at the front end, having a key for the propeller hub.

Connecting rods are tubular. The new type of rod, which is of American design, is forked at the bottom and bolted to a two-piece bronze box lined with babbitt, two bolts being used at each side. The bronze box bears directly on the crankshaft and the other connecting rod bears on the outer and central portion of the bronze box, the shaft itself working between the forked ends of the straddle rod. Bronze bushings are provided at the upper ends of each pair of connecting rods.

#### Piston Walls Tapered

The cast aluminum pistons are  $\frac{3}{8}$  in. thick at the head, this thickness tapering at the sides to  $\frac{1}{2}$  in. at the bottom. There are four narrow rings in two grooves at the top of each piston, and near the bottom there is one oil ring with a relief just below it. Case-hardened alloy steel is used for the piston pins, which are of large diameter and hollow in construction. These pins float in both sides of the piston as well as in the upper end of the connecting rods, a piston pin lock ring holding each pin in place.

A hollow overhead camshaft operates the valves in each cylinder block, being carried in three plain bronze bearings and driven by two pairs of bevel gears and a vertical shaft at the rear of the engine. These vertical shafts are protected by light steel tubing, and each is made with a screw driver, or Oldham coupling, type of joint slightly below the middle to permit removing the cylinder blocks without dismantling other parts. One of the camshafts—that in the left hand block—besides operating the valves, drives the piston of a small air pump mounted on the valve gear housing. This pump is used for maintaining pressure in the gasoline tank where the pressure fuel feed system is used. The oil-tight cast aluminum housings which inclose the camshafts and valve mechanism are easily removable.

#### Valves Direct-Operated

Tungsten steel valves with large diameter hollow stems are used, working in cast iron bushings. They are set parallel to the cylinder axes and the overhead camshafts operate them directly by making contact with case-hardened, flat-headed adjusting disks at the upper end of the stems, rendering rocker arms unnecessary. Each valve is held to its seat by two concentric helical springs, either one of sufficient strength to insure proper seating if the other breaks. Clearance between the cam contour and the adjusting disks may be easily corrected when necessary by means of serrated washers pressed upward by the springs which hold the adjusting disks in place, permitting easy turning with a special wrench which displaces the adjusting disks angularly in the valve stems. The whole assembly can slide freely lengthwise, although the spring retainer washer is held in place angularly by tenons engaging slots in the stem.

The inlet valves open at the same time that the exhaust valves close, 10 deg. after top dead center. The exhaust valves open 45 deg. before bottom dead center and the inlet valves close at 50 deg. after bottom dead center.

#### Pressure Oiling

Lubrication is by pressure, a sliding vane eccentric pump mounted vertically in the lower half of the crank case, directly under the rear end of the crank shaft, forcing oil to the bearings, etc. This pump is driven at 1.2 times crank shaft speed by the same bevel gear on the crankshaft that drives the vertical shaft at the rear

of each cylinder block. Where an oil radiator and reserve reservoir are used, practically no oil is carried in the sump of the crankcase, this being known as the dry sump system. In this case the oil is circulated through the oil radiator and reservoir by a gear pump situated on the magneto support bracket at the rear of the engine and driven from an extension of the crankshaft.

Oil is driven first from the vane pump through the filter in the lower half of the crankcase and then through a steel tube cast in the lower half of the case with connections leading to three of the main bearings, where the oil enters the hollow crankshaft and is distributed to the four crank pins. Oil is fed to the outer connecting rods through holes in the inner rod and is then diffused as a spray which combines with the oil thrown from the main crankshaft bearings to lubricate the cylinders, pistons and piston pins. At the front main bearing there is a by-pass leading around the outside of the bearing to a tube which runs up the front end of each cylinder block, the lubrication of the bearing itself being taken care of by an oil lead. Passing up the tube at the front of the engine, the oil is delivered to the hollow camshafts which distribute it through small holes to the bearings, cams, valve tappets and stems, the excess oil escaping through the rear end of the camshafts in the form of a stream which lubricates the vertical shaft bearings and driving gears before returning to the crankcase through the vertical shaft housing at the rear of the engine. The filter in the crankcase is fitted with a removable screen to permit easy inspection and cleaning.

#### Transverse Shaft Drives Magnetos

The two eight-cylinder Dixie type 800 magnetos are carried on a bracket at the rear of the crankcase. They are driven at crankshaft speed by a transverse shaft through gear type couplings. A small shaft at right angles to the transverse shaft is located directly beneath it in the center of the magneto support bracket and communicates the drive from the crankshaft to the transverse shaft by means of a helical gear. The left hand magneto runs clockwise and the right hand one anti-clockwise. Each magneto supplies two spark plugs in each cylinder, the plugs being located in bushings in the aluminum cylinder blocks. One of the bushings is on the inboard side of the combustion chamber and the other on the outboard side.

The firing order is as follows, L indicating the left hand block and R the right hand block, facing toward the propeller end of the engine and the numbers denoting the position of the cylinders, facing toward the rear of the engine: 1L-4R-2L-3R-4L-1R-3L-2R.

The spark advance on the Models A and I is 20 deg. and 20 min. before top dead center. That of the Model E is 25 deg. before top dead center.

#### Starter Equipment

Equipment with an electric or air starter is made possible by bolting a suitable bracket in place of the magneto support and oil pump assembly. A single-unit motor generator system may be used for a combination starter and long distance wireless outfit, as the magneto wireless connection has a radius of only approximately 5 miles. Engines used in pusher type seaplanes are sometimes equipped with a geared-down hand starting crank with a small magneto to give a hot spark at low speeds.

When arranged for gravity feed, the gasoline tank is placed so that it will give 1 to 2 lb. head at the carburetor for any position of the machine when in flight. Where pressure feed is used, the pressure is maintained by the pump located on the valve gear housing of the left hand

# Factors Concerned in the Causation of Industrial Accidents

## The Results of Investigations Among British Munition Making Establishments— How and Why the U. S. Bureau of Labor Differs with Some of the Conclusions

OF the many valuable contributions to the literature of industry which have come into being in the form of reports of the Health of Munition Workers Committee of the British Ministry of Munitions, by no means the least enlightening is the record of the investigation of the factors concerned in the causation of industrial accidents by H. M. Vernon, M.D. It is one of the many studies made by various authorities on different phases of the problem of conserving health and energy among the munition workers. The investigation covered by the report under consideration was made to determine, by means of a study of the distribution of accidents and output through the hours of the working period, the importance and effect of certain factors which influence accident occurrence.

During periods ranging from 9 to 21½ months, 50,093 accidents, occurring in four munition factories, were analyzed. The injuries considered were cuts, foreign bodies in the eye, burns, sprains and injuries incurred one or more days before they were reported.

Dr. Vernon, in his report, states that the factors concerned in accident production may be classified as:

1. Those of personal origin (such as nervous and muscular co-ordination in relation to speed of production, fatigue, physical influence, nutrition and alcohol consumption).

2. Those depending on external conditions not directly under the worker's control (lighting, temperature, humidity, ventilation and defects of machinery and absence of suitable protective mediums).

During the investigation, according to the report, "No attempt whatever was made to investigate certain factors such as defects of machinery and absence of guards."

### The Relation of Accident Occurrence to Output

The conclusion of the investigator is that most industrial accidents may be regarded as unavoidable and that "accidents depend, in the main, on carelessness and lack of attention of workers." In considering the relationship of the number of accidents to output, it developed that in one factory making fuses, during the morning hours the number of accidents increased with the output, and both accidents and output reached a maximum in the last or next to the last full hour of work. The conclusion arrived at by the author was that this increase of accident was "due partly to increasing speed of production and partly from increasing inattention arising from the thought of pleasure to come." It was found that among night workers, on the other hand, while the output followed a course similar to that of the day shift, the accident incidence, except that of eye accidents, was entirely different. It was found that the greatest number of accidents happened at the early part of the shift, and that the number gradually fell off during the night to about one-half of its initial value. The author attributes this to "the fact that the night-shift workers started work in a careless and excited state and calmed down gradually during the night."

In the other three plants, where 6, 9.2 and 12-inch shells were made, the hourly variation in the speed of production was very small, and the accidents incidence correspondingly steady.

The influence of fatigue on accidents to women was shown by the fact that the 12-hour day worked in the fuse factory

caused such fatigue in the women as to make the number of accidents occurring among them 2½ times as great as in a subsequent period during which they worked a 10-hour day. Reduction of hours from 12 to 10 per day had no effect on the number of accidents among the male workers. The report states that:

Even during the 10-hour day the women showed distinctly more signs of fatigue than the men did during the 12-hour day, not only by reason of the above-mentioned ratios between afternoon and morning accidents, but because the women showed a more rapid increase of accidents in the course of the morning spell of the 10-hour day than the men did in the same spell of the 12-hour day. Probably women would need to have their working day reduced to 9 hours before they escaped fatigue as successfully as the 12-hour day men. A 12-hour day of actual work in industrial pursuits was almost unknown in this country before the War, and has been exceptional during the War, so we may confidently conclude that as a rule fatigue has but little influence in the causation of accidents in men. If men worked longer than a 12-hour day, or even if they worked 12 hours or less upon heavier types of work than those imposed on them at the fuse factory, they would doubtless be liable to fall into the condition of excessive fatigue shown by the women.

### Artificial Lighting Cause of Accidents

In a discussion of the comparative frequency of accidents among the day shift and among the night shift, Dr. Vernon states that the alcohol consumption factor, in so far as it operates at all, must tend to increase night-shift accidents more than day-shift accidents. Artificial illumination, he said, had the same tendency; the excess of eye accidents occurring during the night shift over those occurring during the day shift was shown to be due to artificial lighting. The report states that temperature had a decided effect on accident occurrence, since "accidents increased considerably as the weather grew colder, and diminished as it grew warmer. In one factory, accidents among women were nearly 2½ times as numerous when the temperature was at or below freezing point as when it was above 47 degrees, while among men they were twice as numerous." The author points out that inasmuch as lower temperatures were experienced during the night-shift hours, accidents would tend to be more numerous then, and after study of accident incidence at various temperatures he recommends as the optimum temperature in munition factories one of 60 deg. to 64 deg. F.

Notwithstanding all these factors tending to increase night-shift accidents over day-shift accidents, it was found that, grouping all kinds of accidents together, fewer accidents—16 per cent less among the women and 15 per cent less among the men—occurred during the night shift than during the day shift. The author concludes that the determining cause was the influence of the psychical factor—the workers' mental attitude.

The following suggestions as to accident prevention are given:

In the first place, it is well to recognize that many industrial accidents, probably the majority of them, are unavoidable, and that at best one can only hope to reduce their number, and never to eliminate them entirely. Moreover, we have seen that speed of production is an extremely important factor in their causation, and often the most important factor of all, so any improvement of

factory conditions which increases speed of production inevitably tends to a more than proportional increase of accidents. Accidents depend, in the main, on carelessness and lack of attention of the workers, and so the more one can eliminate this lack of attention and increase the concentration of the worker upon his work, the more will accidents be reduced. As has already been pointed out, one wants to induce in all the workers throughout their hours of labor the same mental outlook as is present in the night-shift workers in the early hours of the morning. These workers have for the most part forgotten the pleasures and excitements indulged in shortly before coming on to night shift, and they have nothing but an unexhilarating breakfast and bed to look forward to. Such a mental state is impossible of achievement by the day-shift workers, but something in the way of mental calm and equilibrium can be attained by stopping all conversation except that relating to the work in hand. If the workers would consent to it it would be a good plan to induce temporary deafness by plugging the ears, and so shut out the noise of the machinery, which is in itself an important cause of distraction and fatigue. Again, if it were practicable—though it is seldom that it can be so—it would be of value to shut out the sight of surrounding objects by separating the lathes or other machines from one another by partitions. The worker, left to himself without sound or sights to distract his attention, could then concentrate himself entirely on the work in hand. It might be said that the monotony would be so great that nobody would stand it, but would it not be better to work for two 3 or 3½ hour spells every day under such conditions if the worker could thereby earn as much as he does under present conditions in two 4-hour spells? However, these conditions are mentioned only as an ideal, which should be aimed at wherever possible.

The careless habit of mind can also be diminished by stricter sobriety. There can be no doubt that the less alcohol the worker consumes the better it is for the quality and quantity of his work, and for his accident immunity. This applies especially to alcohol consumed by the day shift in the dinner hour and by the night shift shortly before coming on to work. The inclination of the day-shift worker to drink during his dinner hour can be combated to some extent by establishing factory canteens, where good food is obtainable at cost price, or slightly below it. The worker would then find it more convenient to stay in the works during his dinner hour than to go home, and so would escape the temptation of drinking. . . .

The production of excessive fatigue with its accompanying increase of accidents can be almost entirely avoided by choosing suitable hours of labor. It can also be combated by the introduction of seats for the standing workers to rest on occasionally when they are not actually working, and of the most suitable seats possible for sedentary workers. . . .

We have seen that even moderately defective lighting produced a considerable increase of eye accidents, and it is probable that it had some effect on other types of accidents as well, though it was not big enough to be detectable. Hence, the adequacy of the lighting of a factory should be tested from time to time by an expert, while the eye accidents could be reduced or eliminated by the use of suitable goggles. Though it might not be worth while to insist on the majority of workers using these goggles, it should be made a rule that they be worn by the grinders of tools and other specially exposed workers.

Following this, the report pointed out the importance of the temperature factor in accident causation, which, as the author said, was self-evident and needed no discussion. He suggested that thermometers be installed in the shops, and be consulted regularly by those in control of the heating.

#### U. S. Labor Bureau Differs

In a recent issue the Monthly Labor Review of the Bureau of Labor Statistics of the United States Department of Labor pointed out that some of the conclusions arrived at in Dr. Vernon's report were at variance in some particulars with those suggested by the compilations of the Bureau. The first difference noted was in regard to the importance of the interval after the nominal beginning of a working period in which the worker does not get at work. Dr. Vernon, on the one hand, thinks that the inclusion of this period in the tabulation introduces serious elements of error. The Bureau, on the other hand, holds that its data seem to indicate that the essential form of the distribution curve is not materially altered thereby. It is pointed out by the Bureau that it is the form of the curve, rather than the precise number of cases in a given division, that is the important matter.

The Bureau also differs with Dr. Vernon in his feeling that sufficient attention has not been given to the interval between the occurrence of an accident and its treatment at the dressing station. A large amount of material, based on dressing station reports, has been compiled by the Bureau, and inde-

pendent reports made by foremen and casualty clerks have also been studied, without the finding of any material difference in the distribution curves.

Dr. Vernon gives much importance to the mental attitude of the worker in certain cases. He says "inclination drove the day-shift women to attend the dressing station toward the end of the morning spell, but drove the night-shift women to attend it at the beginning," and "it follows, therefore, that in almost all accident statistics one must make a considerable allowance for these remarkable variations in the strength of the worker's inclination, though it is impossible to obtain a numerical measure of the extent to which inclination will falsify accident statistics."

The Bureau of Labor Statistics holds that "careful and extended experiment in the tabulation of various degrees of severity of accident, ranging from dressing station cases to those of not less than six weeks' disability, does not indicate that the influence of these mental states, though present beyond question, is of sufficient importance to modify the form of the curves.

The Bureau feels that Dr. Vernon has not given sufficient consideration to the importance of defects of machinery and absence of guards as causes of accidents. The other points of difference between the findings of Dr. Vernon and of the Bureau of Labor Statistics are set forth in the following paragraphs, which give first an extract from the former's report, and immediately after it the comment of the Bureau upon it.

#### Detailed Differences in Conclusions

*Speed of Production.*—The incidence of accidents (from hour to hour) showed a qualitative resemblance to the output variations, and it was concluded that varying speeds of production is the psychological responsibility for day-shift variations in accidents in men, though the night-shift output followed a similar course to the day-shift output, the accident incidence was entirely different. It was at a maximum at the beginning of the shift, and gradually fell the whole night through. This was due to the fact that the night-shift workers started work in an excited and careless state, and gradually calmed down during the night.

This contradiction between the day and night results is scarcely adequately explained by the difference in mood of the workers which is pointed out. That the situation is a very complicated one is further emphasized by the compilations of the Bureau, which indicate that for varied and extended kinds of work the morning spell presents two portions. In the first of these output and accidents both increase—accidents the more rapidly. In the second output continues to increase while accidents decline. Any complete explanation of accident distribution must take account of such cases as these as well as of those recorded in the memorandum.

*Fatigue.*—The influence of fatigue on accidents to women was strikingly shown in the fuse factory. The women's accidents were two and one-half times as numerous when they were working a 12-hour day as in a subsequent period when they were working 10 hours per day.

This, taken with other evidence presented and confirmed by the studies in other directions recorded in earlier memoranda, is a most important indication of the care needed in introducing women into work of this character. It is perhaps the most important practical finding of the memorandum.

*Psychical Influences.*—At all the factories the night-shift workers suffered fewer accidents than did the day shift. This was not because the output was smaller, as at the fuse factory it was distinctly bigger by night than by day. It was psychological in origin, and due to the night-shift workers settling down to a calmer mental state than the day-shift workers, and so becoming less careless and inattentive. The physical factor is one of the most important in accident causation.

Attention should be called to the fact that while these workers showed lower rates at night there are sorts of labor in which the night rates are constantly higher. It is difficult to understand why calmness should come at night to these workers and not to mechanics and toolmakers engaged in very similar tasks in other factories. It is impossible not to suspect that some other factor needs consideration.

*Alcohol Consumption.*—Indirect evidence as to the effects of alcohol consumption was obtained.

The conclusion of the author is that the influence of alco-

hol consumption is manifested more in the night shift than in the day. This conclusion is strongly confirmed by the experience of a large steel mill studied by the Bureau. In this mill it was found that the rates of discipline for alcoholic indulgence were from 2 to 10 times as great by night as by day. There was another interesting feature, namely, that both accident rates and the per capita use of alcoholics were declining during this period more rapidly for the night than for the day shift.

**Lighting.**—Accidents due to foreign bodies in the eye were 7 to 27 per cent more numerous in the night shift than in the day shift, though all other accidents were considerably less numerous. This was due to the artificial lighting, as the excess of eye accidents was most marked in the worst lit factory.

This is one of the most positive evidences of direct effect of lighting on the accident rate that have been offered. In most cases the lighting effect is so much complicated with other factors as to make it doubtful what its precise influence is.

**Temperature.**—Accidents were at a minimum at 65 to 69 deg. Fahr. and increased rapidly at higher temperatures and slowly at lower temperatures. Continuous records were kept of the town in which the shell factories were situated, and it was found that in all of them the accidents increased considerably as the weather grew colder and diminished as it grew warmer. In one factory the women's accidents were nearly two and one-half times as numerous

when the temperature was at or below the freezing point as when it was above 47 deg., whilst the men's accidents were twice as numerous.

In this connection it should be stated that in steel mills extra men are frequently employed in the summer as "spell" hands to relieve the regular crew. This introduction of relatively inexperienced men may be quite as important as the direct effect of summer heat.

**Prevention of Accidents.**—Accidents are largely due to carelessness and inattention, so they could be diminished by preventing the workers from talking with one another in the shops.

It was found that the women suffered twice as frequently from sprains as the men, and were especially liable to wrist sprains at the fuse factory, as they had not strength sufficient to push home the clamping lever of the lathes. The women at the shell factories suffered nearly four times more burns than men, chiefly from hot metal turnings. Hence the sprains could be reduced by alterations in the machinery and the burns by protecting the hands.

The conclusion that "carelessness and inattention" are largely the cause of accidents is not borne out by the studies of the Bureau. It may be stated, however, that ignorance and inexperience are largely the cause of accidents and that adequate training in the skillful doing of work will diminish them. The more closely the accident problem is studied the more evident does it become that skill rather than care is the remedy so far as minor injury is concerned.

## Army Airmen Fly Thousands of Miles

ARMY airmen are flying thousands of miles from field to field in the Middle West and Southwest, from the Atlantic to the Mississippi and through the Middle West and Southwest. Little is heard or seen of them even by the inhabitants of the country over which they pass. The following entries in the log of one airman who flew 1700 miles from Scott Field, Belleville, Ill., to Kelly Field near San Antonio, Tex., give a good idea of the work done in developing the school of the flier in America.

Captain F. M. Bartlett covered the 341 miles between Belleville and Clark Field, Memphis, in 3 hr. and 5 min. at an average speed of 110 m.p.h., favored by a stiff wind from the Great Lakes and at an altitude of between 7000 and 9000 ft. On the second leg of the trip between Memphis and Payne Field, West Point, Miss., wishing to stop for lunch, he descended and was close to the ground over an abandoned race track when he suddenly found the air so thin that he knew he could not get off this ground once he landed. He had difficulty in getting back to the upper air currents again, but by following a flock of birds which flew in an ascending circle, he secured enough altitude to continue. Approaching West Point, Miss., fine air was again encountered, but over this town he ran into an electrical storm and was forced to descend.

With clear weather the next day, he made the 230 miles between West Point, Miss., and Lonoke, Ark., without a stop, though his gasoline gave out just as he arrived over Eberts Field, which is near this point and Little Rock. Here bad weather held him up for 4 days.

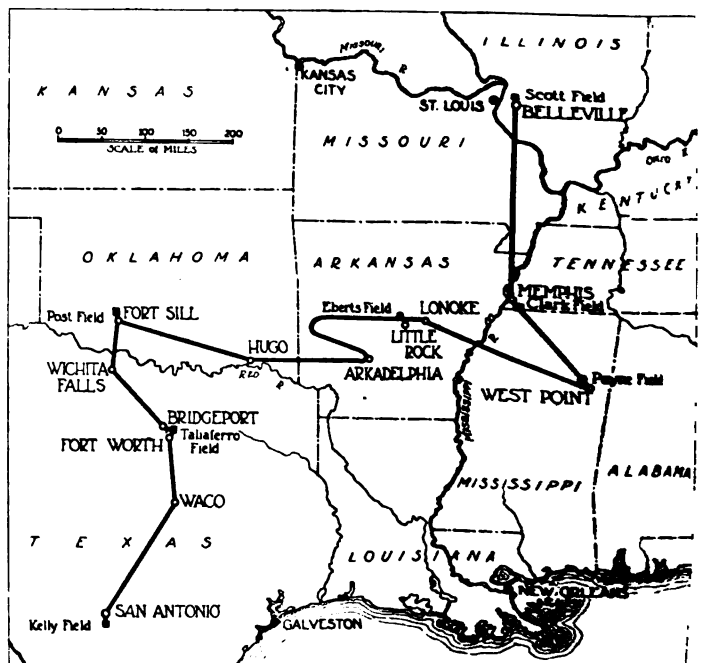

The 450 miles of the next leg between Eberts Field and Post Field, Fort Sill, Okla., which had not been covered before in an airplane up to this time, proved the hardest task in his whole trip. He made the distance, however, in 9 hr. of difficult flying over the Ozark Mountains and came down at Hugo, Okla., for gas.

He had made his course straight from Little Rock over the Ozarks in the air line for Fort Sill, but with nothing but a rough carpet of high hills and thick timber under him as far as he could see, and on account of the bad weather he abandoned the air line to the west and veered to the south. In the 60 miles in this direction from Hugo he encountered a gale of such force as to fell trees below him. He attempted to rise over it, was caught in a large wedge of black clouds, held in the grip of the storm and for 35 min. hung over Arkadelphia, Ark. His plane settled from an altitude of 6000 ft. to 3000 ft. and drifted about 2 miles side-wise when he finally broke through the storm and came out miles off his course.

Between Fort Sill and Wichita Falls, Tex., he again met

bad weather and had to be satisfied with a short mileage that day, not making Taliaferro Field, near Fort Worth, as he had planned. From the Falls this latter distance is 110 miles and Captain Bartlett again failed to make it on the day following, running into a stiff gale which held his ground speed down to 25 m.p.h. and he landed in the dusk at Bridgeport, just short of his destination.

The next day he made Fort Worth without trouble, but, leaving this post at 6.30 a. m., he encountered winds which shifted from south to east to north. This weather developed into a heavy storm and he was forced to land at Waco. Waiting here for the storm to pass he took off again under black clouds which hung as low as 600 ft. and with a strong south wind along the ground. He climbed to 3000 ft. and there found clear air and a brisk north wind. Corn husks blown from the ground followed him and various birds carried by this wind flew above him at 5000 ft., an unusual altitude for them. He finished his 1700-mile flight at 3.30 p. m., it having taken him from 6.30 in the morning to come from Fort Worth, a distance of some 295 miles.

# A New British Coke-Fired Steam Commercial Vehicle

Three-Ton Chassis Having Automatic Control of Steam Generating Functions and Manual Control Devices Arranged the Same as on a Gasoline Vehicle

**T**HOMAS CLARKSON of the National Steam Car Co., Chelmsford, occupies a unique position in the British motor vehicle industry. He was one of the pioneers in steam car development and has remained faithful to this form of motive power through all the years since the beginning of the industry in spite of the popular preference for "gas." Mr. Clarkson's work has been mainly in the field of commercial vehicles, and he has produced some very successful types, his London steam buses being particularly well known. His latest creation, the type IX chassis, is especially designed to meet war conditions in Great Britain. These conditions demand that a home-produced fuel be used, and the boiler is so designed that either solid or liquid fuel can be burned under it.

As there are a very large number of drivers accustomed to the control of gasoline vehicles, it was decided at the outset to standardize the controls of this new steam chassis, in order that a driver who has operated a "gas" vehicle can immediately operate the new vehicle, and will find each pedal and lever in the usual position and performing the same function as that to which he has been accustomed. In addition to the steering column there are a clutch pedal for the left foot, brake pedal for the right foot, side brake lever and change gear lever.

Experience having proved conclusively that an engine, whether steam or gasoline, cannot develop its full power unless it has sufficient piston speed, it naturally follows that in order to meet the extreme condition of heavy loads and soft ground, and light loads and hard ground, at least two gear ratios are necessary between the engine and the driving wheels. In the past it has been held that a steam engine having a wider range of flexibility than a gasoline engine could be fitted to a commercial vehicle without a gearbox, and many vehicles have been so constructed. It means, however, that in order to meet the heavy load and soft ground conditions a larger engine is necessary than would meet the ordinary working conditions, and one is led to the inevitable conclusion that an emergency gear ratio should be provided for this purpose.

Once we have admitted the principle of the gearbox to the steam motor two important further advantages can be immediately secured.

The construction of the engine may be greatly simplified by the entire omission of the reverse gear, the necessary reverse motion of the vehicle being obtained by the introduction of two additional wheels in the gearbox. It should

be remembered that the reverse gear of an engine is rarely being used, but is always being subjected to wear. It is costly to make and to maintain, and therefore the employment of the one-direction engine is a distinct advance in simplicity and general efficiency.

The other advantage resulting from the adoption of a gearbox and clutch is that the engine can be run "free." This is useful not only for warming up in the morning, but when making long waits the engine can be allowed to turn over quickly, and in this condition the vehicle may be left for hours, the engine looking after the maintenance of water feed, steam pressure and lubrication.

In an actual test this chassis was left with steam up all night, the engine quietly turning round and regulating water feed, lubrication and steam pressure without any attention from the driver. In this condition the vehicle is instantly available for service, and the consumption of coke in turning the engine quietly round in this way is very small.

*View of driver's compartment, showing location of engine and controls*

CLARKSON COMPOUND VEE STEAM  
ENGINE

*The section on one side is through the high pressure and low pressure cylinders and that on the other through the valve chests. Attention may be called to the heavy lagging on the engine cylinders. As the illustration shows, the engine is fully enclosed and self-lubricating*

The "Clarkson" Type IX power unit comprises boiler, engine and condenser. This power unit has been designed primarily for road transport duty, where the conditions are as severe as any likely to be met with, but same is also suitable for marine or portable purposes where a light weight power unit is desirable. The boiler consists of two cylindrical steel shells flanged and bolted together at each end. The shells are each forged and drawn under a hydraulic press, and there is not a single weld or rivet in the boiler. When the two shells of the boiler are unbolted every part becomes accessible for inspection and cleaning.

The outer shell is formed with thickening belts where holes have to be drilled for the attachment of boiler fittings. The inner shell is drilled to receive water tubes which are of the "thimble" type, about 4 in. long and 1 1/4 in. average diameter. These water tubes are not expanded, but pressed into the inner shell and held in position (like the stones of an arch) by the pressure within the boiler. The working pressure is from 300 to 350 lb. per square inch. The maintenance of this pressure is controlled automatically by an oscillating valve which regulates the draft of the fire according to requirements.

**Boiler Fired by Solid or Liquid Fuel**

The boiler is designed to be fired by either solid or liquid fuel. In the case of solid fuel it is fed through the central tube from the top. A superheating coil surrounds the central tube. The temperature of superheat is 620 deg. Fahr.

On a 3-ton coke-fired truck it is necessary to replenish the fire every 12 or 15 miles.

The supply of water to the boiler is by a pump operated by the engine at a reduced speed. The supply of water is controlled automatically by a reciprocating float which acts upon the foot valve of the feed pump in such a manner that as the float rises with the water level it prevents the foot valve returning to its seating. As a result the charge of water drawn into the pump barrel returns to the tank instead of being forced into the boiler until such time as the float descends and allows the foot valve again to become operative. This water control maintains the working level in the boiler without any attention from the driver.

**Boiler Fittings**

The boiler is provided with a safety valve of the dual locomotive type which discharges through a vacuum valve

into the condenser. It is also fitted with blow-down valve, feed check and reflex water gage.

The feed water is introduced at the waist of the boiler. The water is not permitted to impinge directly upon the inner shell of the boiler, which is in direct contact with incandescent fuel, but first strikes a thin steel plate between the inner and outer shell, and any deposit from mineral salts contained in the water takes place on the thin steel plate, from which it is readily detached, and falls by gravity to the lowest part of the boiler, there to be removed by the blow-off valve.

As the vehicle can travel from 30 to 60 miles on one charge of water (the mileage is dependent upon the character of the road and upon the load), it can easily be arranged to obtain supplies of clean water—there being no necessity to pick up supplies at short intervals on the roads from ponds and other doubtful sources.

**Engine**

As will be seen from the drawings, the engine is a Vee type tandem compound. Two pairs of high and low pressure cylinders operate upon the same crank at an angle of 90 deg. A very even torque is obtained, as well as a nice balance, insuring smoothness of running and absence of vibration at speeds up to 1500 r.p.m. The engine has the following leading dimensions: High pressure cylinders 3 in. in diameter, low pressure cylinders 5 in. in diameter and a stroke of 3 in. for all cylinders. It is enclosed and self-lubricating. There are two systems of lubrication, cylinder lubrication and general lubrication. For cylinder lubrication a trigger pump is provided which is immersed in a bath of cylinder oil and which forces a drop of oil into the steam pipe every 100 revs., the rule being "little and often" so as to maintain a film of lubricant on the inner surfaces without having an excess.

For the general lubrication of the engine a gear pump is provided, this being submerged in the lowest part of the crankcase and therefore not subjected to air locks. The oil is conveyed under pressure from this pump to all working parts of the engine, including the three journals on the crankshaft, crank pin, eccentric and crosshead guides, this latter being a new development in engine lubrication.

The crossheads are made of steel, casehardened and ground, with about 3/1000 of an inch clearance in a ground cylindrical crosshead guide. At the point of mid-stroke oil is introduced through the crosshead guide on to the working face of the crosshead, and as the length of the crosshead is in excess of the length of the stroke it follows that the hole supplying

Vertical section of engine through crankshaft axis

the lubricant is at no time uncovered by the crosshead.

By suitable channelling in the face of the crosshead and holes leading therefrom to the crosshead pin, this also is placed in communication with the oil pressure feed—an arrangement that has been found to work most satisfactorily.

Piston valves are used on the high pressure cylinders, and flat valves on the low pressure. The operation of all the valves on both lines of cylinders is provided by a single eccentric.

The engine is mounted on the chassis frame in a unique manner, providing for flexibility and stability. One of the illustrations shows how the engine is connected to the frame by two extending arms which terminate in bearings, these bearings embracing trunnions which are securely bolted to the side members of the frame.

At the rear of the engine a cross member of the frame carries a pin which fits into a hole on the pump case of the engine. The engine is thus carried upon three cylindrical supports and it is free to slide upon them. There is no unnecessary constraint imposed upon the engine, and it has a wide basis of support to resist the torque and to carry the weight of the engine direct to the frame without the employment of a sub-frame.

#### Condenser

The condenser is situated in the place usually occupied by the radiator and consists of a top and bottom header united by radiating tubes. As trouble has been experienced in the past in keeping the condenser tight under conditions of road vibration, and the strains introduced with the expansion of the radiating tubes due to the passage of steam through them, an improvement has been made in this condenser by allowing the lower tube plate to move up and down within suitable guides as may be necessitated by changes of temperature in the radiating tubes. The lower header is actually hung upon the tubes and is kept in position within the guides by four short, stiff springs.

The back of the condenser is shrouded and furnished with a powerful fan for ventilation. The fan is driven by a belt from a short lay-shaft running along the side of the chassis from the engine.

At the forward end of the lay-shaft is provided a rotary pump which drains the lower header of the condenser and

# Cultivating Japanese Automobile Field

## PART II

### A Study of Business Methods—How to Make Selling Connections— Considering Distributing Centers—The Arrangement of Selling Prices—Repair Facilities

By Tom O. Jones

Special Agent of the Department of Commerce

**J**APANESE business methods vary so greatly from those in America that they cannot be overlooked as forming a most important factor in the successful retail sale of motor cars.

Practically every large firm in Japan now selling motor vehicles is engaged in importing general merchandise. In some instances the motor business is conducted as a separate department; sometimes new corporations are formed and distinctive names assumed; but in either case the parent company is closely allied with the motor sales.

The foregoing arrangement works to the advantage of the automobile business, for the parent companies have extensive business connections throughout the country, and by far the greater number of cars disposed of in Japan are sold either on a basis of business relations in other lines or on friendship. The reader should bear in mind that there are less than 3000 cars in Japan and the purchase of a vehicle by an influential citizen is known almost immediately by every dealer and every importer.

Friendship without business influence may work for or against the dealer. One representative of a splendid line of American cars outlined the case as follows: "If a friend of mine wishes to buy a car, either of two thoughts run through his mind. One is that I will give him as good a car at as low a price as possible, because we are friendly; the other, that as we are friends, I will feel that he is obligated to buy from me, and therefore I will make the price higher rather than lower because of the friendship." The Japanese dealer requires more than the usual amount of diplomacy in handling his trade. Therefore, as in the United States or in any other part of the world, the financial standing and business connections of the dealer should have most important consideration by the American manufacturer in selecting an agent.

The established large houses generally have branches or representatives in every important city in the country. It is evident, therefore, that the ideal selling agent for Japan is a large Japanese firm operating in general lines,

with its connections already established, and having an organization that is in touch with conditions throughout the country. Such firms are naturally somewhat limited in number and far too few to handle the numerous American cars, were they all to be represented in Japan. In case such a connection cannot be secured, an American firm that has an established reputation should be the choice. According to the manager of one house handling American cars, difficulty is experienced in subdealer selling, the idea being that the subdealer cannot make as low a price as the direct dealer.

Generally there seems no disposition on the part of the Japanese dealer to ask for any unusual financial arrangement. Most of the importers are wealthy firms with an abundance of capital to finance their business on a basis of cash in America against shipping documents. One or two American importing firms stated that they secure better terms on other lines of merchandise and would like to have similar accommodations from American manufacturers of motor vehicles. There is reason to believe that the manufacturers of higher-priced American cars may find it necessary to extend some credit by shipping on 60 or

***E**STABLISHED Japanese general dealers make the best selling agents.*

*As a rule, no unusual arrangements for payment are necessary.*

*Garage equipment is good, and Japanese mechanics are generally efficient.*

*The setting of fixed selling prices in Japan is not recommended. The giving of commissions is a usual practice.*

*American manufacturers should stipulate that the distributor maintains branches or dealer connections in principal cities.*

*Tokyo is the capital, and also the motoring center, having almost one-half of the cars now operating in Japan. The city has several attractive automobile showrooms and efficient repair-shops.*

90 day drafts, if they are to meet European competition after the war. Whether such action will be required on the part of the manufacturer of the lower-priced cars will depend entirely on the competition given by the European manufacturers.

#### Selling Connections for American Manufacturers

An established firm in Tokyo that has branches or representatives in other important cities can secure all the motor-vehicle business available. No company hoping for maximum business should for a moment consider a firm that does not have its home office or a strong branch in the capital.

One or two companies have tried intensified selling in Japan by having one direct dealer in Tokyo for the eastern section and another direct dealer in Osaka or Kobe for the western section. The one American company operating under this plan at the present time is e

periencing difficulties. Its representative in Tokyo is an American house and in Osaka a Japanese house. The American dealers in the capital complain continually that their territory is being infringed upon. The American manufacturer, through his traveling agents, has gone to great pains to investigate many of these complaints and in practically all cases it was found that cars of this make which have come into the eastern territory have been purchased in America and shipped to or by the individual owners. There has been much correspondence, and even with reports from the manufacturer, the Tokyo dealer still feels that some cars are coming into his territory through the other representative, a condition which is not conducive to an enthusiastic promotion of the line.

Within the past few years there has been a great improvement in automobile salesrooms in Japan. Many of the dealers, even the large ones, still confine the display of cars to the garage, but new buildings erected within the last two years or in construction at the present time have showroom facilities that afford window displays on the streets. Generally these rooms are similar to those found in America, but it is seldom that there is more than enough room for the display of two cars on the salesroom floor, although three or four cars are often crowded in.

#### Facilities for Repair Work

Garage equipment in Japan compares favorably with that of the American garage. This is a matter of necessity. A dealer called upon to replace a part that is missing from his stock would require at least six weeks to obtain it from America, even if the part were cabled for. Obviously, it is not good business for him to deprive his customer of the use of the car for six weeks or more, and therefore he finds it necessary to manufacture the part, and for this purpose he must have a fair machine-shop equipment.

Japanese mechanics generally are efficient in their work and when required to make a motor part can copy it quickly and satisfactorily, so that if it will not do permanent duty, it will at least permit the car to be operated until replacements can be secured from America. This must not be taken to mean that Japanese dealers are not disposed to carry parts, for they usually have a good supply, but delays of various kinds may deplete their stocks. In fact, when taking an agency one of their first questions is in regard to what arrangements the American company will make to supply them with parts. Certainly no manufacturer should allow his cars to go into Japan without a plentiful supply of spare parts. While consignment of these parts may be requested, the usual cash basis will not be a very serious obstacle.

While the mechanics learn quickly, the weak point of Japanese organizations is in electrical equipment and finer motor adjustments, but on the whole cars are kept in fair condition by the native garages.

#### Selling on Fixed-Price Basis

The giving of commissions or presents to parties assisting in influencing sales is one that the dealer should consider from every angle. It is one of the older business practices that has crept into the sale of motor cars. In the sale of automobiles the chauffeur is often the intermediary who profits to the extent of \$50 to \$100, handed to him by the dealer when the deal is consummated.

The manager of a company selling one of the low-priced cars in Japan states that many times his company failed to come within three or four parties of the person actually buying the car. By this he meant that a man

about to buy his first car might announce the fact to the steward of his household, who in turn would go to a broker who did business with the motor-car dealer. If it happened that the purchaser lived in some small town and the buying was done from the city dealer, there would be another intermediary.

Under such a system, with constantly varying freight rates, it is difficult to set fixed prices on cars in Japan, and the American manufacturer who insists that the selling be limited to a certain percentage above the landed cost of the cars is imposing a condition which will place a hardship on his representative. Low price alone will not assure the sale of a certain car as against another car of similar type. The commission given to the chauffeur is for his good will and, in the estimation of the Japanese dealer, this is of greater value than a difference in price of equal amount. The dealers claim that practically no Japanese buyer will purchase without the sanction of his chauffeur, and many of them would hesitate to force a sale against the opposition of the chauffeur, because the driver is in position to do them a certain amount of harm by the exploitation of fancied faults in the car.

One dealer interviewed said that he has endeavored to do business on a fixed-price basis and that he refuses commissions to chauffeurs. Taking his word for this, it is a fact that with his line of cars, consisting of three noncompeting types with a wide range in price, he is not getting the business that he should on any one of them. He admits that he is unpopular with chauffeurs, and therein may lie the reason.

European car owners generally recognize this established way of doing business. When one of them remarked one afternoon that he had purchased two new tires, he was asked if he had bought them himself. He said that he had simply sent his chauffeur after them. "I know that he made money on the deal," he added, "but I am perfectly satisfied. He probably bought them as cheaply as I could in any case, and making this extra money adds to his salary and keeps him satisfied. It does not amount to a great deal to me and I get better service and the car gets better attention."

#### Distributing Centers

In making a selling connection in Japan, the American manufacturer who concludes a contract with a Tokyo house should stipulate that branches be maintained or dealer connections of some kind established in Yokohama, Osaka, Kobe, Shimonoseki or Moji, and Nagoya. The relative importance of these largest cities in the motor-car trade is best revealed by the number of cars in operation in each and the character of the districts of which they are trade centers.

Tokyo is the capital and the motoring center. Here are found nearly half the cars now in operation in Japan. Late in August of 1917 license number 1000 was issued in Tokyo, but without doubt there were 100 to 200 other cars in the city that were not registered. The fiscal year for automobile taxation begins on October 1 and cars are operated during the last two or three months of the fiscal year either on a special permit and without a formal license, or use of the old license is permitted on a new car until the end of the year. With additional shipments since August, 1917, the number of cars now in operation in Tokyo can safely be placed at 1400. The city has several attractive automobile showrooms. The dealers' facilities for making repairs and adjustments are good, and a staff of Japanese mechanics and machine-shop equipment is maintained in connection with each of the large garages. Nearly all carry a fair selection of repair parts.

A war balloon in its hangar

# Manufacture of War Balloons in U. S.\*

Observation Balloons Used by American Army an Adaptation of the French Caquot Type—Made by the Large Tire Manufacturers—  
Industry Developed Rapidly

By Allen Sinsheimer

**S**IXTEEN months ago there was no war balloon industry in the United States. To-day war balloons, made in this country, in sufficient quantities and efficiently equipped and manned, form an important part of the American Expeditionary Forces in France. They are huge contrivances, non-rigid, and use hydrogen gas for sustentation. Highly trained observers operate them. Army offensives frequently depend for their success upon their observations.

The United States Government upon entering the war commenced production by working on a sample balloon from the front. Duplication of the foreign-made article was difficult, especially as quantity production was necessary. Balloon fabric manufacture was new in the United States and the material was scarce. It was found necessary to bring over from France a number of experienced men and women to work with the Americans as instructors. Production was speeded up, and through co-operation of the mills looms were secured and the manufacture of the cloth in quantity was started. In addition to an efficient labor organization it was necessary to have

balloon factories especially constructed with free and open floor space and a complete absence of dust and dirt. These were obtained by sacrificing other lines of business, the tire manufacturers aiding considerably and taking on much of this work. All this required time, but when the balloon schools in this country opened and called for balloons their requirements were met immediately. To-day the United States has not only equipped its own army, but in addition is helping to supply the Allies as well. Equipping an army with balloons means more than the original supply. It includes also the replenishment supplies to keep pace with losses by fire, accidents, enemy airplanes and artillery.

In commencing balloon manufacture the Government revived a dead industry; in fact, it practically created a new industry. The spherical balloons, a few of which had been made in this country for use at circuses, were of no value whatever. These were free balloons, while the army balloons are of a captive type, staked to the earth and shaped like huge legless elephants, from which they take their name.

The American army balloon is an adaptation from the French Caquot type. Some years ago Germany developed a fairly satisfactory but somewhat treacherous bal-

\*This article, by our Washington correspondent, was written before the armistice was signed.—Editor.

loon known as the Drachen type. France and England conducted experiments, but made nothing superior to the Drachen. In 1916, at the Mexican border, the United States Army had but one captive balloon, a gift to a national guard battery. So at the beginning of the present war there were no satisfactory observation balloons, and even the German Drachens, unable to reach a height beyond anti-aircraft gunnery, were useless. At this point Captain Caquot of the French Army developed the Caquot type, which has stood the test of the last two years of the war and which has been copied by the Germans. All the Allied observation balloons followed the construction of Caquot. They are non-rigid and designed to remain steady in varying winds and to reach a satisfactory altitude for necessary observations. The gas bag is larger in diameter at the nose, or forward end, which heads into the wind, than at the tail. It is approximately 93 ft. long, with a maximum diameter of 28 ft. Its capacity for hydrogen gas is 35,000 cu. ft. At the tail of the balloon is the "rudder," created of lobes, which steadies it and prevents rocking and pitching.

The lobes forming the rudder are filled with air by the wind alone, the internal pressure depending entirely on the velocity of the wind at different altitudes and on weather conditions.

A diaphragm extends from the nose to a point close to the tail on the lower side of the balloon. This diaphragm, made of rubberized fabric, the same as the entire envelope, has a capacity for 10,000 cu. ft. of air. Wind inlets are so arranged that as the amount of hydrogen gas in the balloon proper decreases, either through cold or by leakage, the balloonette fills with air and thus keeps the shape of the balloon intact. This is impor-

*View of balloon from below*

tant, as the proper functioning of the balloon depends on maintenance of the shape. Thus when the balloon is completely filled with gas, the diaphragm lays parallel with the lower part of the envelope, but as the gas decreases and the air enters between the diaphragm and the lower lining of the envelope the diaphragm rises, and if sufficient air is taken in to fill the capacity of 10,000 cu. ft., it forms the balloonette inside of the balloon.

The life of a balloon is from 1 hour to 7 months, depending on weather conditions and the accuracy of enemy airplanes and anti-balloon gunners. In camps in this country the average effective life of a balloon is 5 months.

Communication between the observers in the balloon basket and artillery officers on the ground is maintained by telephone. The telephone wire is sometimes a separate cable, although the latest apparatus is so designed that the telephone wire is contained in the center of the main cable connecting with the balloon, which is a specially stranded 1/4-in. steel cable.

The windlass controlling the balloon, together with the cable, is mounted on a truck which can travel even while the balloon is in the air.

This is an adaptation of a French invention now manufactured by American companies. Observers in the balloon baskets, which are suspended from the balloon by means of special rigging, are equipped with parachutes for use in emergencies, such as explosion of or firing of the balloon by the enemy.

Many other accessories had to be developed for the balloon service. The production of hydrogen was a problem involving much consideration. The equipment, including the field generators and main supply stations, containers for shipping and storage purposes, methods of

*Gas bottles used in inflating balloons*

*Observers in the basket, with parachutes on outside*

Drawing showing construction of balloon and its rigging

transferring the gas from the containers for shipping and storage and from the containers to the balloons, all required individual attention. Each problem has been worked out successfully, and the balloon service is said to be operated so as to meet the full requirements of the army.

### Weight of Internal Combustion Engines

A CORRESPONDENT of *Engineering* discusses the relative weight of aero and submarine engines and the way in which weights of engines vary with linear dimensions.

Consider any given aero engine weighing, say, 3 lb. per brake horsepower, and also an exact model of this engine made to half the scale of the original. A little reflection will show that this model would possess the following properties:

1. It would weigh one-eighth of the original.
2. It would have the same air speeds, bearing pressures, bearing speeds and stresses (including inertia stresses) if run at the same piston speed as the original (i.e., at double the revolutions) and on the same pressure cycle.
3. If it were worked on the same pressure cycle as the original it would develop one-quarter of the power of the original at the same piston speed.
4. Its weight per brake horsepower under the conditions of 2 and 3 would be one-half that of the original; that is, 1.5 lb. per brake horsepower.

Now an average submarine engine cylinder has a bore and stroke roughly three times that of an average aero engine cylinder, so the latter has a 3:1 advantage on dimensional considerations only.

Accepting the figure 10 for the ratio of weight per brake horsepower of Diesel engine to weight per brake horsepower of aero engine, there remains a ratio of 3 1-3:1 to be accounted for by reduced m.e.p. in large engines, additional metal serving as heat ducts, use of cheaper metals of low strength value, and low piston speed.

# Port Huron Friction Drive Tractor

Disk Drive Combined With a System of Spur Gearing—Two-Piece Bull Gear Used

*The Port Huron tractor. It is designed for three 14-in. plows and has a drawbar pull of 12 hp.*

**A** COMBINATION of friction disk and spur-gear drive is used in the tractor which is being manufactured by the Port Huron Engine & Thresher Co. of Port Huron, Mich.

The reversible, variable friction-drive system comprises two metal driven disks, mounted on a horizontal cross shaft, which are brought into contact, one for the forward

and the other for the reverse movement of the tractor, by means of a lever, with a fiber wheel which is bolted to the crankshaft of the motor. The cross shaft also carries at one end a belt pulley and at the other the main pinion, which transmits the power to the intermediate spur gears connecting with the gears on the driving axle.

With the exception of the differential gears and pinions, all of the transmission gears are machine cut. They are enclosed in a dustproof casing and run in a bath of oil. The larger gears are made of semi-steel. The bevel gears in the differential and the pinion are of open-hearth cast steel, as are also the bull pinions, intermediate pinion and main pinion, all of which are machine cut.

In the construction of the bull gears the hub and spokes are made in one piece, and the rim and gear teeth in another. As a result, when the gear be-

comes worn it is necessary merely to renew the rim, which can be done by removing six bolts.

The engine has a rating of 12-25 hp., and is an Erd of the kerosene-burning type, having four cylinders with a bore of 4 in. and a stroke of 6 in. The valves are located in the cylinder heads. The engine is throttle governed by means of a fly-ball governor, and has a normal speed of 900 r.p.m.

Lubrication is effected by means of a double-filtered splash system with circulating pump. A Kingston mag-

## Constant Compression Engines

By C. K. Salisbury

ONE type of engine especially well adapted for automobile use has received practically no consideration from automobile engineers, mainly because of the extreme difficulty in carrying out any practical design. This is the adjustable combustion chamber type.

Late developments indicate that the main difficulties of design may be quite easily overcome, and as a close investigation shows very high possible thermal efficiencies on partial charges (which would make it desirable for automobile use), a careful study of the efficiencies will be made.

The distinctive characteristic of this engine is that the compression of a partial charge is the same as that applied to a full charge by proportionately reducing the volume of the combustion chamber. With proper form of combustion chamber it is possible to reduce the area of chamber wall exposed to the burning fuel almost directly as the volume of charge is reduced, over a considerable range of charge variation. The explosive pressures developed by partial charges would consequently be as high as those developed by full charges for the same compression. The effect of this is that the thermal efficiency of a partial charge would be the same as for a full charge, provided the expansion was carried only to the same pressure above atmospheric as the exhaust pressure of the full charge. Under these conditions the efficiency line would remain horizontal. As the partial charge is always expanded to a lower pressure than the full charge in this type of engine, the partial charge will show higher efficiency.

### Gain Due to Extra Expansion

The area added to the card by the extension of the expansion line for any partial charge over the area of the same charge expanded only to the exhaust pressure of a full charge is shown by the curve G-H. This curve gives readings directly proportional to the value of the charge and to the efficiency of the engine exploding full charges.

There are limitations as to the point that it is advisable to carry the reduction of the combustion chamber from the standpoint of efficiency. It is not desirable that the expansion line fall below the atmospheric line, as that would reduce the efficiency. This must be balanced against the effect on lighter charges where the combustion chamber volume would not be varied to correspond to the charge reduction. A greatly increased ratio of chamber wall area to chamber volume will also tend to greatly reduce the efficiency. This can be offset by increasing the compression of small charges, even at low speed, above that for full charges, because of the small crank angle at which the compression reaches a high value. Another thing that has a big effect in keeping up the efficiency of small charges is their high rate of expansion. This is almost twice as rapid for the one-quarter charge as for the full charge.

The diagram shows the effect of a reduction of combustion chamber volume to one-quarter of full-charge volume.

The present type of automobile engine loses efficiency quite rapidly when the charge is reduced. The curve

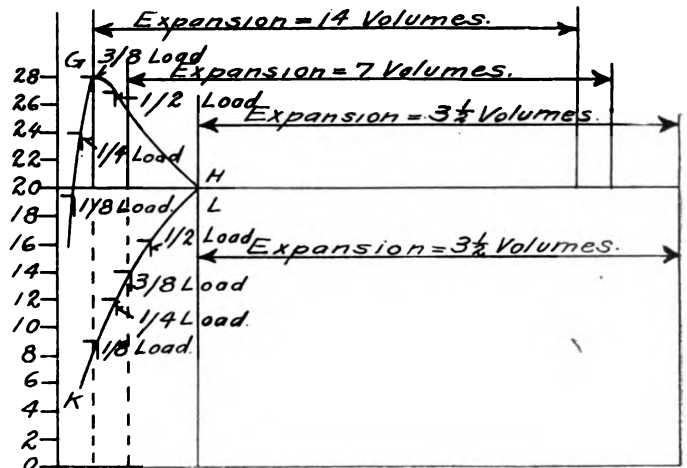

Diagram showing variation of thermal efficiency with load in engines with constant compression (upper curve) and variable compression (lower curve) respectively

K-L directly indicates the thermal efficiency for various charges.

In making a direct comparison between the two types the efficiencies are based on similar engine loads at a fixed engine speed.

The automobile engine of good design is of about 20 per cent thermal efficiency at full load, which will be taken as full load efficiency of the types compared.

At one-half load the regular engine shows an efficiency of about 16 per cent, while the adjustable chamber type would give about 27 per cent. At three-eighths load the regular engine shows about 14 per cent efficiency, while the other type would show about 28 per cent. At one-quarter load the regular engine shows about 12 per cent efficiency, while the other type would show about 24 per cent. At one-eighth load the regular type shows about 9 per cent, while the adjustable type would show about 20 per cent.

If correctly designed, the thermal efficiencies will be fully twice that of the present type over the power ranges commonly used in automobile work.

### Compression May Be Regulated

One very important point in favor of the type is that the compression of the charge may be regulated to obtain best results according to the engine speed. As the automobile engine should have a comparatively low compression for starting and for low speed, considerable increase of compression may be employed at higher speed with consequent increase in thermal efficiency, but with very little increase in engine weight.

The very important feature of this type is that the efficiency is the highest at partial loads. This permits of employing high-powered engines with high efficiency at normal operating loads. An engine having its efficiency highest at full load means either an underpowered engine or inefficient operation.

As pointed out by AUTOMOTIVE INDUSTRIES, the engine of higher thermal efficiency will materially aid in solving the problem of using kerosene. This, taken with the gasoline situation, warrants most careful consideration of the type.

### HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## The Abandonment of National Shows

IT was undoubtedly a wise decision on the part of the National Automobile Chamber of Commerce not to hold any national shows this winter. The great problem for the manufacturers will be to get their production back to a peace-time basis as quickly and as economically as possible. For the time being distributing problems are of minor importance compared with production problems.

There has been as yet no great disorganization of automobile sales agencies. Except in the smaller centers, most of the dealers have kept going, despite the difficulty of getting cars to sell. It devolves upon the manufacturers to see that these dealers who "stuck" in times of stress shall from now on get all the cars they can dispose of. Where agencies have been broken up as a result of the draft or because they could get no cars, the gaps will be filled again in the course of the year as our soldiers return from abroad and as industries that have

been devoted to munitions and similar war work are shut down.

If it had been decided to go ahead with the shows, in view of the short time available we could not have expected much new and novel in the exhibits. Since the entrance of the United States into the war and the gradual conversion of the automobile plants into war equipment factories, little development has been carried on in connection with passenger cars. It would have been impossible to start on new designs now and get exhibition models ready by January or, at the latest, February. And to exhibit the same models as at last year's shows would have hardly warranted the trouble and expense, as it might have resulted in a sense of disappointment on the part of visitors, inasmuch as the holding of an industrial show is always taken to imply the creation of new products.

For the present there is no need to stimulate the market by means of innovations in designs. The public has been unable to get nearly as many cars of the present type as it has wanted to buy, and it will readily continue to purchase these machines through the coming season. This will give the manufacturers plenty of time to develop their 1920 models. In these we may expect to see improvements of a more far-reaching nature than have been witnessed for some time, partly because of the engineering experience gained during the past two years and partly because of altered market conditions as a result of the war. Such radical changes in design demand an extended period of try-out, and if designs are started now there will be ample opportunity to submit the experimental models to rigid tests before starting production on them.

## The Post-War Model

WHATEVER thoughts arise in the mind with reference to the post-war automobile, there is one which should be universal. The pre-war car is not good enough.

We have all had a chance to clean house during the war. Manufacturers generally, in shifting from commercial to war work, have been able largely to idealize their factories and methods because the commercial factor did not stand in the way. In getting back to a peace basis the same thought can apply.

The inaccessible, heavy, uneconomical cars of the past must go. The new product must embody the principles of transportation efficiency. Less weight-per-pound of load, higher torque-per-pound of engine weight, per unit of displacement and per cubic inch of underhood space must be incorporated in the newer cars.

It is true that the development of the last 10 years in automobile design and manufacture was all trending in this direction, but now we have the opportunity to start afresh. The engineer has the opportunity which he has been craving for years. He does not have to confine himself in his designs in order to meet the requirements of the material left over from the year before, nor does he have to keep

within the limits of design as laid down by the sales department, on account of a committed policy.

There will be a period during the next few months when the material situation will make it impossible to start production. That is the time that should be occupied by real engineering design. When the time arrives that the Government again releases for commercial use the stores of steel now held for war, we will be off to a fresh start.

Let us take all we knew before, add to it what we learned during the war in the production of airplanes and other highly accurate Government material and come out with cars which from a standpoint of design and workmanship will leave past models as far behind as democracy has left autocracy.

We can be sure that the designers of Europe have learned much and will profit by it.

Let us not remain behind.

## Price Adjustment

LIKE every other industry that has been more or less upset by the war, the automobile industry is bound to meet with considerable difficulty in regaining its stability. Prices of automobiles have been greatly boosted, first by the rising prices of labor and material and then as a result of the action of the War Industries Board in curtailing the delivery of material to automobile manufacturers and thus artificially cutting down the supply of cars. Undoubtedly a readjustment in price will have to come, but whether it will be immediately or only after a considerable period and whether it will substantially equal the price increase since the outbreak of the war or be less drastic are questions which cannot be answered off-hand and concerning which there are wide differences of opinion.

It is tolerably certain that there will not be any appreciable reduction in material and labor cost for a considerable time to come. In the last analysis it all comes down to a matter of labor cost, because a very large percentage of the cost of raw materials is made up of the cost of labor used in producing them. The wages of labor, on the other hand, must of necessity bear some relation to the cost of food-stuffs and other necessities of life. As the supplies of all of these necessities have been depleted by the war and the prices of some of them are guaranteed by the Government for a definite period, their cost is bound to remain high and there is no immediate hope for a general decline toward a pre-war basis all along the line. Materials will remain high, the wages of labor will remain high, and in so far as the present prices of automobiles are based directly upon these two factors their maintenance for some time to come will be fully justified.

On the other hand, there is a likelihood that some of the later advances in price were based not on increased cost, but on the artificial disturbance of the relation between supply and demand. Price increases in passenger cars seemed to be warranted even by patriotic considerations, as the Government had declared that the passenger car was a non-essential in the winning of the war and that its produc-

tion must be curtailed. There was some evidence that manufacturers were acting in accordance with the spirit of this ruling, for in one particular instance a manufacturer increased the price on his passenger model and at the same time lowered the price on his commercial model which had substantially the same specifications. It was therefore obvious that this price revision was not the result of increased manufacturing cost but of a desire to direct automobile production into channels of more importance to the Government.

Where price revisions have been made for such reasons it is only natural that they should be immediately canceled, now that the war is over. In this connection it must be remembered that owing to the unusual conditions in the automobile market during the past year the general price level has been considerably disturbed. That is, the prices asked for cars do not bear the close proportion to the cost of manufacture and the intrinsic value of the machines that we would expect in normal times. For this reason, too, the fact that some few makers have cut their prices is no sign that there will be an immediate general price reduction. In fact, the consensus of opinion in the industry is that conditions are not ripe for such a reduction.

ONE of the greatest problems of the reconstruction period will undoubtedly be the creation of a demand for airplanes for other than war purposes. This is a problem the solution of which dissolves largely upon the Government, for it was the Government that induced the abnormal growth of this industry and held it down to normal profits. To now turn the industry adrift and let it shift for itself as best it may would certainly not be fair. There has never been a commercial demand for airplanes and one cannot be created over night. But if the organizations are to be held together an outlet must be found quickly. The most promising field for the immediate future is in aerial mail services, and it is most encouraging to learn that fifty additional aerial mail lines are in contemplation.

Of course all orders for military airplanes need not necessarily cease with the ending of the war. We certainly have all the army machines we will need for some time, but the suggestion has been made that our coast defenses should be equipped with hydro-aeroplanes or flying boats and if this is considered essential by the responsible authorities, a considerable volume of business would result.

THERE is much talk, privately and officially, of possible "unemployment." It is idle gossip. This nation is short 4,000,000 immigrants from the last four years. It is short 4,000,000 soldiers and sailors taken for the Army and Navy. Immigration will not increase importantly with peace. Europe offers too much opportunity. The Army and Navy will keep 1,000,000 men for European and sea police duty. It will take six months to muster out the 3,000,000 other men. There will be no "unemployment" because of peace. Some shortage of labor will continue.

## General Price Cut Not Likely

### Manufacturers Not Inclined to Follow G. M. Lead in Reduction—Adjustment Period Necessary First

DETROIT, Nov. 26—Manufacturers generally will not follow the lead of the General Motors Co. and others in cutting prices. In fact, some have already sent out letters to their dealers telling them not to look for a reduction in prices until July "unless the action of some concerns precipitates a price war," in which case, they have assured their dealers they will be protected.

It is pointed out that in general, where prices have been reduced, the reduction is more theoretical than real, as the reduction has been made from prices that never really went into effect because they were announced either recently or when the dealers had no cars to sell.

There is no denying the fact, that as a whole, peace has caught the manufacturer, as well as the ordinary citizen, unawares. The executives have had their minds concentrated on the request of the Government to have their plants on 100 per cent war work by January 1. In the twinkling of an eye, the entire problem has reversed itself, and it is now necessary to get back to a 100 per cent peace basis as rapidly as possible.

In the face of this it is not thought possible that prices can begin to descend on any safe and sane basis until at least the latter part of the coming Spring. Materials are just as high in price as they have been, labor prices are still on the same level and the manufacturing organizations of most automobile and motor parts concerns are on a war basis as regards tools and fixtures.

Selling organizations throughout the country are disrupted, both as regards main dealers and sub-dealers. These will have to be re-established and while this can be carried out fairly rapidly in most cases, it will take time to arrange contracts and get matters lined up on a workable basis.

The manufacturer has been out of touch with the dealer, and the dealer has been out of touch with the manufacturer, and the result is that the dealer does not understand the factory situation. This has already evidenced itself by the letters which have poured in from all parts of the country showing that the ideas of the dealer in regard to what the factory can really do towards

getting back on a pre-war basis are to say the least, very vague.

A question which is paramount in the minds of manufacturers now is, "What does the public really expect?" Former avenues of information, through dealer and sub-dealer organizations, have not been functioning as in the past, and the result is that the manufacturing intelligence department is not as well informed as usual. There is a vague belief in the minds of the public, which has manifested itself in many ways, particularly through the dealer letters, that there are post-war models all ready and waiting for them. This probably would have been the case if the war would have gone another twelve months, but it is not the case now.

There are several tentative cars drawn up on the boards of the manufacturers, but very few of them have gone beyond the outline stage. There has not been time, and the question of getting the plant on a 100 per cent war basis has been so much more pressing, that there has been no time to push engineering designs. Furthermore, the demands of the Government upon the automotive engineering brains of the country have been so heavy that there has not been any talent available.

In Europe, where manufacturers have had four years of war, the situation is different. There are many post war cars designed in Europe, if apparently authentic reports be true. But on the other side of the water the demobilization of industry will be far slower than in this country, because they are far more deeply into it. Furthermore, the departures from pre-war manufacturing methods in Europe have been far more radical.

Orders for materials are being placed very slowly. There is not going to be any overnight turn-over to peace work. It is going to take eight months at least to get back on a solid footing, and during this time all branches of the industry, engineering, sales, manufacturing and purchasing, have a large and delicate task on their hands. It would be a false move at the present time to attempt to educate the public to quick and drastic price reductions, because they cannot logically be followed through.

#### Few Changes in New Maxwell

NEW YORK, Nov. 27—The new Maxwell cars coming through show refinements in detail only, the chassis design remaining practically the same as before. There is no change in price. The gasoline tank has been moved to the rear, the top is Pantasote and the dashboard is mahogany finish. The Johnson carburetor is now furnished as standard equipment.

## 26 Cities Schedule Shows

### Circuit of Local Exhibitions Arranged at Cleveland Meeting of Show Managers

Cleveland.....	Late March, early April
New York.....	Probably February
Chicago.....	Probably March
Philadelphia.....	March
Detroit.....	January
St. Louis.....	Second or third week March
Utica.....	March
Syracuse.....	March
Des Moines.....	Feb. 17-22
Newark, N. J.....	Feb. 15-21
Brooklyn, N. Y {	Cars.....March 22-23
	Trucks.....April 1-5
Indianapolis.....	Not decided
Trenton, N. J.....	Third week March
Boston.....	March
Pittsburgh.....	March
Kansas City.....	Not decided
Louisville.....	Feb. 15-22
Milwaukee.....	January or February
San Francisco.....	March 1-10
Minneapolis.....	Not decided
Harrisburg.....	Not decided
Buffalo.....	First week March
South Bethlehem {	Cars.....Feb. 17-22
	Trucks.....Feb. 24-27
Bridgeport.....	Not decided
Hartford.....	Not decided
Fort Dodge.....	Depends on building

CLEVELAND, Nov. 25—Local dealer shows will be held in 26 cities between January and April, 1919. A definite program of exhibitions was adopted today at a meeting of the National Association of Show Managers in convention at the Hollenden. Many of the dates are tentative, and in several cases the time when the show will be held depends upon the ability to obtain a suitable building.

When the National Automobile Chamber of Commerce last week voted not to hold the national events in New York and Chicago, the dealers all over the country immediately got busy. Plans were set afoot for bigger and better local exhibitions than have been held in previous years and in consequence such exhibitions are to be staged by dealer associations in 26 of the largest cities.

Definite arrangements have not yet been completed for the New York or Chicago shows. The New York dealers plan to stage their exhibition in Madison Square Garden probably in March. Chicago is figuring on the Coliseum, the Municipal Pier or the Siegel-Cooper Building. Minneapolis, which last year put on a truly automotive exhibition, which was bigger than the national shows in New York and Chicago together, will repeat the affair. Several cities have split their show programs into two periods, one for passenger cars and the other for trucks.

## Substitute for Gasoline Tested by Bureau of Standards

Said to Be More Powerful Than Gasoline, Available in Ample Quantities and Entirely Satisfactory—Invention of Army Officer to Be Known As Liberty Fuel

WASHINGTON, Nov. 26—The Bureau of Standards has recently completed a series of tests of a substitute for gasoline which is said to be satisfactory in every respect, to cost less than gasoline, to be available in ample quantities and to give more power than gasoline.

The fuel is the result of experiments of Capt. E. C. Weisgerber, and the formula is a secret. A deal has been completed to commercialize the product and place it on the market.

### Manufactured by Still Process

AUTOMOTIVE INDUSTRIES, making this announcement exclusively this week, can state further that the substitute is in liquid form manufactured by a still process, composed of commodities which are now a drug on the market and which are plentiful enough to assure supplies to meet the future demands. The formula is a secret in the hands of the General Engineering Depot and the inventor. The cost of manufacture is said to be 40 per cent lower than that of making gasoline.

The substitute, which is known as Liberty fuel, is the direct result of experiments by Capt. E. C. Weisgerber, an oil and gas engineer, who was first connected with the Engineering Corps and has lately been working at the Bureau of Standards. He was ordered to conduct the experiments by his commanding officer for the purpose of securing a fuel other than gasoline and more powerful and economical if possible.

### Inventor an Army Officer

The substitute is described as scentless, tasteless and without gasification scent. It is said that its products of combustion are cooler than gasoline. It is reported to be non-corrosive. It does not give out soot or carbon, according to the reports, and starts easier than gasoline.

The quality and specific gravity are changeable at will, it is stated, and the substitute shows no ill effect on the lubricating oil. It will ignite only from spark or flame. No special apparatus is required either in the engine or carburetor or in the manufacture of the fuel.

Tests were held at the Naval Air Station and at Anacostia Flying Field, D. C., in comparison with special "X" quality of gasoline in which the water used with

the Liberty fuel remained below 160 deg. Fahr. and the oil below 130 deg. Fahr.

In the tests by Army officers, mainly conducted by Captain Weisgerber, the new fuel was used in a passenger car, motorcycle, airplane, tractor and truck in comparison with gasoline. In the tests by the Bureau of Standards at the laboratories it was used in a Class B truck engine and a 150 hp. Hispano-Suiza airplane engine in comparison with gasoline.

Used on a passenger car the fuel drove the car 17½ miles to the gallon as against 9 m.p.g. on gasoline, and increased the speed from 47 m.p.h. to 69 m.p.h.

### Tested in Hydroplane

In a hydroplane with the engine at 1600 r.p.m. the plane remained in the air 22 min. longer on 10 gal. of Liberty fuel than on 10 gal. of gasoline.

A Harley-Davidson motorcycle was driven 23,000 miles in severe tests and showed no corrosive action and no carbon. Weighing 593 lb. with its load the motorcycle journeyed 256 miles without adjustments on 4.66 gal. of Liberty fuel, consuming 1½ qt. lubricating oil, averaging 55 m.p.g. The average speed was 22.5 m.p.h. Used with gasoline over the same route and at the same speed the motorcycle averaged 32.18 m.p.g. and consumed 4 qt. of oil.

### Increases Truck Mileage

A Garford 3-ton truck weighing 7373 lb. with its load averaged 10.4 m.p.g. with Liberty fuel over 232 miles, used 2 gal. of water in the radiator and consumed 2¼ qt. of lubricating oil, or 103.1 miles per quart. The journey was made at a speed from 9 to 12 m.p.h., the lower speed during rain. With gasoline the truck averaged 6.37 m.p.g., consuming 45 gal. of gasoline, used 8½ gal. of water in the radiator and 4¼ qt. of lubricating oil at the rate of 63.5 miles per quart of oil. The truck easily traveled the Cumberland district mountains on high speed on Liberty fuel, and failed to do this with gasoline.

In a report of tests of the Liberty fuel by the Bureau of Standards signed by W. S. Stratton, chief of the bureau, on Nov. 21, it was stated that three grades of the fuel were submitted marked "type A," "type B" and "Liberty fuel," the

first two being for passenger car and truck use and the third for airplane consumption.

The class B standardized truck engine and a 150 hp. Hispano-Suiza airplane engine were used by the Bureau of Standards in making tests. The truck tests were at one-half the maximum power and one-quarter the maximum power with readings taken in each run at a fixed load at 200 r.p.m. from 400 r.p.m. to 1200 r.p.m.

Commercial and special "X" gasoline were used in comparison. A Claudel carburetor was a part of the airplane engine. New spark plugs were used with each change of fuel. The airplane was operated under all conditions and with the throttle wide open.

### Operation Completely Satisfactory

Summarizing in the report Dr. Stratton stated that there was no engine operation trouble, that the exhaust was clean, odorless and generally like gasoline, and that the Liberty fuel gave equal power, giving 3 per cent greater pounds consumed per brake horsepower and with consumption 5 per cent less than gasoline.

The summary further stated that the spark plugs showed slightly more carbon with Liberty fuel, and that the Liberty fuel showed 3 per cent greater horsepower when consuming 10 per cent greater weight of fuel per horsepower per hour though with the thermal efficiency of the engine 2 per cent greater as in contrast with special "X" airplane gasoline.

It was also stated that crystallization occurred at 14 deg. Fahr. and that the fuel could not be cooled much below this without danger of stoppage of fuel lines and the carburetor jet.

The differences between the criticisms above and the claims made by Captain Weisgerber were in the main cleared away. The crystallization, for example, it was agreed, could be eliminated by slight change in the quality of the Liberty fuel.

Following are excerpts of tests by the Bureau of Standards:

	Pounds of Fuel of U. S. Gals. at 60° Fahr.	Heat Value B. T. U. U. S. Gal.
Motor fuel type A.....	7.19	126,300
Motor fuel type B.....	7.20	127,900
Liberty fuel.....	7.07	124,800
Commercial G. S. C. 1918	6.33	119,200
Export airplane gasoline	5.93	113,000

Using motor fuel A versus gasoline in the B truck:

	R.P.M.	Beam. Lb.	Consump- B.H.P. tion	
Gasoline	407	127.75	17.4	.131 } with full
"A" fuel	409	134.63	18.4	.128 } load
Gasoline	401	68.00	8.8	.166 } with half
"A" fuel	408	66.25	9.0	.141 } load
Gasoline	400	32.50	4.3	.191 } with quar-
"A" fuel	411	33.00	4.5	.176 } load

## Ryan Out as Head of Aircraft

Secretary Baker Accepts Resignation but Sets No Date  
—No Successor

WASHINGTON, Nov. 22—John D. Ryan, Second Assistant Secretary of War in charge of Aircraft Production and Operation, has tendered his resignation. The resignation was accepted by Secretary of War Newton D. Baker, who has requested Mr. Ryan to set his own time for the relinquishment of his duties, and expresses the hope that Mr. Ryan will continue until demobilization and contract cancellation plans are matured.

John D. Ryan prior to assuming charge of aircraft was at the head of Red Cross work in Washington. He has been the president of the Anaconda Copper Co. and a prominent figure in the copper field since 1907. He was appointed to supervise the Bureau of Aircraft Production following the resignation of Howard E. Coffin as chairman of the Aircraft Production Board, and at a later date following the aircraft report by the Senate Military Affairs Committee, Secretary of War Baker appointed Mr. Ryan as Assistant Secretary of War in charge of all aircraft, including not only production but also operations.

Following is the correspondence between Mr. Ryan and Secretary Baker:

Nov. 21, 1918.

DEAR MR. SECRETARY:

With the signing of the Armistice and the consequent reduction in the program of Aircraft Production, I believe my work here has become relatively unimportant. I have not taken over the actual direction of Military Aeronautics and my connection with it has not made any real change in its operations.

I feel strongly that now the war is over, my duty lies in the line of my former work. Labor and industry of the country must be quickly adjusted from a war to a peace basis, and the copper production is one of the most vital of the country's welfare. I believe I can do much in helping to bring about stable conditions, and that I should take up the work immediately.

I therefore resign as Second Assistant Secretary of War and Director of Air Service, to take effect as soon as convenient to you.

I desire to express to you my sincere gratitude for the opportunity given me to serve in the war. I have had at your hands the greatest assistance and encouragement in all the work I have had to do. I shall always prize the association with you and with the War Department.

Sincerely yours,

(Signed) JOHN D. RYAN.

To the Secretary of War,  
Washington, D. C.

JDR/ISD

Nov. 22, 1918.

MY DEAR MR. RYAN:

I have just received your letter of Nov. 21. Realizing the very great importance of the production and distribution of copper in the re-establishment of our national civilian industry, and your own intimate relation to this great business, I reluctantly acquiesce in your desire to return to it and to terminate your relations as Second Assistant Secretary of War and Director of Air Service.

Your unfailing courtesy has been a source of great personal happiness to me, and your services to the country as Director of Air Service have been conspicuous; the sense of sureness and executive efficiency which your advent contributed to the Air Service made from the first a marked improvement in the entire prospect. The armistice of course has interrupted the constructive development of that great program. It had, however, advanced beyond the experimental stages, and in so new an art as the air service

America's contribution within a year and a half was substantial and would, in a short time, have been determinative.

I shall set your own judgment as to the most appropriate time for the termination of your office, expressing only the hope that you will continue until the plans for contract cancellation and demobilization are sufficiently matured to allow those who are to carry them out to have definite and fixed principles for their guidance.

Cordially yours,  
NEWTON D. BAKER,  
Secretary of War.

Honorable John D. Ryan,  
Second Assistant Secretary of War.

### No New Director to Take Ryan's Place

WASHINGTON, Nov. 23—Following the announcement of the resignation of John D. Ryan it is said by the War Department that a new director will not be elected for the present to take his place. There is no longer a production problem to be handled and the airplane operation will now naturally become a military function probably to remain under Major General William Kenly, who is in charge of the Division of Military Aeronautics. It was stated that pending reorganization of the Army and the War Department on a peace basis, recommendations for which will be laid before Congress next month by Secretary Baker, it is not possible to arrange for the permanent aircraft establishment of the Army.

### Five Training Fatalities

WASHINGTON, Nov. 20—For the week ending Nov. 9 there were five fatalities on the flying fields of the United States resulting from training in aviation. One fatality occurred at Dorr Field, Arcadia, Fla.; one at Ellington, Houston, Tex.; one at Langley, Hampton, Va.; one at Payne, West Point, Miss., and one at Wilbur Wright, Fairfield, Ohio. For each fatality reported a total of 4019 hours of flying, or 231,520 miles of air travel, is shown.

### Continue Washington Naval Airplane Base

WASHINGTON, Nov. 22—The naval air station at Anacostia, D. C., will be made permanent and continued by the Navy as a testing field. Hangars have already been constructed, housing nine hydroplanes, and a personnel of 150 men is maintained.

### Post Office Wants Anti-Freeze

WASHINGTON, Nov. 25—The Post Office Department, Office of the Purchasing Agent, has asked for bids as follows, f.o.b. factory, sealed proposals to be made prior to 2 p. m. Dec. 2:

Non-freezing solutions for use in motor truck radiators.

Quote on quantity sufficient for 25 cars.

Quote on quantity sufficient for 50 cars.

Quote on quantity sufficient for 100 cars.

Quote on quantity sufficient for 200 cars.

It is to be understood that samples are to be submitted, if requested by the department, prior to making the award.

## Minerals in Burma Increase 16½%

Petroleum, Most Important,  
Only One to Decrease —  
25% Increase Over 1915

WASHINGTON, Nov. 22—The Government of Burma, according to the American Consul there, increased its mineral product output in 1917 16½ per cent above that of 1916 and 25 per cent higher than in 1915. The figures for the 3 years are as follows:

Minerals	1915	1916	1917
Petroleum	\$6,033,378	\$5,357,534	\$5,119,535
Tungsten ore	1,383,890	2,349,571	2,975,340
Lead	1,538,550	1,567,214	1,984,227
Silver	151,343	430,935	1,154,757
Tin and tin ore	207,142	316,435	461,339
Building material and road metal	320,036	319,554	347,627
Rubies, sapphires and spinels	176,646	172,557	252,236
Jade	61,695	45,330	140,794
Gold	60,028	37,517	20,672
Zinc ore	847	28,354	.....
Iron ore	20,147	20,869	6,151
Clay for pottery	651	3,163	3,597
Molybdenite	.....	445	3,715
Amber	970	766	3,329
Bismuth	.....	.....	735
Antimony ore	33	2,433	742
Platinum	484	226	93
Copper	11,515	.....	.....

Total.....\$9,967,355 \$10,662,903 \$12,424,529

The figures given in the table are said to represent the actual value of the product at the point of production.

The only mineral product of any consequence which showed a diminution in value of production was petroleum. The increase was most marked in silver, tungsten, tin and lead.

Petroleum is the most important mineral product of Burma, and petroleum production and refining is, next to the production and milling of rice, the most important industry of the Rangoon consular district. The value of the crude petroleum as stated in the above table gives little idea of the importance of this industry, for, of the products of the petroleum refineries—kerosene, gasoline, benzene, lubricating oil, paraffin, candles, etc.—after furnishing most of the needs of Burma, about \$20,000,000 worth a year is exported to foreign countries and to other ports of India.

The principal oil fields of Burma are located in the Irrawaddy valley, about 200 to 400 miles from the sea. The most productive fields—Yenangyaung and Singu (Chauk) in the district of Magwe—are located on the left or eastern bank of the river. The field on the western slope—Yenangyat in Pakokku district, Minbu in Minbu district, and Minhla in Thayetmyo district—have never been so successful. The Kyaukpyu and Akyab fields on the Bay of Bengal are almost negligible. About 150 Americans—oil drillers, bosses and superintendents—are employed in the oil fields of the Irrawaddy valley. The production of petroleum is practically in the hands of Americans, and Yenangyaung, Chauk and Yenangyat are to all purposes American towns.

The production in gallons of each of these fields for the years 1915-1917, respectively, was as follows:

Fields	1915 Gal.	1916 Gal.	1917 Gal.
Yenangyaung	198,809,315	240,194,063	176,979,020
Singu	77,005,880	44,105,013	85,639,166
Yenangyat	4,099,345	5,310,740	6,620,908
Minbu	2,316,207	2,043,542	3,468,382
Minhla	25,920	35,000	30,000
Kyaukpyu	23,220	68,843	46,821
Akyab	12,045	11,882	10,894

Total.....282,291,932 291,769,083 272,795,191

The output for 1917 was 19,000,000 gal. less than that of the record year of 1916, and nearly 10,000,000 gal. less than that of 1915. The decline during the past

Tungsten ore (wolframite) and tin ore are obtained in extreme southeastern Burma, in the narrow strip where the mountains, which separate Burma from Siam, slope down toward the coast of the Bay of Bengal, the Gulf of Martaban, and the valley of the Sittang River above the head of the gulf. This region, of which the district of Tavoy is the center, claims to be the chief wolfram-producing region of the world. What promises to be an important field was recently discovered in the district of Yamethin, on the border of the southern Shan States in the upper valley of the Sittang. The production of wolfram and tin for

the years 1915-1917 was as follows: In the districts of Tavoy, Mergui, southern Shan States and Thaton, wolfram ore, 11,761 tons; in the same districts, with the addition of Amherst, tin ore, 1385 tons, and in Mergui alone, block tin, 382 tons.

#### Olds Price Advance Rescinded

DETROIT, Nov. 25—The Olds Motors Works, Lansing, Mich., has withdrawn the advanced prices announced about Oct. 1 last. At that time the material and war tax situation apparently justified an advance which, now that peace is here, appears unnecessary. Oldsmobile distributors, therefore, have been advised that the scale of prices in force prior to Oct. 1 last will rule. Present production at the Olds plant consists of coupes and sedans, a limitation on production which likely will persist until after the first of the year.

## Views From an Airplane Camera

The arrow shows a "Trou de loup" guarding a farm. The true worth of the airplane camera is made plain by this picture, which plainly distinguishes between the real trenches and the dummies. The eye cannot distinguish the difference, but to the camera the dummy throws no shadow

year was in the Yenangyaung field (the Singu, Yenangyat and Minbu fields showed a marked increase) and was due to the lack of tonnage to move the product and to the difficulty in getting piping and other supplies.

The Government of Burma is doing everything possible to encourage the production of tungsten, and its efforts have been attended with good results. The 1917 output of this metal was nearly 25 per cent greater than that of 1916, which, in turn, was nearly 50 per cent greater than that of 1915. The increased production of tungsten ore and the high price of tin, which is found associated with the tungsten, has led to a similar increase in the output of this metal.

*This view was taken while the British were charging to the German second line trenches, having taken the first line. Unfortunately the altitude of the plane was too great to reveal the troops in detail*

## Intelligent Selection Cuts Turnover

Bureau of Labor Reviews Methods of Plant Where Labor Turnover is But 65%

WASHINGTON, Nov. 23—The October issue of the Monthly Review of the United States Bureau of Labor Statistics contains an article by Dr. Boris Emmet, which shows that a large motor-vehicle manufacturing concern in the Middle West has been remarkably successful in keeping labor turnover down by using intelligent methods in selecting and handling its labor force.

Twenty-two plants in the same locality were studied by the Bureau of Labor Statistics, of which only four had a turnover of less than 100 per cent per annum, while a turnover as high as 500 per cent is not unusual. The turnover in the particular plant referred to above has not exceeded 75 per cent per annum since 1915, and for the year ended April 1, 1918, the turnover was less than 65 per cent.

Doctor Emmet found that the company's labor policy had much to do with keeping down the turnover. This company favors hiring married men past 35 years of age and residents of the city where its plant is located, for there is little to draw them away. There is no objection to union membership. Wages are adjusted in accordance with changes in the cost of living, ascertained by studies and records kept by working-men's families.

Committees of workmen are encouraged to get in touch with the management to discuss or forestall grievances. Good working conditions and good treatment of employees are insisted upon, and no scheme of payment that may appear to drive the workers is introduced.

The management realized quickly after the war broke out that living costs must be met by wage increases if labor turnover were to remain low. Late in 1917 it was announced that future wage adjustments would be based on the cost of living. A study of local prices was made, as a result of which it was found, for example, that in November, 1917, a local family of 5 spent on the average \$41 for food, \$22 for rent, \$10 for heat and light, \$10 for clothes and \$7 for miscellaneous purchases, a total of \$90 a month. The wage rate was set high enough to provide a comfortable margin over this figure, and at present initial wage rates are about \$24 a week for adults on the day force. Length of service means increased pay, and considerably more than half the day men make from \$25 to \$35 weekly.

Committees which meet company representatives to adjust or prevent disputes are elected by popular vote, and their personnel changes monthly, thus giving more employees a chance to serve.

Night workers are less likely to remain away from work than those employed during the day. The probability that this condition may hold good generally appears from the facts that night workers can attend to personal business during the day, that because they are better paid they lose more money in staying away, and that because they are, in general, young men they are less liable to sickness than the day workers.

### Ford Leaves Ford Motor

DETROIT, Nov. 25—Henry Ford is withdrawing from active participation in the Ford Motor Co. to become a newspaper publisher and to give more time to Henry Ford & Son's tractor business. The new publication, which is to be issued once a week, will be printed in Dearborn, Mich. It is to be known as Henry Ford's National Weekly. E. G. Pipp, former editor-in-chief of the Detroit News, is editor.

Utilization of the great Ford selling organization to put the publication on the market nationally is planned by the directors of the weekly. Just how this will be done has not been announced, but it is presumed that every Ford car, truck and tractor dealer will be a circulation agent for the paper. The aim of the publishers is to establish a circulation of one million copies within 6 months, and to assure this the Ford organization will be used. Ford's son Edsall will take his father's place in the Ford Motor Co.

### Automobile Agency Wanted

WASHINGTON, Nov. 25—The Department of Commerce reports an individual in the Netherlands desiring an agency for automobiles, motorcycles and oil motors for vessels. Payment will be made in Dutch currency on arrival of the goods. Correspondence can be made in English. Further information can be secured by asking the Bureau of Foreign and Domestic Commerce with regard to "foreign trade opportunity No. 27713."

### Automobiles and Motorcycles in Australia

MELBOURNE, Oct. 24—The following table gives the number of passenger cars and motorcycles in use in the Commonwealth of Australia. Figures for Western Australia are not available at this time, therefore those for New South Wales, Victoria, South Australia and Tasmania only are given. South Australia totals are as of Sept. 30, 1918; the others are as of June 30.

Census of Motor Vehicles in Australia

	Queensland	New South Wales	Victoria	South Australia	Tasmania	Total
Cars .....	2,404	20,645	14,142	8,512	1,890	47,593
Motorcycles .....	688	8,532	9,530	6,968	1,425	27,133
Totals .....	3,092	29,177	23,672	15,470	3,315	74,726

## To Use Army Trucks for Mail

Post Office Makes First Move  
Toward Their General Adoption—Halve Mail Cost

WASHINGTON, Nov. 25 — The first step toward extensive use of Army trucks for mail service with discharged enlisted men as drivers was taken Saturday by the Post Office Department when it requested the War Department to release 7 trucks and 4 men for a 115-mile star route between Helper and Vernal, Utah.

This route now costs the Government \$78,000 a year, and it is estimated that by the use of Army trucks, and payment of \$4 per day to former soldier chauffeurs, the cost can be cut in half.

The Post Office will request 400 additional trucks and men shortly and increase the numbers as Army demobilization proceeds. It plans an interlacing motor truck system with terminals extending from the Atlantic to the Pacific coasts in the form of a U-shaped route with the three points at Portland, Me.; New Orleans, and Portland, Ore.

At present a Portland, Me., and New Orleans route is in operation with a 12-day schedule between the two cities. Motor truck routes have been operating successfully from the financial standpoint, one of 135 miles earning \$16,000 a month with an upkeep cost of \$800.

### 20,000 Army Trucks Available

It is expected that 20,000 motor trucks will be released by the War Department for this rural mail service.

According to the bill proposed by Congress, Army trucks and airplanes can be and are to be turned over to the postal officials by the War Department as they can be used for postal service, following the war, as they are demanded by the Post Office. It is the plan that the Post Office authorities are operating and subjecting to use thousands of motor trucks. The general plan also includes the establishment of mail service by truck, chiefly at points where there is neither rail nor water facilities for hauling the mail matter, and by means of this it is expected that the territory of the United States which is now not enjoying the benefit of first class mail service will be efficiently linked with rail and water transportation, by means of the motor trucks.

### Will Improve Communication

According to Fourth Assistant Postmaster James Blakslee, the introduction of a huge number of motor trucks into the mail service will consequently tend to complete the mail service throughout the nation, make more efficient the rural district life, especially those now suffering from poor means of communication and transportation, and will further tend to increase the importance of many communities which are now out of proper contact with the railroads and waterways.

## Domestic Manganese Supply Doubled

### U. S. Mines Now Produce One-Third of High-Grade Ore Needed by Nation

WASHINGTON, Nov. 25—Domestic mines now supply one-third of the high-grade manganese ore used in the United States. This is an extraordinary increase over the production of 1917 when the domestic mines supplied only one-sixth of the ore needed. During the first 6 months of 1918 shipments of ore contained more than 35 per cent of manganese, total 136,554 tons, and in October this grade of ore was being shipped at a rate of 28,000 tons monthly, or 336,000 tons a year.

#### Estimated Output 324,000 Tons

It is estimated that the total production of high-grade manganese in this country in 1918 will be 324,000 tons. The extraordinary increase in the output in 1918 has fully offset the loss occasioned by the restriction of imports made necessary by the shortage of ships and has established confidence in the capacity of the domestic deposits to supply a considerable part of domestic need, according to the United States Geological Survey, Department of the Interior, which has just completed investigation of the manganese ore industry in this country.

## Zinc Rolled in the United States, 1915-1917

	1915	1916	1917
Zinc sheets:			
Quantity, pounds.....	77,567,096	73,760,938	90,002,569
Value.....	\$10,952,609	\$13,758,613	\$16,465,052

Rolled zinc exported:			
Quantity, pounds.....	•	25,024,182	33,027,991
Value.....	•	\$4,540,146	\$5,730,792
Average value per pound.....	•	\$0.181	\$0.174
Domestic consumption of rolled zinc, pounds.....	•	70,618,102	84,224,960

\*Figures not available.

Imports of manganese ore by all sources in the first half of 1918 were 244,836 tons. The shipments from abroad came from Brazil, Cuba, India, Chile, Costa Rica and several other countries shipping small quantities. Brazil supplied the greatest amount, shipping in all 171,895 tons. Below is the table showing in detail the domestic shipments of manganese for the first 6 months of 1918:

#### Nash Returns to Kenosha.

WASHINGTON, Nov. 26—Charles W. Nash, who has been chief in charge of production and engineering for the Bureau of Aircraft Production, has returned to Kenosha. With both Ryan and Nash out, this bureau is now without a head.

## U. S. Production of Rolled Zinc

### Both Quantity and Price Have Increased Steadily Since 1915

WASHINGTON, Nov. 26—It is a curious fact that although the Geological Survey Department has for many years collected statistics showing the production of zinc, it has not been possible to publish figures showing the production of rolled zinc. The reason is that the output heretofore has been practically in the hands of two companies and publication would have disclosed individual business.

Since the beginning of the war the increased demand for sheet zinc with which to line packing cases for shipment overseas has been so great as to afford inducement to many other companies to engage in the zinc-rolling business and, it is possible to give figures.

#### Modify Truck Order Cancellations

WASHINGTON, Nov. 26—Owing to the fact that some of the manufacturers of commercial trucks who received orders from the Government prior to the signing of the armistice had more fabricated materials on hand than others, the wholesale cancellation of 50 per cent of all commercial truck orders which was announced last week has been slightly modified and readjusted.

In those plants where there was little or no fabricated material found, the cancellations were increased above 50 per cent, while in those where the Government found a larger amount of materials which meant greater waste of materials with the 50 per cent cancellation, the cancellations were readjusted.

The amounts of regulations or increase of the cancellations was not made public by the Government. An official stated, however, that the changes were not due to demands from General Pershing, and were not important changes numerically. They were merely the readjustment that is being made by each department which following cancellations investigates the materials on hand and then readjusts the contracts.

MANGANESE AND MANGANIFEROUS ORE (GROSS TONS) SHIPPED, JANUARY 1 TO JUNE 30, 1918, AND UNITED STATES GEOLOGICAL SURVEY'S ESTIMATE OF SHIPMENTS DURING THE YEAR 1918

\*Fluxing ore not included or not reported.

†Shippers of residuum and quantity of residuum shipped not reported.

‡The part of the ore from Arizona and Nevada that was used for fluxing is not included in total for United States.

§Ore from Wisconsin, containing approximately 5 per cent manganese, not included in total.

## Export Regulations Modified

### Import Rules, Too, Altered Following Signing of Armistice—Bars Let Down

WASHINGTON, Nov. 22—The signing of the armistice has allowed the War Trade Board to modify some of its regulations governing the exportation and importation of commodities, the changes including an additional import of rubber of 7500 tons up to Jan. 1, 1919, and the export of Sea Island and Egyptian cotton. Any hides and skins, not including fur skins, can also be imported hereafter provided that such skins were all contracted for by the American importer prior to Jan. 15, 1918.

The War Trade Board will, it announced, also grant export licenses more freely than heretofore on various commodities. It will not specify the number of licenses nor the commodities, but asks the exporters and importers to make their requests and state explicitly if the licenses are required for business which is actually in need, together with the dates of the orders.

The strictest regulations on exports will be confined hereafter to Europe and Siberia, which will require regulations inductive to the rehabilitation of those sections of the globe. Restrictions will also be placed to some extent on the exportation of bulky commodities by reason of the scarcity of tonnage.

The return of troops, carriage of supplies for troops not yet returned, and carriage of commodities necessary for the relief and construction abroad oblige the War Trade Board to continue its supervision and limit the increase in tonnage engaged in non-regulated trade.

The War Trade Board also calls the attention of exporters to the fact that the Trading with the Enemy Act still remains in force and effect.

#### All Building Construction Permitted

WASHINGTON, Nov. 22—All remaining restrictions on non-war construction throughout the United States were officially removed to-day by the War Industries Board. This permits all building operations of whatever character to proceed. No further permits will be required from the War Industries Board or the State councils.

#### Exports of Oil from Tampico

WASHINGTON, Nov. 23—Declared exports of crude oil and petroleum products from the Tampico district, Mexico, to the United States in September, 1918, amounted to 4,038,167 bbl., according to a report by Vice-Consul D. A. Willson. The movement from Tampico was 2,785,935 bbl.; from Tuxpam, 842,774 bbl., and from the new loading station at Port Lobos, 409,458 bbl.

Shipments to points other than the United States during the same period

were reported as 1,047,554 bbl.; the movement from Tampico was 540,807 bbl.; from Tuxpam, 442,212 bbl., and 64,535 bbl. from Port Lobos. The gross shipments, therefore, reached a total of 5,085,721 bbl., or a greater amount than ever shipped from this consular district. The above shipments included refined products as follows:

Products	From Tampico Barrels	From Tuxpam Barrels
Reduced, crude .....	732,500	.....
Distillate .....	187,000	18,515
Topped crude .....	138,000	18,080
Gasoline .....	179	.....
Naphtha .....	121,000	.....

The destination of oil shipments during the month was as follows:

Destination	From Tampico Barrels	From Tuxpam Barrels	From Port Lobos Barrels
United States .....	2,785,935	842,774	409,458
Dominican Republic .....	10,128	.....	.....
Chile .....	213,329	100,310	64,535
Cuba .....	38,864	.....	.....
Canada .....	.....	26,326	.....
England .....	246,466	.....	.....
Guatemala .....	32,020	.....	.....
Mexico .....	.....	315,076	.....
Total .....	3,326,742	1,284,986	473,993

#### Increase Rubber Import Permits

WASHINGTON, Nov. 22—The import restrictions on rubber have been modified so that the total imports of 25,000 tons which was to be permitted during the last three months of 1918 has been increased to permit the licensing of an additional 7500 tons prior to Jan. 1, 1919. The 32,400 tons will be allocated by the War Trade Board.

#### Fulton Cuts Price \$150

FARMINGDALE, L. I., Nov. 25—The Fulton Motor Truck Co. has reduced the price of its standard chassis by \$150. The old price was \$2,000 and the new price is \$1,850.

#### Airplane Contracts Canceled

WASHINGTON, Nov. 22—Two hundred and twenty-five million dollars worth of orders for airplanes, engines, parts and instruments have been canceled by the Bureau of Aircraft Production, according to a statement by Secretary of War Newton D. Baker. These orders were largely those on which production had not yet started.

#### Start Navy Air Mail Service

WASHINGTON, Nov. 25—An aerial mail service between the Aero Station at Anacostia, D. C., and Norfolk, Va., naval base will be inaugurated shortly by the Navy Department. It will carry official mail only and will in no way conflict with the postal air service.

#### Cancel South Carolina Hangar Project

WASHINGTON, Nov. 22—The War Department has canceled the contract for the construction of a steel hangar at North Camp Jackson, South Carolina.

## Cut All Production Restrictions

### No Official Word from W. I. B. But N. A. C. C. Assumes Such Will Be True Jan. 1

WASHINGTON, Nov. 25—It seems probable that definite word removing all restrictions on the manufacture of passenger cars and trucks will be forthcoming in the very near future. The National Automobile Chamber of Commerce already has come to this conclusion and has announced in a circular to its members that "after Jan. 1 there will be no limitation of any kind on the manufacture of passenger cars or trucks."

Actually no word of authority has come from the War Industries Board. Charles C. Hanch, chairman of the Automotive Products Section of this board, has officially told manufacturers that their pledges to the board will be canceled after Jan. 1. In view of this fact, and after consultation with Hanch and other members of the Priorities Board, the N. A. C. C. has come to the conclusion that all restrictions are to be lifted Jan. 1.

Rhodes Baker, of the Priorities Board, who has been the official point of contact between this board and the manufacturers, has resigned and left the national capital.

#### Siam's Output of Tin and Tungsten

WASHINGTON, Nov. 22—According to an official estimate received from the Vice-Consul at Siam, the output of metallic tin in 1917 was 9466 short tons as compared with 10,078 short tons in 1916. Tungsten ore recovered in 1917 amounted to 800 short tons as against 584 short tons in the previous year.

The Siamese Government collects a royalty on tin and tin ore amounting to 25 per cent of the market price in Singapore, the fluctuation in value at the latter place being adjusted and the rate reckoned according to a "royalty scale" published in the Siamese Government Gazette from time to time. A recent issue of this Gazette notified an extension of the "royalty curve" to meet the increased price of tin. According to telegraphic advice from Singapore the price of tin on Aug. 29 was \$162 per picul, which is approximately 7 per cent of a ton, and at that figure 50 tons had been sold.

A recent order in the Government Gazette announced that the royalty on tungsten ore, which was previously collected at the same rates as in force on tin ore, had been reduced to 10 per cent ad valorem.

#### New Joints for Templar

CLEVELAND, Nov. 25—The Templar Motors Corp. has adopted Thermoid universal joints for use in its latest model.

# Gasoline Production Drops Slightly

Nine Months' Totals Are Satisfactory—Stocks Show a Decrease

## PRODUCTION

	September, 1918	August, 1918
Crude oil (bbl.)	28,390,431	28,534,275
Gasoline (gal.)	314,595,959	330,335,046
(Stocks on Hand—Sept. 30, 1918; Aug. 31, 1918)		
Crude oil (bbl.)	14,462,100	13,946,595
Oils purchased to be re-run (bbl.)	1,312,275	1,082,892
Gasoline (gal.)	269,772,723	285,446,538
Kerosene (gal.)	436,628,907	424,281,481
Gas and fuel (gal.)	583,407,769	569,016,413
Lube. (gal.)	147,425,556	137,496,986
Wax (lb.)	181,044,508	176,197,680
Coke (ton)	16,866	19,912
Asphaltum (ton)	79,424	88,446
Miscellaneous (gal.)	444,353,139	459,891,496

NEW YORK, Nov. 25—Production of both crude oil and gasoline dropped slightly during September as compared with August, but the total production for the first nine months of 1918 is well ahead of that for a similar period in 1917. Stocks of both gasoline and crude have again decreased slightly.

During September the daily average production of gasoline was 10,486,532 gal., as against 10,655,969 gal. in August. When considering these average figures it should be remembered that September has one day less than August.

Stocks of gasoline on hand as of Sept. 30 are 60,562,323 gal. less than the quantity on hand Aug. 31. During September the production of crude oil dropped 143,844 bbl., and stocks of crude increased 515,505 bbl.

Taking to nine months' totals it will be found that the production of both crude and gasoline have increased by 6,355,687 bbl. and 586,428,698 gal. respectively. The stock of kerosene shows

a slight decrease, but, on the other hand, that of fuel oil shows an appreciable gain.

## Eliminate Gasoline Tax

WASHINGTON, Nov. 25—The Senate Finance Committee, which is revising the new War Revenue Bill, has cut out of it the proposed tax of 2 cents a gallon on gasoline.

## Bituminous Storage Limit Off

WASHINGTON, Nov. 25—All storage restrictions on bituminous coal have been removed by the United States Fuel Administration in conformity to the action of the War Industries Board in canceling its preferential industries list. Anthracite coal is not affected, however, by the ruling of the Fuel Administration.

Every industry in the country now may store as much bituminous coal as desired or obtainable, as the action of the War Industries Board removes the necessity for the Fuel Administration to distinguish longer among different classes of industrial plants.

## Boston Dealers After Business

BOSTON, Nov. 23—The armistice and proposed peace has rejuvenated dealers in this city. Now they are planning to go after business again. And in order to get facts at first hand they have journeyed to the factories to learn things. On one train from Boston last week there were enough dealers to nearly fill an entire Pullman sleeper. They were heading for Cleveland, Detroit and Toledo.

## Portland Cement Association's Dinner

CHICAGO, Nov. 20—The annual dinner of the Portland Cement Association will be held at the Biltmore, New York, on Wednesday, Dec. 11.

# New Samson Tractor at \$650

General Motors Develops 2-plow Machine to Compete With Fordson—Out Soon

NEW YORK, Nov. 25—The General Motors Corp. is shortly to enter the market with a new small farm tractor in a price field to compete with the Ford. This will be known as the Model M Samson and will sell for \$650. It is to be a 2-3-plow machine designed to pull two 14-in. plows under all conditions and three plows under favorable conditions.

It is understood that this model is to be in addition to the present Samson model, which is somewhat larger and sells for in the neighborhood of \$1,750. The new machine is to be built in the Janesville, Wis., plant which the company recently acquired and which is now actively being placed in condition for production. It is stated that the machine will be sold by the tractor selling division of the General Motors Corp.

## Investigate Labor Conditions

WASHINGTON, Nov. 22—The United States Employment Service is making an analysis of the labor conditions in industrial centers throughout the country in co-operation with the War Department and the War Industries Board. Approximately 100 industrial centers and 100 industries will be covered by the investigation. The inquiry will be conducted by the community labor boards of the service, which will secure their information by means of personal contact and telephone communication with employers, plant managers, employment managers, labor organizations, commercial bodies, the local employment offices of the service and other sources.

## Suggests War Automotive Exhibition

Such An Event, Arranged on an Elaborate Scale, Would Bring Home the Importance of Cars, Trucks, Tractors and Airplanes in Winning the War

By W. F. Bradley\*

PARIS, Nov. 1—Special Correspondence—Several million Americans deeply interested in all that pertains to the automobile will hail the end of the war without having had an opportunity of fully appreciating the work that gasoline has done toward securing a victorious peace. The story of the automobile in the war never has been fully told.

The probabilities are that it never will receive justice in written word. In European war circles there always has been a fear of giving too much credit to the automobile services of the Army. When I wrote the story of how automobiles held at bay the Crown Prince's forces at Verdun, the French military censor objected to the opening sentence, "Automobiles saved Verdun." He did not question the accuracy of the assertion, but he was afraid of slighting the infantry and artillery services.

Yet it is on official record that automobiles were the decisive factor in three great battles. Also, now that Austria has ceased to be an enemy, it can be stated that the only reason the Italians did not follow up the first victory on the Piave River was owing to lack of adequate automobile transportation. Had there been a big reserve of trucks, the Caporetto disaster could have been relieved immediately.

### Huge Automotive Demonstration

The American automobile industry should organize on an elaborate scale, and as soon after the declaration of peace as practicable, a huge demonstration of the automobile at the war. By the term "automobile" is meant everything which employs gasoline as its motive power. This naturally brings in the airplane.

No lifeless, inanimate exhibition will satisfy full-blooded Americans who have had the unappreciated good fortune to follow the war across three thousand miles of sea water. What is required, and what is proposed, is a practical open-air exhibition, as closely approaching natural conditions as possible, of what the automobile has done to help win the war. This is a big program; it is an elaborate job. But the American automobile industry can handle it, and should handle it.

In this exhibition we want to see the various Allied and enemy airplanes which have been in service on the front. For instance, what American would not travel halfway across the continent to see Eddie Rickenbacher's Spad scout plane, at this moment riddled with more than forty bullets, in actual combat with a real German plane piloted by somebody

who had consented, for the time being, to play the role of the Boche?

How many Americans have seen a chasse squadron in battle formation? How many have seen a bombing group take the air with chasse planes as a protecting escort? How many have seen anti-aircraft guns in action against a number of planes high up in a clear sky, and have watched the efforts of the pilots to escape that deadly fire? How many have seen an airplane attack a captive balloon, fly low over trenches with machine guns going, or "pancake" down with a dead motor on shell torn ground? All this should be a part of the program of the automobile exhibition.

### Would Show Everything

Readers of war news picture airplanes operating from a prepared ground and flying away to a new place whenever it becomes necessary to change location. It is not generally realized that with every squadron of 18 airplanes there are in direct attendance from 16 to 18 trucks or touring cars and nearly as many trailers, without which the planes could not remain in the field for a single day. The airplane, the most mobile of all units, is the one most dependent on automobile transportation. The airplane trucks and trailers should be shown in actual operation just as they performed in the Argonne, the Somme and the Marne.

It should be shown how an observation balloon squadron works. The "sausages" should be sent up from the mobile automobile winches, brought down hurriedly when an enemy attack is pending, covered and camouflaged to hide them from spying eyes, and shown packed up ready for transportation. There should be telephone cars in communication with the men up aloft, and motorcycle dispatch riders ready to carry urgent messages to commanding officers.

The work of the automobile in connection with artillery is itself sufficient to form an exhibition of more than ordinary interest. There should be shown the French four-wheel drive tractors, the Italian mountain tractors, the special British machines and the American self-track layers specially designed for hauling guns.

Machines and men who have had actual service on the front should show how guns are brought into position, dropped into gullies, hauled up hill sides, supplied with shells, all without the use of horses. The special gun carriages, designed on automobiles lines, and made to be towed by automobiles, should be given a prominent place. There is need, too, for automobile trucks—many of which never even have been described—

which carry guns on and fire from their own platform.

Tanks and armored cars constitute the most spectacular feature of any exhibition. Not only should all of them be shown, but they should operate as nearly as possible under conditions approaching actual warfare. Army searchlights are nearly all of the automobile type. Here there is a wonderful opportunity for a spectacular display comprising night flying and infantry attacks with the use of searchlights.

A war automobile exhibition could best be combined with a series of track races, for the war has had a most direct influence on speed. Indianapolis, for instance, is well placed for staging such a show. The world's short-distance speed record officially belongs to Germany for, although Arthur Duray and his 300-hp. Italian Fiat put up much faster time, official recognition was never given this performance.

In a conversation the other day one of the Fiat engineers stated, "As soon as the war is over we can put a 400-hp. aviation motor in a chassis weighing less than 2000 lb., and I believe we can establish a record of 3 miles a minute." A few days later the engineer of a French firm indicated his intention of trying to put up the same record in a similar manner. There are three European firms with a program and racing cars ready for after the war, and there are a dozen others ready to make a start. There will be no lack of racing interest.

It will take time, money and hard work to organize a creditable war automobile exhibition. But the job is worth while.

### More Post Office Trucks

NEW YORK, Nov. 26—The motor truck service of the New York Post office Department is soon to be very considerably expanded. At the present time, there are less than 100 trucks in service, and this is to be increased to 270. It is proposed to put in service in the very near future, the following vehicles:

10—1½-ton	White
90—1½-ton	Packard
99—¾-ton	White
43—3-ton	White
28	Ford

### 5000th Packard-Liberty Shipped

DETROIT, Nov. 26—The Packard Motor Car Co. shipped its 5000th Liberty engine on Nov. 21, practically one year after the first engine of this kind to be produced by the company. It was on Thanksgiving Day, 1917, that actual production was started. Production on the original order for 6,000 will be completed in less than 30 days at the present rate of output.

### Peterson Joins Koehler

NEWARK, N. J., Nov. 26—Carl D. Peterson has become affiliated with the H. J. Koehler Motors Corp. in the capacity of engineer. He will have charge of the design and production of the new 3½- and 5-ton trucks and 7- and 10-ton road tractors which the company is shortly to place on the market.

Seconds 10 per cent less than the invoice Pittsburgh price for corresponding primes.		

During September last our Allies' share of exported petroleum products was 72 per cent of the total. The share of England and France was valued at nearly \$7,000,000

Renewed attention is being given in England to the subject of the use of alcohol as motor fuel. A committee to investigate the available sources of supply of industrial alcohol, with particular reference to its manufacture from materials other than those which can be used for food purposes, has recently been appointed by Walter Long. The committee is to investigate the method and cost of such manufacture, and the manner in which alcohol should be used for power purposes. Sir Boverton Redwood, Bart., is chairman of the committee.

The London Commissioner of Police has issued a license to the London General Omnibus Co., for 20 motor omnibuses to be operated on compressed coal gas. The omnibuses will be run under the supervision of the Gas Traction Committee.

## An Example of South American Body Building

A cabriolet body built on a Cadillac chassis by Fehling Bros., Buenos Aires. This firm found it necessary to develop body building on account of difficulty and delay in obtaining bodies from the United States

# New York State Investigates Its Tractors

Department of Agriculture Finds They Increase Crop Yields  
But Do Not Materially Decrease Cost of Farm Operations  
—Reports from 250 Farmers Classified

WASHINGTON, Nov. 23—"Judging by the experience of tractor users, it is not safe to expect any material reduction in the cost of farm operations per acre through the use of the tractor, but it is safe to expect to be able to increase the crop acreage to a very considerable extent and at the same time the amount of crops which one man can raise."

This is the summary of tractor experience in New York State given in a bulletin issued by the United States Department of Agriculture following investigations. Tractors using gasoline or kerosene, says the bulletin, are increasing in numbers on Eastern farms. More than 250 New York State farmers provided the detailed reports of their experiences with tractors during 1917 and the spring of 1918 as the basis for the bulletin, which points out both the advantages and disadvantages of the tractor, the farm conditions, economy of the tractor, and shows that not every farmer will find the tractor profitable.

## Farms Are Diversified

The surface of New York State, according to the bulletin, is rolling. The soil is a comparatively heavy loam with heavy clay sub-soil and large and small stones numerous. Some of the larger stones can cause a breakage of the plow or hitch. The farms are diversified, many of them growing at least half a dozen different field crops. Most of the farms it was found grow hay, oats, wheat, corn, barley and beans, with the largest acreage devoted to the first named and decreasing respectively. A small percentage of tractors were found used on farms where more than 40 per cent of the crop acreage was devoted to fruit.

Tractor owners were asked to state the advantages and disadvantages of tractors and the replies show that tractors:

**Work more rapidly**—More than 50 per cent of the owners pointed out that the tractor performs its work more quickly than horses and that even the 2-plow tractor results in a considerable increase in the plowing rate.

**Saves man labor.**

**Does better work**—More than 50 per cent of the farmers replied placing the ability to do better work third in the list of advantages, mentioning also that the best work was evident, and emphasized under hot weather conditions.

**Inability to use the tractor satisfactorily until top soil is well dried out was the first disadvantage named.**

**Packs moist soil**—It was found that on the comparatively heavy soil packing was injurious in those spots and there was likelihood of the tractor miring in such places.

**Efficient operators**—The difficulty of

securing efficient tractor operators was named.

**Breakdowns**—This was mentioned but is often due to inefficient operation.

**Unsatisfactory on rough land.**

**Unsuitable for small fields.**

Lack of power was mentioned by a few, but it is said this is usually the result of error in choosing a machine too small for the work required of it.

Discussing the size of the farm and the tractor the bulletin points out that a farm business must be of sufficient size to justify the tractor. Eighty-four per cent of the tractor owners reported that the tractors have proved profitable investments. Of these more than one-third increase their acreage with tractors. On the other hand, of the men who found the tractors unprofitable only one-tenth increased their acreage.

The comparatively high percentage of tractor owners who have enlarged their farms, says the bulletin, is significant, for although farms have increased in recent years due to improved farm equipment the increase is not so pronounced on farms where tractors are not used.

## Tractor Selection Important

A suitable size should be selected for a given acreage, says the bulletin. In New York State the number of 3-plow machines sold in 1916 was less than one-third of the total of 2-plow outfits. In 1917 the 3-plow machines increased and amounted to two-thirds the number of 2-plow rigs, which proves that the 2-plow tractor is showing itself too small. Out of 237 farmers 118 reported 3-plow outfits were more suitable and only 110 recommended the 2-plow size. Nine stated that 4-plow tractors were the best. More than two-thirds of the entire number reporting originally bought 2-plow outfits.

The 2-plow machine is recommended by a majority of farm owners of 150 or fewer crop acres, but a considerable percentage of these also recommend the 2-plow machines which, says the bulletin, leads to the conclusion that in general 2-plow tractors do not sufficiently increase the amount of work one man can do, and do not ordinarily develop enough power for operating separators, etc. The 3-plow tractor was distinctly the favorite among farmers operating 150 or more crop acres.

Considering the cost of tractors, the bulletin points out, the price the farmer can pay depends on the amount and value of the work which the machine will perform annually, the value of horses displaced, value of man labor saved and the amount of increased returns which can reasonably be expected from its use. Prices paid in New York State in 1917 averaged \$775 for the 2-plow and \$1,050 for the 3-plow machines, while plow

prices averaged \$120 and \$145 respectively.

The average length of life expected from tractors was reported by the farmers at 9 years, those whose machines had proved profitable estimating 9½ years, while those which had unprofitable investments gave an average of 5½ years.

Farm tractors in New York are used on a daily average of 54 days annually, including both home and custom work. On farms of 100 acres or less (average 81) average days used on the home farm totaled 33, while on farms of 151 to 250 crop acres (average 193) the outfits were used on the home farm 47 days. The tractors owned by the smaller farms were used considerably more, it was found, for custom work than the larger farm outfits. While these figures appear low, says the bulletin, it must be remembered that on farms where horses do all the work they only average 100 days annually, and where both horses and tractors are used the machine need not be expected to have employment for as many days annually, and even if the machine were to do all the work formerly done by horses it would not be employed 100 days per year because it works more rapidly than horses.

Repairs are needed according to the efficiency of the operator and the care he gives the outfit when in use or idle, the conditions under which the outfit is used, the load it is required to pull and the quality of the machine itself. Many tractors are kept in repair by the makers during the first year and the owners therefore do not bear the full expenses until the second year.

## Cost of Repairs

Of 86 tractor owners in New York who have used their outfits one season or less (average 9 months) 31 reported nothing spent for repairs. The others have repair bills varying from a few cents to \$100, the average being \$17, making the average repairs for the entire group about \$11.

Comparatively few machines go through their second season without repair charges. The average repairs for 102 outfits averaging 18 months old was \$34. For 30 machines averaging 30 months the average repairs amounted to \$101. These machines were almost exclusively 2 and 3-plow outfits. The 3-plow outfits were the more costly, but the larger machines also average more days' use annually since they were on larger farms.

The figures given indicate annual repair charges during the first 3 years of about 4 per cent of the first cost, but this, says the bulletin, would undoubtedly increase in the latter years of its life.

According to the figures used by the tractor owners 2-plow outfits plowed 4½ acres per day (10 net working hours) and the 3-plow machines plowed 6½ acres. Replies also showed that large gang plows will not cover as many acres per day as smaller ones when used under unfavorable plowing conditions.

Only 7 per cent of the tractor owners

in New York State reported doing hauling with their outfits—the small percentage being due to the restrictions against the use of tractors on New York highways.

The cost of operating a tractor, it is pointed out, is made up of operating expenses, including fuel oil and grease, repairs, depreciation and cost of man labor. In addition there are less important charges, such as interest on the investment and housing.

The New York farmers reported an average cost per acre plowed for gasoline, oil and grease of 99½ cents where gasoline is used and 49 cents where kerosene is used, with an allowance of 2 cents per acre for gasoline used in warming up.

About 3¼ gallons of either gasoline or kerosene were consumed per acre in plowing for all tractors reported. Less difficulty was also reported by owners of kerosene tractors as compared with a few years ago. Seventy-five per cent of the tractor owners reported that they were operating on kerosene.

#### One Quart Oil Per Acre

The average quantity of oil per acre used in plowing was nearly one quart which, with oil at 40 cents per gallon, amounted to 10 cents per acre. Some reported using a gallon of lubricating oil per acre and others less than one quart per acre with the 3-plow machines slightly more economical than the 2-plow. Grease cost amounted to 2 cents per acre.

The average annual repair charges for the 2 and 3-plow outfits was 57½ cents and 78 cents per day respectively, making the repair charge per acre 12¼ and 12½ cents respectively.

The average annual depreciation on the 2 and 3-plow outfits amounted to \$91.18 and \$123.54 respectively. The depreciation cost per acre was 37½ cents for the 2-plow and 36¼ cents for the 3-plow.

Eighteen per cent of the tractor owners reported hired operators. Some entrusted their machines to ordinary hired hands at low wages and others secured first class operators at fairly high wages. The cost per acre for man labor with 2 and 3-plow outfits averaged 67 cents and 48 cents respectively, showing that the higher the wages paid the greater were the advantages derived from the larger tractors.

Estimating interest at 6 per cent on the average investment the average interest charged per day for the 2 and 3-plow outfits amounted to 43 and 58¼ cents respectively, or the average charged per acre amounted to 9¼ and 4¼ cents respectively. The number of days a tractor is used annually, the bulletin reminds, the less the interest charge is per unit of work.

The approximate total cost for plowing an acre with a tractor under normal conditions is shown to be as follows:

#### Tractor Beats Horses

In discussing economy of the tractor 185 of the 217 owners, or 85 per cent, reported a saving in the amount of hired help. Fifty-seven reported of saving

Approximate cost of plowing an acre with 2 and 3-plow tractors, based on average cost of \$775 and \$1,050 respectively, and a life of 8½ years of 54 working days per year:

Size of tractor	Gasoline	Kerosene	Oil	Grease	Repairs	Depreciation	Man Labor	Interest
Two-plow .....	\$0.87½	\$0.37	\$0.10	\$0.02	\$0.12½	\$0.37½	\$0.67	\$0.09½
Three-plow .....	0.87½	0.37	0.10	0.02	0.12½	0.36½	0.48	0.09½

wages of \$213 annually, the equivalent of one man for 71 days at \$3 per day. Other savings which were overlooked in the reports were the use of the power for threshing, silo filling, shredding, etc.

More than 50 per cent of the tractor owners reported the quality of the work done by the tractor as better than that done by horses, while only 6 per cent said it was poorer. The quality of the work done, the bulletin points out, depends more on the plow and its adjustment than on the tractor. The average depth of plowing done by tractors in New York was over 7½ in., while the average depth previously plowed by horses was slightly less than 6½ in.

Many owners reported difficulty in securing capable tractor operators. Although no figures were made available the answers showed definitely that it paid to secure first class operators at higher wages.

Forty-eight per cent of the 217 owners reported that their outfits were not disabled a single day when needed during the past season, and of the remaining 52 per cent the average number of days their tractors were out of commission when needed was 6¼, not including four men, who stated that their machines were out of commission a large part of the time. About 82 per cent of the tractors were operated by the owner or some member of his family, best results usually being obtained by this class of operators. Twenty-eight per cent reported no time lost in the field on account of trouble and the average time lost per day by the 72 per cent reporting trouble was a little less than one hour.

That tractors do not entirely displace horses was shown by the fact that in two-thirds of the cases the tractor was used only on the same number of acres as was previously farmed, in these instances displacing horses on an average of about two and one-half.

Many tractor owners used their outfits for custom work, 42 per cent reporting custom work with the average number of days used annually for this purpose amounting to 24.

In summarizing, the bulletin states that the replies from the farmers do not indicate a considerable effect on the crop yields as a result of the use of tractors in the place of horses. It points out that it is obviously impossible to obtain maximum results with a tractor when it is used with implements designed for use with horses and that the plows used with it must be especially designed for the purpose.

#### Texas Has 4144 Tractors

FORT WORTH, Nov. 25—Although the lands of Texas, particularly the level prairie country of the western portion of the State, are specially adapted to the

most economic and satisfactory use of the farm tractor in plowing and other farm work there are at this time only 4144 of these machines in use upon Texas farms, according to statistics just compiled by the Chamber of Commerce of Fort Worth. These figures show that there is an average of one tractor to every 30,000 acres of farm land and one tractor to every 102 farms. Sixty-seven Texas counties are without a single tractor and 100 counties have less than 10 each, while only 27 counties in the State have 50 or more tractors.

It is reliably estimated that Texas has only 5 per cent of the necessary number of farm tractors, and it is generally conceded that there is an immediate demand in this State for 50,000 of these machines. To purchase this number will require a minimum investment of \$50,000,000.

#### Buyers Holding Off

BOSTON, Nov. 23—Sales in Boston showed a tendency to slump a bit following the declaration that the ban would be lifted on the production of motor cars. A number of the dealers report that prospective buyers are holding off because they look for a drop in prices in the spring or before that time. Even some of the sub-dealers are refusing now to take cars from distributors because they want to be protected against a drop in price, and this assurance the dealers cannot give. The fact that Cadillac has announced a \$300 cut, and another is expected to make a similar announcement about Dec. 1, has led buyers and some dealers to expect this reduction will be general. Until a few of the other big dealers come out and state that present prices will hold good for some time there will be a fluctuation in sales, caused by the uncertainty.

#### Oil Exports from Mexico

NEW YORK, Nov. 25—Exports of crude oil from Tampico, Mexico, to the United States during September amounted to 4,038,167 bbl. Of this quantity 2,785,935 bbl. were from Tampico itself, 842,744 bbl. were from Tuxpam and 409,458 bbl. from the new loading station at Port Lobos.

#### Overseas Gasoline Demand Increases

WASHINGTON, Nov. 25—The overseas demand for the motor transport grade of gasoline has increased rather than diminished since the signing of the armistice, the Fuel Administration announced yesterday. This fact, as well as domestic requirements, will have a considerable bearing, the announcement said, on any decision whether it is desirable to fix a standard of quality for domestic motor gasoline, which now is under consideration.

### Allison Leaves Chicago Packard

CHICAGO, Nov. 23—H. M. Allison, who has been in charge of Packard distribution in this territory twelve years, has resigned as president and general manager of the Packard Motor Car Co. of Chicago. Mr. Allison has been identified with Packard here and in Detroit for nearly fifteen years. For two years he was president of the Chicago Automobile Trade Association. Much of the credit for the establishment of the National Used Car Market Report by Chicago dealers is given to him. A member of the Packard executive staff at Detroit is expected to succeed Mr. Allison. No information as to Mr. Allison's own future plans is available just now.

### W. C. Potter Resigns

WASHINGTON, Nov. 23—William C. Potter, Chief Assistant Director of Air Service under John D. Ryan, has resigned his position. Mr. Potter served as chief of the equipment division of the Signal Corps when that department controlled airplanes. With the reorganization he entered as the assistant to Mr. Ryan. Mr. Potter was associated with the Guggenheim mining interest as general manager of the American Smelting & Refining Co. prior to his connection with the Signal Corps, and will return to that work.

I. H. Mills, who has been associated with the Westinghouse Electric & Mfg. Co., East Pittsburgh, for the past 23 years, has resigned to become superintendent of the Sperry Gyroscope Co., Brooklyn, N. Y. Mr. Mills began his career with the Westinghouse as a machine operator, and finally became superintendent of the small industrial motor department.

Frank A. Sharpe has been made district manager for the Thermoid Rubber Co., Trenton, N. J., with offices located in the Kresge Building, Detroit.

Capt. Charles E. Speaks has been promoted Major in the Quartermaster Department. He is at present in France.

### Saloniki Good Distributing Center

WASHINGTON, Nov. 25—Although Saloniki, Greece, has suffered considerably from the war and also from a huge fire in 1917 and trade conditions temporarily are unfavorable, the American Consul General there reports that its future as a distributing center is a positive one, and manufacturers will find it worth consideration as a distributing point for trade with Serbia, Bulgaria and Rumania. It is now proposed to have a free customs zone at those ports which will further increase its distributing value. The Standard Oil Co. has a huge floating pipe line system at Saloniki and carries great stocks of petroleum and petroleum products at this point.

## Men of the Industry

*Changes in Personnel and  
Position*

### McLaughlin a G.-M. Director

TORONTO, Nov. 25—R. S. McLaughlin, of Oshawa, Ont., president of the McLaughlin Motor Car Co., Limited, has been elected a director and member of the executive committee of the General Motors Corp.

### Adams Heads Peterson-Culp

DENVER, Nov. 26—J. P. Adams was re-elected president of the Peterson-Culp Gearless Steam Auto Co. at the annual meeting of the company recently. L. Leitner, formerly consulting engineer, was elected secretary and treasurer. The company proposes to build a factory in Denver and to produce both passenger cars and trucks.

### Highways War Service Committee

WASHINGTON, Nov. 26—The Highway Industries Association has formed a War Service and Reconstruction Committee of the Highway Industries with the co-operation of the Chamber of Commerce of the United States.

This new War Service and Reconstruction Committee will take part in the general conference of War Service and Reconstruction Committees of American Industry, to be held at Atlantic City, N. J., beginning Dec. 3, under the auspices of the National Chamber, the week preceding the great highway convention in Chicago.

Representing the Highway Industries Association: W. T. White, Cleveland; A. N. Johnson, Chicago; W. P. Blair, Cleveland; A. P. Sandles, Columbus; A. R. Hirst, Madison, Wis.; E. J. Mehren, New York; S. T. Henry, Washington; H. G. Shirley, Washington.

Representing the American Association of State Highway Officials: Lieut.-Col. W. D. Uhler, Washington; G. P. Coleman, Richmond; W. G. Thompson, Trenton; J. N. Mackall, Baltimore; C. F. Stern, Sacramento; P. D. Sargent, Augusta; W. S. Keller, Birmingham; Ira L. Browning, Salt Lake City; E. A. Duffey, Albany; Max L. Cunningham, Oklahoma City.

Representing the American Automobile Association: David Jameson, president, New Castle, Pa.; A. E. Batchelder, executive chairman, Washington; Carl J. Fisher, chairman Touring Board, Indianapolis; Geo. C. Deihl, chairman Good Roads Board, Buffalo; Eugene Burton, chairman Legislative Committee, Newark.

Representing Highway Transport Committee: Roy D. Chapin, chairman Highway Transport Committee, Washington.

Representing the Office of Public Roads, L. W. Page, director Office of Public Roads, Washington, D. C.

### Gilmore Heads Packard Branch

NEW YORK, Nov. 25—Roger J. Gilmore has been elected president of the Packard Motor Car Co. of New York. Gilmore, who has been vice-president of the company, has been in charge of its affairs since former President Hare was made executive vice-president of the parent company.

### Jamieson in Charge of Equipment Disposition

WASHINGTON, Nov. 23—Disposition of all manufacturing materials, equipment and buildings which will now or later become the property of the United States as a result of contract cancellations by the Ordnance Department will be in charge of a board headed by Brig.-Gen. C. C. Jamieson, which will decide their sale or storage.

F. E. Pierce, formerly advertising manager of the Anderson Electric Car Co., Detroit, has been appointed district manager for the Elwell-Parker Electric Co., manufacturer of industrial trucks and tractors, with headquarters in Detroit, and with factories in both Detroit and Cleveland.

L. C. Reynolds, formerly associated with the Oakland Motor Car Co., Pontiac, Mich., has been appointed manager of the motor factory of the General Motors Co. in Detroit.

H. W. Simpson, formerly inspector of aviation engines, Signal Corps, Detroit, has been appointed assistant engineer with Henry Ford & Son, Dearborn, Mich.

H. L. Dunn, assistant purchasing agent of the Willys-Overland Co., Toledo, has been transferred to Moline, Ill., where he will become identified with the Moline Tractor Co., recently acquired by John N. Willys.

### Propose Southern Air Mail Route

WASHINGTON, Nov. 25—The Birmingham, Alabama, Chamber of Commerce has requested Congress to place Birmingham on an air mail route between the Atlantic and Pacific Coasts. An aerial route is proposed to start at New York and go through Philadelphia, Baltimore, Washington, Virginia, the Carolinas, Charlotte and Atlanta, Ga., Birmingham, Ala., Vicksburg, Miss., Shreveport, La., Dallas, Fort Worth, Tex., Arizona and New Mexico and then to San Diego. There is already an aviation field constructed according to Government specifications at Birmingham. Senator Miles Poindexter will ask Congress for an appropriation to inaugurate this route and two others which will traverse the central and northern portions of the country.

### N. A. A. J. Directors to Meet

NEW YORK, Nov. 26—Directors of the National Association of Automobile Accessory Jobbers are to meet at the La Salle, Chicago, Nov. 16 and 17.

## Canadian Plant for Denby

CHATHAM, ONT., Nov. 25—At a special meeting of the Chatham City Council an agreement was signed between the city and the Denby Motor Truck Co. calling for the erection of a \$20,000 plant here, to be ready for occupancy by March 1. The company is newly incorporated in Canada, with a capital stock of \$200,000. The city will vote on giving the company three acres of land now, and an additional acreage will be made available if the company needs it within 4 years. The plant of the Chatham Brass Works here has been purchased by the Denby company, which plans to use it for the manufacture of axles and transmissions.

## Recall Aero Training Squadrons

WASHINGTON, Nov. 26—Thirty-one aero squadrons training in England have been recalled to this country and sailed from Liverpool Nov. 22. They included 5,000 enlisted men and 110 officers, besides a complete Handley-Page training section of 126 officers and 449 enlisted men.

## Federal Tax on Cars Dropped

WASHINGTON, Nov. 26—The Senate Finance Committee today entirely struck out the proposed federal license tax on the use of automobiles and motorcycles which ranges from \$10 to \$50 annually, according to horsepower, in the House Bill, and from \$5 to \$25 under the plan previously adopted by the Senate Committee. The National Automobile Chamber of Commerce plans to ask that the tax against parts sold by truck and passenger car makers also be stricken from the bill. It is believed that this tax is eventually and actually upon the consumer, the user of a passenger car or truck.

## Contracts for 300 Hydroplanes Cancelled

WASHINGTON, Nov. 26—Contracts for 300 hydroplanes have been cancelled by the Navy Department since the signing of the armistice. The Navy aviation appropriations for 1920 will be reduced as a result by \$133,770,700. These figures were presented to the House Naval Committee by Rear Admiral Peoples yesterday.

## Quartermaster Contracts

WASHINGTON, Nov. 25—The following contracts, placed prior to the armistice, have just been announced by the Quartermaster Department:

Timken-Detroit Axle Co., Detroit, axles, \$8,391.  
The Studebaker Corp. of America, South Bend, wagons, \$6,408.56.  
B. F. Goodrich Co., Akron, tires, \$19,041.50.  
The Atlantic Refining Co., Philadelphia, fuel oil, \$7,753.20.

## Tank Plant for Tractors

DETROIT, Nov. 25—Work will be pushed rapidly on the uncompleted plant which Henry Ford has been building at Dearborn for the manufacture of small tanks.

Ones Enlarged

## Substitute for Gasoline Tested

(Continued from page 933)

The type B fuel at full throttle resulted as follows:

	R.P.M.	Beam, Lb.	Consump- tion B.H.P.
Gasoline	523	125.5	21.9 0.13
"B" fuel	529	129.5	22.8 0.115

The airplane engine tests using 150 hp. Hispano-Suiza engine resulted as follows:

R.P.M.	Lb. Torque	Oil Inlet Fahr.	Water Inlet Fahr.	Air Intake Fahr.	Lb. Fuel
Liberty Fuel					
1583	335.0	154°	154°	91.4°	5
1389	326.0	158°	145°	87.8°	10
1194	332.5	148°	141°	86.0°	5

## Export Airplane Gasoline

1588	326.5	145°	162.5°	89.6°	5
1390	324.7	152°	161.0°	87.8°	10
1188	321.0	149°	158.0°	86.0°	5

## Export Airplane Gasoline

1600	330.0	125.6°	158.0°	85.0°	5
1400	326.0	134.0°	154.0°	89.0°	10
1200	322.0	141.0°	157.0°	85.0°	5

## Liberty Fuel

1600	340.0	146.0°	161.0°	89.0°	5
1400	340.0	152.0°	161.0°	87.0°	10
1200	332.0	146.0°	163.0°	86.0°	5

Following is the analysis made by the Bureau of Standards of the Liberty fuel submitted under Laboratory Tests Nos. 49,082 and 24,439:

Distillation, Per Cent	Fahr.
10.....	174.2°
20.....	176.0°
30.....	177.8°
40.....	179.6°
50.....	179.6°
60.....	181.4°
70.....	183.2°
80.....	194.0°
90.....	342.5°
95.....	388.4°
97 (dry point).....	405.0°

Following are reports made on two other samples of Liberty fuel which were tested by the Bureau of Standards on Sept. 10, test numbers being 45,962-3 and 24,135:

Fuel Appearance Odor	G Clear White Normal	F Clear White Normal
Specific Gravity at 60° Fahr.	.751	.730
Distillation	Fahr.	Fahr.
10	183.0°	161.0°
20	219.2°	183.2°
30	235.4°	203.0°
40	257.0°	221.0°
50	273.2°	237.2°
60	305.6°	249.8°
70	320.0°	262.4°
80	340.0°	280.4°
90	363.2°	309.2°
95	401.0°	341.6°
97 (dry point)	425.0°	
95.5 " "		360.0°
Residue	1.5%	1.2%
Loss	1.5%	1.3%

The future of this gasoline substitute is as yet undecided—that is, it is not known at this time just how the formula will be given out or sold or in what way it will be commercialized.

## Wright-Martin Working Three Shifts

NEW YORK, Nov. 21—Up to the present time the Wright-Martin Aircraft Corp., New Brunswick, has not received any cancellations of Government orders. The company is operating three shifts as usual and is producing nothing but Hispano-Suiza engines. Production is to be at a scheduled rate and will continue practically until the end of 1919. The only change which has been made in schedules has been the elimination of overtime work.

## Another G.-M. Canadian Plant

WINDSOR, ONT., Nov. 25—A site has been purchased and building may start shortly for a motor truck factory costing \$50,000 for the General Motors Corp., Detroit.

## Franklin Reduces Prices

SYRACUSE, Nov. 26—The Franklin Automobile Co. has reduced its passenger car prices. New and former prices follow:

Model	New Price	Old Price
2-Passenger	\$2,400	\$2,850
4-Passenger	2,450	2,900
5-Passenger	2,450	2,900
Sedan	3,350	3,900
Limousine	3,400	4,000
Brougham	3,300	3,850

## Probable Effects of War Motor Apparatus on Commercial Design

(Continued from page 906)

axles and lanterns. This car is also mounted on 36 x 6 pneumatics, the standard equipment being Goodyear cords with all-leather tread.

These are only random examples of a line of over a hundred different types of vehicles which have been adapted by the Motor Equipment Section for military use. The result has been the gathering together of as fine a collection of specialized designs as has ever been assembled.

It is not permissible even now, with the armistice in force, to go into full details on many of the products of the Motor Equipment Section, but it can be stated that in addition to the transportation and hauling equipment a great number of vehicles for offensive purposes have been developed.

The vast personnel required to perfect these vehicles will soon be released in large part from war service. The industry can utilize these men with wonderful results because they have been used to rapid and efficient work and they have gained experience in laying out highly useful designs adapted to give maximum service. Many of the ideas generated in the War Department offices can be taken bodily for commercial practice, while others are adaptable. It will be an important feature of our reconstruction work to utilize as much of the knowledge gained in war work as possible.

## Port Huron Friction Drive Tractor

(Continued from page 928)

neto of the high-tension type, with impulse starter, is fitted. Cooling is accomplished by forced circulation, through a Perflex radiator.

The fuel capacity is 25 gal. of kerosene and 5 gal. of gasoline, and the fuel goes to the motor through a Kingston single-bowl carbureter fitted with a Bennett air cleaner.

The steering gear is of the screw and nut type and the tractor has a turning radius of 6 ft. inside of the inner wheels.

The frame of the tractor is made of steel channels. The front axle is of the built-up type and carries a coil spring upon which the front end of the frame rests. The tread of the front wheels is 52 in. and of the rear wheels 56 in. The front wheels are 34 in. in diameter with 6-in. face, and the rear wheels 56 in. in diameter with 10-in. face.

The over-all length of the tractor is 13 ft.; total width, 6 ft. 3 in.; total height, including canopy top, 8 ft. 9 in., and the wheelbase, 7 ft. 9 in. Without fuel and wheel lugs, but with canopy top, the tractor weighs 5700 lb.

The speed of the tractor is variable from 1½ to 4 miles per hour, in either direction, and it is recommended for use with three 14-in. plows. The belt speeds are variable from 2380 to 3900 ft. per minute.

## Four Hispano-Suiza Models Built in America

(Continued from page 915)

cylinder block, a relief valve being placed in the line to prevent the pressure at the carbureter becoming greater than 2 lb. This valve can be adjusted in accordance with the varying altitudes at which the machine travels. Sufficient pressure for starting is obtained by using a hand pump. If desired, a vacuum tank system may be used, the vacuum being usually secured by taking a lead from the throat of a compound venturi, placed in the draft of the propeller, to the main gasoline tank, a check valve being placed in the line and a branch line leading to the auxiliary fuel tank.

A centrifugal pump with two discharge outlets, which is mounted directly underneath the oil pump, circulates the cooling water through the waterjackets of the two cylinder blocks. The water pump is driven from the same shaft as the oil pump at 1.2 times engine speed. Its capacity is 100 litres (26.50 gal.) per minute at an engine speed of 1450 r.p.m. The cylinder waterjackets have a capacity of 18½ litres (4.9 gal.), or, by weight, 18½ kg. (41 lb.).

An interrupter driving mechanism is used to fire a machine gun which is synchronized with the propeller. This mechanism is operated by a gear pinned to the lower gear on the lower half of the vertical shaft which drives the camshaft of either the left or right hand cylinder block. Two ball bearings carry

the interrupter shaft, which is driven at crankshaft speed. It is bolted by a double flange connection to the driving shaft, one shaft having one less bolt hole than the other. When the firing mechanism is properly set, a bullet fired from the gun will miss the trailing edge of the propeller by ¼ inch.

When fitting the Hispano-Suiza engine to a plane, it is anchored on a rigid support, lined at the points of contact with fiber or sheet metal, the engine base being set flat on the support members. To facilitate disassembly, the camshaft and valve gear housings are usually left exposed, enabling the plane constructor to use smaller cowls. When an engine is mounted without cowls, it is necessary to protect the magnetos by covers, usually of leather.

To carry away any gasoline that may overflow from the bowl of the carbureter or drip back during maneuvers in the air a small drain pipe is attached to a nipple at the bottom of the carbureter. The excess gasoline is discharged as far as possible to the rear under the planes and away from the exhaust lines.

## Contracts Placed

WASHINGTON, Nov. 23—Following is a list of contracts placed by the Bureau of Aircraft Production prior to the armistice and just announced:

Nov. 1

Ideal Clamp Mfg. Co., 25,000 hose clamps, 385.  
Champion Spark Plug Co., 12 spark plug cleaners, \$4.20.

## A New British Coke-Fired Steam Commercial Vehicle

(Continued from page 921)

returns the water of condensation to the tank through a filter in which the cylinder oil is extracted.

It will be noted from the foregoing description and accompanying drawings that the new Clarkson chassis is identical with a gasoline 3-ton model in all respects with the exception of the power unit, i.e., the frame, axles, gearbox and clutch of a 3-ton gasoline chassis could be fitted with either a gasoline motor or a Clarkson coke motor.

The increasing cost and scarcity in Great Britain of all liquid fuels, including gasoline, benzol, kerosene and alcohol, made it imperative to develop to the utmost extent the use of solid fuels. Of the solid fuels available coke is by far the most abundant as well as the cheapest form in which thermal units can be purchased. The consumption is about 5 lb. p.m. when loaded and 3.5 lb. when light, and it is calculated that at present prices in Great Britain the fuel cost per mile is approximately one-fourth as much with coke as with gasoline.

# Stewart Accessories For Ford Cars

The Stewart line of accessories for Ford cars represents a big opportunity for dealers.

Too many dealers overlook this big field. There are nearly 2,000,000 Ford cars in use today. Think of the thousands of Stewart Speedometers, Searchlights, Signals, Autoguards, etc., you could sell to these Ford owners if you would only go after the business.

Every Ford car should be equipped with Stewart Accessories. At the very least they should have a Stewart Speedometer and Instrument Board.

All it takes is a little effort on your part. If you will only take the trouble to look over the Ford cars that come to you—note the accessories that are lacking. Then tell the owner a few of the reasons why he should have a Stewart Speedometer, Searchlight, Autoguard, and so on. The results from this little effort will surprise you. And, if you go after the business with some enthusiasm and determination, you will soon realize a very handsome profit from the sale of Stewart Accessories.

Other dealers are doing this—why shouldn't you?

The Stewart Accessories are the easiest line to sell. They are so well known, so extensively advertised that they are already half sold before you stock them.

Nearly all Ford owners would buy more accessories if you—the dealer—would make it easy for him to get them. The only way is to carry a stock so you can show them to your prospects. But don't stop there. Show the accessories. Tell the car owners why they should have them. That is the way to bigger business and better profits.

*Stewart Automobile Accessories are sold by leading accessory dealers, jobbers and garages—everywhere.*

## Tractor Prospects in Siberia and Central Asia

Almost Unlimited Possibilities in Asiatic Russia—Population  
Has Been Largely Increased by Refugees from  
War and Revolution Swept Districts

By N. A. Stephanoff, M.E., Ph.D.\*

**T**HE question of industrial intervention in Siberia is now occupying the minds of many persons in the industrial circles of the United States. I regret to state, however, that the chaotic political situation in Russia, her internal troubles, the lack of reliable sources of information as to her economic conditions, and particularly those of Siberia and Central Asia, have so far prevented America from formulating any definite policy with regard to these countries, as far as economic assistance is concerned.

It is clear that Russia, and first of all Siberia and Central Asia, will greatly depend upon the United States, both politically and economically. It may be taken for granted that the big financial interests of America have already laid down a plan of action for the future industrial intervention in Siberia, and that they have taken full advantage of the lessons learned by French and Belgian concerns in Russia, who made the error of going there without sufficient preliminary study, and in consequence soon failed in competition with German capital, whose representatives are well organized and possess a thorough knowledge of Russian conditions.

### Unlimited Possibilities

From an industrial and economic point of view, Russia, and especially Siberia, Central Asia and Caucasia, are countries of unlimited possibilities. It is necessary,

however, to note that the opportunities exist only for a well-organized enterprise with a definite business program and a thoroughly developed plan of industrial intervention. Every adventure of a profiteering character is bound to fail—after a possible temporary success—when Russia will have recovered physically and morally.

### Stable Market Depends on Stable Buyers

Every student of industry well knows that a stable market for his goods depends upon stable buyers. Now, such a market can be created in Siberia and Central Asia in a short time. During the war and the revolution there was a great rush into Siberia of refugees from Poland and European Russia, with the result that the consumption there far exceeds the production of all articles of prime necessity. This raised the cost of living enormously. The issuing of large quantities of paper money and its accumulation in the hands of the farmers (about 10,000,000,000 roubles in Siberia and Central Asia alone) completely ruined the commercial machine, as the farmers could buy nothing from the cities, and therefore refused to sell their produce to them.

The industry of European Russia and Poland before the war was to a great extent under the control and influence of Germany. It is for this reason that the development of such important industries as sugar refining, textile manufacturing, etc., had been artificially hampered. Neither sugar nor clothes are to be found in Siberia and Central Asia now, nor any considerable

\*The author would like to express his indebtedness to O. A. Malychevitch, aeronautical and mechanical engineer, for assistance in collecting data concerning tractors.

quantity of shoes, consequently the balance of foreign trade will be very unfavorable to these countries during the first years after the conclusion of the war. Any considerable export of grain from western Siberia cannot be counted upon, as the normal conditions of trade between Siberia and European Russia, and through the latter with western Europe, will not be re-established in the near future. The Far Eastern markets and the Pacific Coast are inaccessible as yet because of lack of cheap transportation.

Siberia and Central Asia need not and will not be exclusively agricultural countries, as they possess immense natural resources (iron, copper, timber, coal, etc.) sufficient for an extensive industry.

### Siberia in Need of Manufacturing Facilities

The most urgent need in Siberia and Central Asia is the creation of facilities for manufacturing articles of prime necessity, such as sugar, textiles, shoes, etc. By creating such industries and by cultivating the personal requirements it would be possible to enhance the general welfare and the standard of intelligence of the population. It is necessary to establish an intensified agriculture comprising the raising of cotton, flax and hemp, cattle raising, the production of vegetable oils and animal fats, etc.

If this be the case, then there is in Siberia and Central Asia an immense opportunity for tractors, together with all the latest types of agricultural implements.

According to figures given in the "Statistical Annual" of the Russian Bureau of Trade and Industry for 1914,

TABLE 2

and in the "Statistical Yearbook" of the Central Committee on Statistics of the Russian Department of the Interior, the population of Siberia in 1915 amounted to 10,377,900, Central Asia having at the same time 11,254,000. Data collected by the writer while in Siberia in 1917 indicate that it would be more correct to estimate the population of Siberia toward the end of 1918 roughly at 14,750,000, and that of Central Asia at 13,750,000 (see Table 1). The increase in population has been almost entirely in the cities and towns. We are justified in assuming that the bulk of this immigrated population will not return home after the war is over and conditions in Russia have improved; on the contrary, we may even expect a further tide of new immigrants from European Russia, and in the first place of the lower middle class.

In order to answer the question as to how large will be the area of land that will be cultivated in Siberia in the near future, we must not only know precisely the population of the country but also the minimum food ration per person available, as well as the amount of man power.

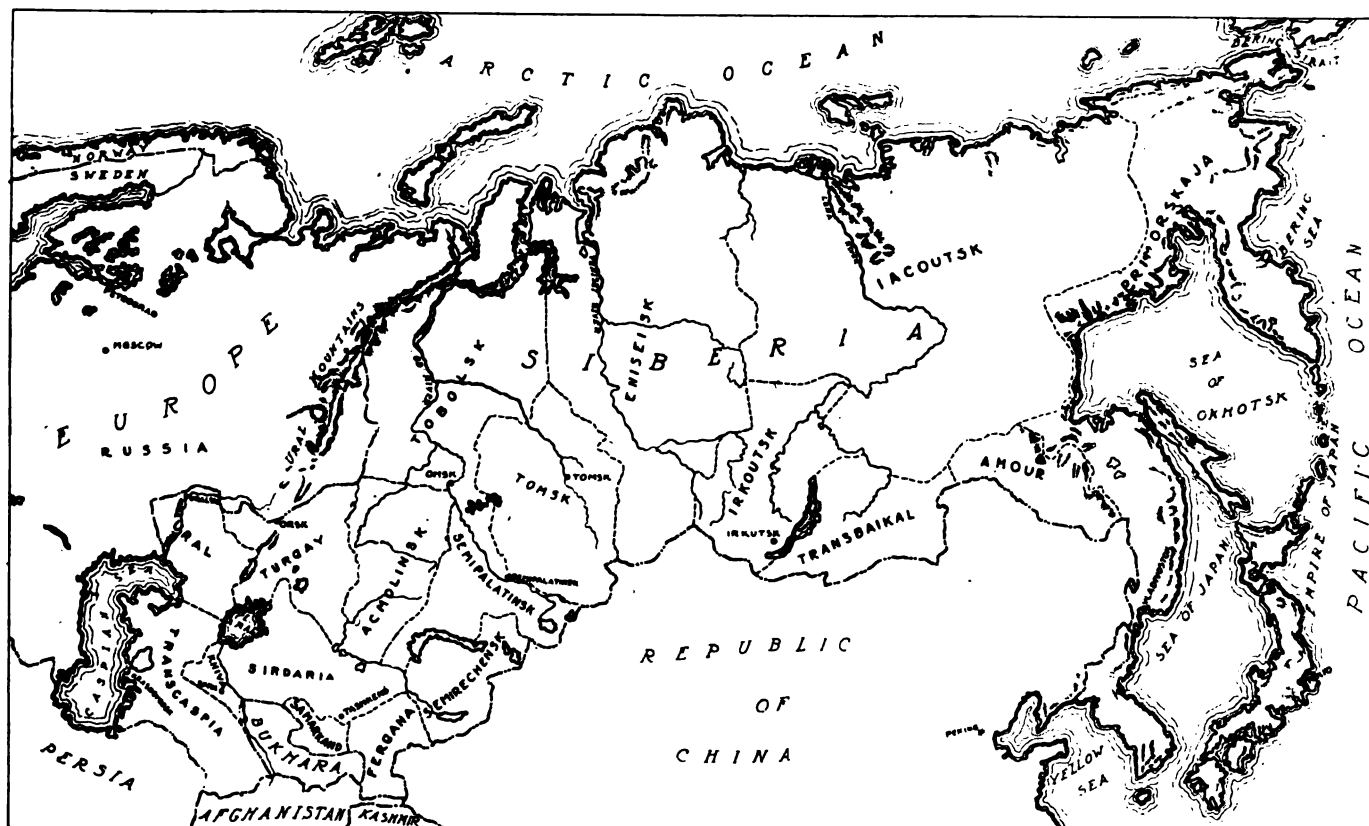

Siberia and Central Asia, as a whole, had never known starvation. Making an exception of the nomadic tribes, the food of the people used to be quite sufficiently varied, and contained enough meat, milk and fats. In this respect western Siberia, the province of Akmolinsk, and the neighboring regions of Central Asia, enjoyed especially favorable conditions. They exported a considerable part of their agricultural produce to eastern Siberia, to the provinces of Fergana and Trans-Caspia. This district is still the granary of Siberia and Central Asia; but there is one obstacle to further development: The farmers of the above mentioned fertile regions make no effort to increase the cultivated area to any extent, having no inducement to do so.

### Cities on Reduced Ration

As to the cities, they cannot expect to receive a full food ration for a few years to come, as they have nothing to give the farmers in exchange for foodstuffs; this accounts for the diminished ration (Table 2) for the entire city population and the country population under 9 years of age. The meat and the milk rations are excluded, as they bear no direct relation to the cultivated area and consequently to the question of tractors. Most of the area under cultivation in Siberia and Central Asia is sown to wheat; rye and barley are raised in small quantities, the distribution depending entirely upon climatic conditions. Table 3 shows the quantities of different cereals sown in 1912 (see also Tables 12 and 13). The crop is the chief factor in calculating the cultivated area, but the amount of collected grain is also given. Yield of grain is expressed in Russia in poods per dessiatina (1 pood = 36.1 lb.; 1 dessiatina = 2.7 acres).

Because of lack of data the average yield cannot be given in definite figures for Siberia and Central Asia. For illustration, reference may be made to Table 4, giving the yield in Siberia and Central Asia for the period 1908-1912, and Table 5 for 1912. For the period since 1912 the calculations were made by assuming a yield of 40 poods wheat and 30 poods rye per dessiatina. To simplify the calculations, the area under cereals is assumed to be all under wheat; this assumption is warranted because the total wheat crop exceeds the amount of rye raised, both absolutely and relatively.

Tables 6 and 7 show the area which must be sown to breadstuffs in Siberia and Central Asia in order to furnish a full yearly bread ration per person, which we estimate at 15 poods, corresponding to a full daily ration of 674.3 grammes and a half ration of 337.1 grammes of grain per person. (See Table 2.)

Map of Siberia and Central Asia

The area under other cereals called for will be determined by the yearly rations of:

(a) Grits or gruel,\* such as buckwheat, millet, barley, oats, rice, etc., of which a full ration is 4.5 poods per person and a half ration 2.25 poods; and

(b) Potatoes, of which the full yearly ration is 19.5 poods per person.

The average yield (full crop less the amount of seed necessary for the next sowing) is estimated at 18 poods for dessiatina for buckwheat and millet, 350 poods for potatoes in Siberia, and 250 poods in Central Asia.

The yearly ration of fresh vegetables is made up of 40 per cent cabbage,† 40 per cent beans (yellow beans, lentils, peas, etc.), 10 per cent cucumbers, and 10 per cent beets. Other vegetables, such as carrots, parsley, lettuce, tomatoes, etc., are consumed chiefly in the cities.

On the basis of the above consumption figures the area of truck farms required to raise the necessary vegetables for the whole of Siberia and Central Asia is 400,000 dessiatina, in round figures. Out of this, 200,000 dessiatina probably could be cultivated by means of tractors. The rest would be small gardens cultivated by hand labor exclusively.

\*The consumption of meat and fats being insufficient, cereals will play a pre-eminent rôle in feeding the city as well as the country population of Siberia and Central Asia, especially children. Cereals are used almost exclusively hot, with butter or milk.

†Cabbage is chiefly used in form of sauerkraut; cucumbers are salted. These proportions of various vegetables are the most unusual ones among the Russian farmers.

When first considering Tables 8 and 9 there seems to be a contradiction between the area to be used under wheat and buckwheat in 1919 and the actually cultivated area in 1912, for instance. The population of Siberia and Central Asia in 1912 was about 19,500,000; in 1918 it will probably be about 28,500,000; i. e., 46 per cent larger. Besides, the western part of Central Asia and eastern Siberia formerly obtained a certain quantity of cereals from without (European Russia and Manchuria); in pre-war times, moreover, there was a more plentiful supply of meat and fats, so there was no such need of using cereals as substitutes. However, we need not discuss this question at length, as it has no direct connection with our problem.

Among the other agricultural products, flax and hemp deserve serious attention as oil-giving plants, because they can be successfully raised in Siberia and several provinces of Central Asia.

The amount of fats in the food ration is figured at a

minimum, as the supply of fats in Siberia and Central Asia will be below the average in the first few years after the war. With a fat ration as given in Table 2, Siberia and Central Asia will consume 8,550,000 poods; butter cannot be counted upon in this quantity, as it is one of the most important items of export for Siberia, and a means of securing a foreign commercial balance. In normal times Siberia only consumed 5 to 7 per cent of her own butter, the production of which was about 5,000,000 poods in 1914. If we assume the same proportion for 1919, a minimum of 8,300,000 poods of vegetable oils has to be supplied to take the place of animal fats. Central Asia can meet the whole of this demand with cotton-seed oil. However, the necessary quantity cannot be guaranteed at present, owing to the decreased area in cotton in Central Asia, especially in the provinces of Fergana and Transcaspia. Owing to a reduction in the supply of bread cereals from without, the farmers of these regions were compelled to raise their own food stuffs.

### Flax and Cotton Raised for Their Oils

If we assume the average amount of fat obtained from the seed to be 15 per cent, we shall require 27,670,000 poods of flax and hemp seed in 1919, which does not include the cotton-seed oil expected from Central Asia, this latter oil constituting 50 per cent of the general oil consumption of Siberia and Central Asia.

Table 10 shows the average yield of seed and fiber for the period 1908-1912. The net yield of flax and hemp is assumed to be 20 poods seed and 25 poods fiber. These figures make it necessary to have a minimum area

of 1,383,500 dessiatines under flax and hemp in 1919, which would result in 35,000,000 poods of raw fiber, representing a great export value.

In order to simplify the calculations we give the area under other cereals in per cents, in addition to the data of Table 3. Thus we see that the whole cultivated area in 1919 should be at least 23,886,000 dessiatines, as per Table 11.

Furthermore, we should consider the loss of grain in transit, possible loss from fire, and a minimum allowance of 15 per cent for partial crop failure. Adding these, we arrive at a total cultivated area for Siberia and Central Asia of about 30,000,000 dessiatines in 1919, which can serve as a basis for further calculations. This figure is arrived at on the assumption that it is necessary to raise enough produce to allow of a satisfactory minimum food ration for the population of Siberia and Central Asia.

### Horsepower and Man-Power Required

What is the necessary amount of horsepower and man-power for the cultivating of this area?

The average depth of plowing in Siberia does not exceed  $4\frac{1}{2}$  in. It is hardly necessary to point out that this is not enough even under existing conditions. Taking as average draft in wheat stubble 5 lb. per square inch, the total draft for a 5 x 12-in. furrow would be 270 to 300 lb. In virgin gumbo soil, which will make up more than 50 per cent of the acreage under intensified cultivation, the total draft would be as high as 800 to 900 lb. per plow.

The average draft of a horse in plowing is equal to one-tenth of its weight, which latter for a Siberian horse amounts to about 900 lb. We would need three horses to pull a foot-list, beam-hitch sulky plow with steel plow bottom. But we have to take into consideration that the Siberian horse, though a very good and enduring runner, is not a good draft horse for general farm purposes, and therefore in Siberia or Central Asia one horse will be required to cultivate 10 dessiatines, or 27 acres for a year.

These figures show that 30,000,000 dessiatines under the plow in Siberia and Central Asia, with a draft 5 lb. per square inch, will require at least 3,000,000 horses, while over 6,000,000 horses will be required if 50 per cent of the 30,000,000 dessiatines is new-broken ground. The statistics for 1912 show\* that there were in Siberia and Central Asia 4,506,000 and 4,435,000 horses respectively. Of these 9,000,000 horses, probably 5,500,000 were used on the farm, the remainder comprising colts and breeding stock required to keep up the supply for

\*According to available data the absolute increase of horses throughout Siberia and Central Asia in 1912-1917 was negligible owing to reasons which are not within the limits of this article. The number of horses in Siberia was 4,328,000 in 1908 and 4,506,000 in 1912; the number of horses in Central Asia was 4,602,000 in 1908 and 4,435,000 in 1912.

town and country, the driving horses and the idlers. Therefore, the available number of horses will hardly cover the requirements of intensified agriculture.

Let us now see how many laborers there are among the country population. By a fully efficient laborer we mean one between 19 and 50 years of age, and by a half-efficient one a laborer between 15 and 19 or between 50 and 55. From the whole country population we must exclude certain nomadic tribes (the kirgys, kalmyks, booriats, yakoots, bashkyrs, toongoos, etc.), to whom agriculture is almost unknown; these tribes number altogether about 8,750,000.

This gives an able agricultural population of about 13,111,800, among whom there are about 4,785,000 fully efficient laborers, men as well as women, and about 1,625,800 male and female half-efficient laborers. There will, therefore, be sufficient manpower to cultivate the 30,000,000 dessiatines.

### Modern Implements Lacking

It appears from the above figures that Siberia and Central Asia are in some respects in about the same state as the United States was in the 80's. There are, however, many points of difference, of which the chief one is the lack of up-to-date agricultural machinery. This must be introduced, together with the tractor. The experience of the United States shows that the horse cannot compete with the tractor, and that, on the other hand, the tractor cannot entirely replace the horse. The advantages of the tractor are of an entirely different character than those of a horse, namely:

(1) The tractor does such heavy work as would be entirely impossible for the horse, and can do it whenever it is most necessary, since it places at the command of the farmer, the co-operative society and the State a vast amount of power to be utilized at the proper season of the year. It is well known how important it is in agriculture to have certain kinds of work done at the proper time. The experience of the Bezenchok Agricultural Station in the province of Samara, Russia, proved this conclusively in 1911-1913, as far as the spring

sowing of wheat and oats is concerned, as appears from the following figures:

YIELD PER DESSIATINA IN POODS

1911—DRY YEAR					Day of Sowing	WHEAT	
Day of Sowing	WHEAT CROP		OATS CROP			Grain Poods	Straw Poods
	Grain Poods	Straw Poods	Grain Poods	Straw Poods			
April 13..	16.7	43.3	13.6	40.8	April 7...	96.6	200.4
April 30..	14.7	50.2	8.7	38.9	April 12...	86.6	179.0
April 25..	7.4	43.5	7.1	35.5	April 17...	58.5	133.3
					April 27...	35.6	107.3
					May 5....	25.6	50.7

In Siberia May 10 is the limit for drilling grain, with five to six weeks time previous to that for plowing.

(2) The ability of a tractor to plow to a good depth, especially in hot weather, and to work at night as well as by day. The joint use of the tractor and the horse allows the farmer to increase the cultivated area, and a detailed study of the requirements of Siberia and Central Asia shows that an increase on a large scale is the only way to supply these countries with sufficient food.

(3) The tractor is capable of many different kinds of work and raises the general efficiency of an agricultural unit; this is particularly true if we consider a machine with a two or three-speed transmission. The part of the tractor in other agricultural operations, such as reaping, threshing, transportation, etc., is no less important.

### Transport Facilities Must Be Developed

Besides the growing of grain, Siberia and Central Asia are looking forward to railroad construction and the development of other ways of communication on a huge scale. Enormous investments will be made for the erection of grain elevators, for the equipment of sugar refineries, factories for textiles and household articles, etc. To raise the money for such investments, Siberia and Central Asia must create a satisfactory balance in foreign trade, which can be accomplished only by placing her agriculture, and particularly the production of plants

possessing an industrial value, such as cotton, flax, potatoes, beans, etc., on a more intensive basis.

The development of agriculture will constitute a serious task to the government of Siberia and Central Asia. It is not within the province of this article to consider in detail the possibilities of the future export trade of Siberia and Central Asia. But considerations of even a most general character lead to the conclusion that the population of Central Asia and Siberia, as per Table 1, needs more than 60,000,000 desiatines of cultivated land to permit of a higher standard of living. This advancement will hardly be achieved unless tractors are introduced and the farms are equipped with modern implements generally.

We do not need to fear unemployment as a result of the use of machinery for farm work; any surplus of labor will find employment in the industries, especially in sugar refining, textile manufacturing, in the pulp, cellulose and paper factories. As far as the latter industry is concerned, the possibilities of Siberia are unlimited, and in connection therewith the tractor will prove of still greater importance, paving the way for more complicated machinery.

### Possible Demand for Tractors

Let us see what would be the result if the agricultural work to be done in Siberia and Central Asia were done by means of tractors. We do not intend to make a comparison of various kinds of tractors. But it is clear that a 3-plow tractor with 15-30 b.hp. engine would be the most suitable one for Siberia and Central Asia. With a 7 x 14-in. furrow and an average speed of 2½ m.p.h., the average draft being 7¾ lb. per sq. in., the tractor will plow 1 desiatina in 3 hours, which makes 300 desiatines in the 900 hours of the yearly plowing time. For the necessary minimum of 30,000,000 desiatines a year 100,000 tractors would be needed; considering that the average life of a tractor is 5 years, Siberia and Central Asia would need 20,000 new tractors yearly. There would be yearly requirements of 50,000,000 poods of kerosene (about 7 gallons per desiatina), about 120,000 poods lubricating oils and about 750,000 poods of heavy grease for the gear box.

As soon as normal conditions are restored there will be no great difficulty in supplying these quantities to Siberia and Central Asia from Baku by way of the

Caspian Sea, Volga River, Oural River, etc. On the other hand, eastern Siberia can be supplied with kerosene from Baku via Batoom, the Black Sea, etc., to Vladivostok.

With regard to the present and the immediate future the horse undoubtedly has the advantage over the tractor, owing to the exorbitant cost of kerosene and lubricating oils. But this will all be changed as soon as Siberia and Central Asia introduce industrial agriculture, producing vast quantities of cotton, flax, hemp, vegetable oils, animal fats, alcohol, sugar, etc. We may say with perfect assurance that only by means of tractors will it be possible for Siberia and Central Asia to treble in the next 10 years their cultivated area and thus to create for themselves a favorable export balance. It is clear, also, that Siberia and Central Asia must develop their smaller industries, out of political and economical consideration, in order to make the population spend the idle winter months in an efficient way. These industries include timber work, spinning, weaving, milling, dairying, soap making, etc., all of which can be established and organized permanently only with the aid of tractors.

The introduction of tractors in Siberia and Central Asia can be accomplished only by means of a comprehensive plan of work, a well-organized credit system, and—what is still more important—a previously developed campaign of tractor propaganda on well-equipped experimental farms and small shops.

Assuming that in the beginning Siberia and Central Asia were supplied with only 10 per cent of the whole number of tractors they will eventually need, this would call for about 2000 tractors.

Tables 12 and 13 show the agricultural characteristics of the different provinces of Siberia and Central Asia, and also contain data concerning the cultivated area in 1912.

### Conclusions

(1) The introduction of tractors, together with improved agricultural machinery and industrial tools, is absolutely necessary to promote industrial agriculture and the smaller industries in Siberia and Central Asia.

(2) It is necessary to organize, during the next 3 years, a widespread propaganda of tractors. For this purpose there should be established a number of experimental stations in the shape of farms under the management of capable instructors. At first they should be established in the provinces of Tobolsk, Tomsk, Akmo-linsk, Amur and Primorskaya but later on the net of experimental farms and model industrial units, together with repairshops, should be extended as far as possible.

(3) Stores of fuel and other supplies necessary for the efficient operation of tractors should be established; there must also be a completely developed and practical plan for supplying the farmers with these materials.

(4) Special banks should be opened, a bank of agriculture and a bank for small industries, offering liberal

credit to farmers who desire to introduce tractors on their farms or to establish small factories and mills for manufacturing various kinds of ready-to-use goods and articles from local raw materials. The power of these banks should be widened so as to entitle them to exercise control over the choice of grains to be sown, and over the exportation of agricultural produce and manufactured articles from Siberia and Central Asia. To successfully accomplish this it is necessary for the promoters to establish close relations with the Siberian co-operative companies and with the local government.

(5) Much patience will be needed, as no considerable returns can be expected until the whole trading system of Siberia and Central Asia can be put into shape, which will require about 5 years of hard work. By that time

the agriculture of these countries will be placed upon a substantial footing.

(6) A well-conceived and well-elaborated policy, firmly adhered to, in full accord with the mass of the population of Siberia and Central Asia, is the only means of taking advantage of the immense opportunities for the tractor in these countries, and later on in European Russia and Caucasasia.

(7) Haphazard industrial intervention, based on selfish interests only, would introduce into these countries machinery of questionable quality. If this should happen the future of the American tractor in that part of the world could very easily be ruined, which would be a most unfortunate thing, considering the great advantages of the best makes of American tractors.

## Automatic Variable Speed Generator

THE Harvey-Taubert Mfg. Co., Los Angeles, Cal., recently formed for the purpose of manufacturing electrical specialties, will soon place on the market a new automatic variable speed generator, designed to maintain a substantially constant flow of current under variable speed. This generator is specially suited for use on motorcycles and automobiles. It is of standard form, but is made in two types, one for use without a battery (on motorcycles and trucks), and the other for use with a battery. The latter type is provided with a cut-out switch, which is enclosed in the generator housing, so that the whole forms a single unit.

The minimum speed required to produce full load is very low for this type of apparatus, viz., 1200 r.p.m. armature speed, which with a gear ratio of 2 to 1 corresponds to 600 r.p.m. engine speed.

The regulating mechanism is mounted as a unit directly above the generator proper, and is enclosed. It comprises a ball governor and an auxiliary commutator. The motion of the balls under the centrifugal force serves to actuate brushes

connected with the commutator for regulating resistance connected therewith, according to the speed of the armature shaft. The auxiliary commutator is stationary, and of internal contact design. It is of improved wedge construction, with the resistance mounted on its periphery. Should it become necessary to resurface the commutator, the whole unit can be easily removed. The wiping action of the brushes, rocking as the speed is increased or diminished, has a tendency to polish both the commutator and the brushes. As no voltage is generated between bars under the brushes in the regulating means, no sparking occurs. A speed variation of 5 to 1 may be taken care of.

We are informed that the generator has been thoroughly tested, and that applications for a patent on it have been filed. It was designed by E. E. Taubert, who was the organizer of the A-B-C Generator Co., now well known in the motorcycle field.

The Harvey-Taubert Mfg. Co. is located at 633-5 S. Los Angeles Street, Los Angeles, Cal.

# Dixie Standard Aircraft Magneto

**A Few Extra Parts Permit of Converting an 8-Cylinder 90-Deg. V Engine Magneto Into One for Almost Any Other Type of Aircraft Engine—Methods Used in the Manufacture of Magneto Magnets**

A GREAT opportunity offered itself to magneto manufacturers at the outbreak of the war in connection with the development of ignition apparatus for aircraft engines. Pre-war aircraft invariably carried magnetos and as Germany had been the main source of supply of these machines, the demand upon manufacturers in allied and neutral countries increased enormously with the outbreak of hostilities. American manufacturers were perhaps better prepared to take care of this demand than manufacturers in England and France, not only because of their much larger facilities but also because they already had had experience in producing magnetos for multi-cylinder automobile engines. It is no wonder therefore that our magneto concerns secured considerable European business from the very beginning of the war.

Among the American concerns which have been most active in the development of magnetos for aircraft engines is the Splitdorf Electrical Co. of Newark, N. J. It has furnished its Dixie magnetos in large numbers for Hispano-Suiza, Curtiss, Le Rhone, Hall-Scott and Bugatti engines built in this country and it has also supplied smaller numbers for other makes of engines. The special achievement of the Splitdorf engineering department in connection with aircraft work is the production of a standardized line of magnetos so that by the use of only sixteen extra parts the standard magneto for eight-cylinder engines can be converted into six other models covering practically the whole range of aircraft engine types.

The demand for aircraft magnetos confronted ignition experts with a number of distinct problems. In the first place the magneto must be absolutely reliable. There

must be nothing on it that can break or shake loose in spite of the terrific vibration on an aircraft engine. Next, the machine must be light, as every pound of additional weight detracts from the speed, climb and ceiling of the machine and reduces its fighting value by just so much. Finally, it appeared at the outset that a great variety of types of engine would be used for different classes of planes, and as it was essential to get into production quickly it was necessary to adopt a single general design to different types of engines with the least possible number of changes. This the Splitdorf company set out to do and how well it has succeeded may be judged from the following description of the Dixie line.

Generally speaking, the Dixie aircraft magneto is of the same type as the automobile magneto of the same make. It operates on the distinctive Dixie principle without revolving windings and its magnets straddle the rotor lengthwise instead of transversely. However, before going into details of construction it will be best to explain how the single design of magneto is adapted to the different types of engine, as the solution of this problem forms the Splitdorf company's chief contribution to the carrying out of our aircraft program.

## Eight Cylinder the Basic Type

The basic type is the eight-cylinder 90-deg. V, the earliest as well as the greatest demand having been for magnetos for such engines. The eight-cylinder 90-deg. V Dixie magneto has a four-wing rotor, in which respect it differs from the Dixie magneto for four- and six-cylinder automobile engines which has a two-wing rotor. This eight-cylinder aircraft magneto generates four im-

*Dixie eight-cylinder magneto and extra parts required to convert it into six other models*

pulses per revolution, exactly the same as the number of sparks required by the eight-cylinder engine. Also, with a 90-deg. V the sparks must come at equal intervals, as do the impulses of the magneto. The distributor gearing is the usual 1:2 gearing, the distributor having eight equally spaced contact segments all in a single circle.

Four-cylinder engines have been used to quite an extent for training planes and this is the smallest number of cylinders to which the magneto has been adapted. The four-cylinder model is very much like the eight-cylinder one, only two extra parts being required to convert the latter into the former. One of these is the distributor block, which has only four contact segments instead of eight, and the other is the breaker cam. As the magneto is driven at crankshaft speed and has the same magnetic circuit arrangement as the eight-cylinder model, four electric impulses will be generated per engine revolution, whereas only two sparks are required per revolution. The four-cylinder magneto is driven at the same speed as the eight-cylinder model, and every second current impulse is simply suppressed, by so constructing the breaker cam as to hold the primary circuit open during every second impulse. The type of cam used is illustrated herewith. It has two oppositely located lobes which cause the circuit to open at moments corresponding to the peaks of alternate inductive impulses and holds the primary circuit open during the period of the intermediate or unessential impulses, thus preventing the production of a spark during these intervals.

Next comes the six-cylinder model, which requires a different distributor block, a different cam and a different set of distributor gears as compared with the eight-cylinder model. In order to produce three sparks per revolution of the crankshaft, the rotor is driven at one and a half times crankshaft speed, thus insuring the production of six sparks per two engine revolutions, of which every other one is suppressed by means of the breaker cam. This breaker cam is the same as that used for the

*The eight-cylinder magneto complete*

four-cylinder magneto. It is obvious that the high tension distributor must run at one-half crankshaft speed, and since the rotor is geared to run at one and one-half times crankshaft speed, the distributor gearing must give a speed reduction of 3 to 1.

No particular difficulty is encountered in adapting the magneto to the ignition of twelve-cylinder, 60-deg. V engines. Running it at one and one-half times crankshaft speed results in the production of six impulses per revolution, equal to the number of sparks required, and as they are evenly spaced, the sparks come in the correct order for firing an ordinary twelve-cylinder engine. The gears used, therefore, are 3 to 1. On account of the necessity of maintaining a space at

least  $\frac{1}{2}$  in. between distributor segments, a narrower distributor brush is used.

#### Special Field Structure in 16-Cylinder Type

For use on a sixteen-cylinder engine with equally spaced explosions, such as the Bugatti, the magneto is driven at one and one-third times crankshaft speed, and a special type of field structure and rotor are used. The rotor has six wings, so that six impulses are induced in the armature winding during each revolution. Rotating at one and one-third crankshaft speed, the number of impulses is equal to eight per crankshaft revolution, and to sixteen during two crankshaft revolutions or one complete cycle of the engine. Forming the rotor with six wings makes the individual wing comparatively narrow, and would result in an inadequate pole surface if the field pole masked only one wing at a time. Therefore, the field structure is so made that each field pole masks at the same time two of the wings of one rotor pole. In this way the effective gap area is even larger than with the four-wing rotor, and the magnetic flux is increased. This magneto also requires a special distributor block with 16 contact segments, special distributor gears giving a reduction ratio of  $2 \frac{2}{3}$  to 1, a special cam with six equally spaced cam lobes, and the same narrow dis-

*Longitudinal and cross section of Dixie aircraft magneto*

tributor brush as used in all of the multi-cylindere types.

The first Liberty aircraft engine ever built was an eight-cylinder 45-deg. V, and the Splitdorf company developed a magneto model for this. In an engine of this type the explosions do not come at equal intervals, but at intervals of 45 deg. and 135 deg. of crankshaft motion, and the sparks must be similarly timed. This requires a special distributor block with contact segments arranged in four pairs, the angular distance between the contacts of each pair being 22½ deg. The rotor is driven at twice crankshaft speed. In this model the ordinary rotor with four wings is used, which is capable of producing four impulses per revolution. Hence, eight impulses are produced per crankshaft revolution, or one impulse every 45 deg. Of these, two succeeding impulses are utilized for the production of sparks, and the next two impulses are suppressed. This requires a special cam, which opens the circuit at 90 deg. and 270 deg. intervals of its revolution. The brush used in the distributor of this model is of the narrow type, as the two contact segments of a pair are very close together.

#### Liberty Engine Model

The last model of the set is that for twelve-cylinder, 45 deg. V engines, such as the Liberty 12. This model has the special six-wing rotor and corresponding field structure, and as it is operated at one and one-half times crankshaft speed, it generates nine impulses per crankshaft revolution. In a twelve-cylinder, four-cycle engine there are necessarily six explosions per revolution, or one explosion every 60 deg. of crank motion. If the two sets of cylinders are set at an angle of 60 deg. the explosions will be equally spaced. If the angle of V is less than 60 deg., the shortest interval between explosions is equal to the angle of V, and the longer interval is equal to 120 deg. minus the angle of V. In the case of the twelve-cylinder 45 deg. V engine, the intervals between explosions are 45 and 75 deg.

As the rotor is of the six-wing type and rotates at one and one-half times crankshaft speed, it induces nine impulses per revolution, or one impulse every 40 deg. Of these two successive impulses are used, and then one impulse is suppressed. This makes the spacing of the peaks of the utilized impulses 40 deg. and 80 deg. However, it is not necessary to interrupt the primary circuit exactly at the moment of maximum induction in it, and by sometimes interrupting it immediately before the moment of maximum induction, and at other times immediately after the maximum induction, the intervals between sparks can be made 45 and 75 deg. instead of 40 and 80. The breaker cam used on this magneto has four cam lobes, the "opening" edges of which are 67½ and 112½ deg. apart. These

angular displacements of the cam edges, it will be noticed, are equal to one and one-half times the angular intervals between explosions, this multiplying factor depending upon the multiplication of rotor speed as compared with the crankshaft speed.

#### Manufacture of Magnets

Considerable improvement in the composition of magnet steel has been made in recent years, and the Splitdorf Electrical Co. claims that the magnets of its magnetos will not lose their strength within the life of the magneto provided the magnets are not removed and abused. Magnet steel is rather expensive material, and in order to eliminate waste, the bars are ordered in lengths which are exact multiples of the length of the individual magnets. After having been sheared off to the correct length, the bars are heated and bent to U form by means of a bulldozer. While still hot, they are inspected for shape by means of gages, and corrected, if necessary. Next they are accurately ground to shape and the holes for the armature shaft to pass through are punched. Then they are heated and quenched and subjected to a magnetizing process by being inserted into a double magnetizing coil through which a powerful current is sent momentarily by means of a switch.

There is one magnet, known as a master magnet, in the magnetizing coil, and the magnet to be magnetized is placed with its poles against those of the master magnet, so that the two together form a closed magnetic circuit. After the magnetization has taken place the pair of magnets are drawn to one side so that the newly magnetized magnet is entirely out of the coils, and a keeper is placed over its poles on the side, as shown in the sketch herewith. This keeper remains in position until the magnet is assembled on the magneto and the rotor is in place, which latter practically completes the magnetic circuit. The writer was informed that this precaution of never opening the magnet circuit from the time the magnet is magnetized till the magneto is assembled would be of no use with ordinary forms of field structure, as with these the armature reaction when the magneto is in operation causes a greater weakening of the magnetism than leaving the magnets open-circuited. In the Dixie magneto, owing to the comparatively high leakage factor of the magnetic circuit through the armature coil, the armature reaction is less pronounced. Tests made show that the reduction in field strength caused by armature reaction, after the magneto is first put in operation, is only about 5 per cent in the Dixie.

#### Testing Magnets

The aging process, formerly largely employed in the manufacture of permanent magnets, has been done away with, but each magnet, after it is withdrawn from the magnetizing coil, is subjected to a checking test to determine its magnetic strength. The apparatus employed in making this test consists of an exploring coil of rec-

*Six-winged rotor and corresponding field structure. Each field pole masks two rotor wings*

tangular shape, which is connected to a slow period ballistic galvanometer of the mirror type with damping feature. The light from the lamp used in connection with this galvanometer is reflected by the mirror onto a scale directly above the coil into which the magnet is inserted, and directly in front of the operator.

The operator introduces the magnet into the coils so that the latter is interlinked with the entire flux, and then withdraws the magnet with a smart motion. In this way all of the lines of force extending from pole to pole of the magnet are cut by the coil, and as the moving system of the galvanometer has a very slow period, the indication which it gives is directly proportional to the total quantity of electricity induced in the coil by withdrawing the magnet from it—in other words, to the flux of the magnet. In fact, the scale of the instrument is graduated so as to indicate directly the total number of lines of force of the magnet. A certain minimum flux corresponding to 60 C. G. S. units of coercive force is required with each type of magnet, and if a magnet shows less than this, it is scrapped. After the magnets have passed this test, they are placed in storage, but before they are assembled in the magnetos, they are recharged once more.

#### Structural Details

The end plates and base of aircraft magnetos are made of aluminum castings, and are held together by collar screws turned from the solid. The magnets fit snugly into this assembly of base and end plates, and are held rigidly in place by means of a steel strap which is hinged to one of the end plates and secured to the other one by means of an eye bolt. All screw connections are locked by the use of split washers, nuts and lock nuts.

The breaker is the regular Splitdorf type, and comprises a breaker arm of somewhat irregular shape. In order to facilitate the manufacture of this arm, the company makes use of extruded bar stock of a section similar to the breaker arm, which is sawed off to the thickness of the arm and then milled to lighten it. All magneto-fired aircraft engines use fixed ignition, and it is not necessary to mount the interrupter on a rocking base. This, of course, simplifies the construction. The absence of any need for variable timing also simplifies the design of the distributor. For services in which allowance must be made for considerable variation in the spark timing, the distributor segments must be of greater length circumferentially, and it is impossible to get more than six segments in a single circle. Distributors for eight and twelve-cylinder engines are then made with the segments arranged in two circles, side by side. With fixed spark the distributor contact segment can be made very short or narrow, and any number up to sixteen can be placed in a single circle.

#### Gap Type Distributor

In four, six and eight-cylinder magnetos the Splitdorf company has been using the regular brush type of distributor, because in the early part of the war the Government insisted upon adherence to this time-tried construction. In magnetos for twelve and sixteen-cylinder engines, the so-called open gap distributor is used, which will eventually be made the standard for all models. In this the revolving distributor brush is replaced by a revolving pin, and the distributor segments, instead of being turned down flush with the insulating material, slightly protrude from the insulation, and have a serrated formation of their sparking surface. This, as is well known, tends to facilitate the ionization of the air, and the breaking down of the air gap by the electromotive force.

*Dixie' method of magnetizing magnets*

For its aircraft magnetos, the company has been using a special insulating compound of its own, known as Americanite, which has a rubber base. One of the advantages of this compound is that it forms a very smooth track for the distributor brush. Besides it has a very high mechanical and dielectric strength.

Most of the aircraft magnetos which have been manufactured by the Splitdorf company are provided with a trailing brush in the distributor, which allows of starting the engine by means of a hand-operated high tension magneto. Connection from the hand magneto is made to a terminal at the center of the distributor block, which connects through a carbon brush and central contact on the distributor plate to the trailing brush. The connection from the high tension winding of the service magneto to the regular distributor brush is made on the opposite side of the plate, as clearly shown in the sectional view.

The advantage of the hand-operated magneto is that the engine may be turned over a couple of times by means of the propeller with the switch off, the operator then returning to his seat, throwing on the ignition switch and giving the hand magneto a turn, which produces a shower of sparks at the plugs insuring easy starting. This obviates any danger from the propeller.

#### British Aeronautical Society's Lectures

FOR the coming winter the Royal Aeronautical Society of Great Britain has arranged an interesting program of lectures. With the exception of three special lectures, the opening, popular and juvenile lectures, the subjects will be of scientific and technical character. Following is the list of the lectures, with the names of the lecturers and the dates: Shop Practice in Respect to Aircraft Steels, by Brig. Gen. R. K. Bagnall-Wild, Dec. 5; Civil Aerial Transport, by Claude Grahame-White, Dec. 11; Full Scale Aeroplane Experiments, by Capt. W. S. Farren, Dec. 18; To Constantinople and Back by Aeroplane, F. Handley Page, Jan. 8; Medical Aspects of Aviation, by L. E. Stamm, Jan. 15; Rigging of Aeroplanes, by Capt. R. J. Goodman-Crouch, Jan. 29; Fabrics and Dope, by F. W. Aston, Feb. 12; Points on Aeroplane Design, by Capt. F. S. Barnwell, Feb. 26; From Model to Full Scale in Aeronautics, by H. Levy, March 12; Lighter Than Aircraft, by Lt. Col. T. R. Cave-Brown-Cave, March 26; Aluminum Alloys for Aeroplane Engines, by Prof. T. C. Lea, April 26. The Wilbur Wright lecture will be given in May, and the annual general meeting of the Society will take place on March 19.

THE average production of benzol per ton of coal is in the neighborhood of 2½ gal. Seventeen and a half million tons of coal are at present being carbonized in Great Britain in recovery ovens, and this should accordingly yield approximately 44,000,000 gal. of benzol in the crude form.

# Co-ordination of Legislative and Operative Functions in Labor Essential to Success

By Harry Tipper

**EDITOR'S NOTE**—*The second part of this series, beginning with this article, will deal with the organization fundamentals and changes, as well as the newer experiments in organization and their advantages. Consideration will be given to the different industrial problems of organization.*

**I**N all group organizations established for whatever purpose by human beings, whether social, political, or industrial, for general or specific purposes, the functions required for the orderly progress of the organization divide themselves into the legislative and the operative.

In the earlier forms of organization where the necessities of operation were few, and consequently the necessity for legislation correspondingly simple, the same machinery could be made to serve both purposes. But the functions remain separate.

The operative functions require continuous decision, supervision and obedience to that supervision. They require the lodgment of large powers in the governor or leader, and an equally large measure of acquiescence in those who are subject to the government.

The legislative functions, on the other hand, dealing with those matters of rule and regulation and agreement by which the group shall remain in orderly co-operation depend for their permanency upon discussion, upon examination of all the possibilities, and upon agreement as to the conditions.

It is obvious, of course, that the operative functions represent the paramount necessity of any organization of human beings. It is necessary that all the operations of life should continue unless life itself is to cease.

But where the individual of the group depends for a part of his living upon the operations of other members of the group, the legislative necessities are of similar importance.

The legislative functions of the groups of Scandinavians who operated together under one leader in their first descent upon the British coast were easily disposed of by a meeting of all the free men of the group once a year, and the operative functions were started by the selection of a leader, and the oath of obedience to him.

In the early industrial groups where the numbers were small and the requirements of the group very simple, a few rules and regulations were easily disposed of between the leader and his subordinate, without the necessity of creating special machinery for the purpose, or without the necessity for constantly reviewing and adjusting the conditions.

## Military Type of Organization

This type of organization, the military type, as it might be termed, remains in essentials the usual type of industrial organization to-day. The necessities of industry and industrial groups have become more and more complicated; the groups themselves have become

larger and larger, and the questions for adjustment in the rules and regulations have occupied a corresponding increase of time.

While therefore the military system of organization remains essentially the usual system in industrial affairs to-day, other organization efforts have grown up outside the industrial unit in the attempt to provide for these increased legislative necessities, and at the same time permit the necessary efficiency in operation.

Unquestionably the operative function of an industrial organization requires a system which should in its character approach the military, and to this extent, and for this purpose, the customary industrial organization is the correct one.

The industrial difficulties have arisen from the fact that the purely military system of organization has no machinery with which to take care of the legislative functions; which cannot be separated from the operations of group organizations, and which become more and more important as the groups become larger, and their common co-operation more necessary.

It is this lack of legislative machinery which has given rise to the labor organizations, the worker attempting to secure through his occupational group the legislative powers which have been denied him in the individual industrial unit with its military form of organization.

## Growth of Industrial Organization

In order to illustrate this fundamental difficulty it is important to consider the growth of the industrial organization since the beginning of the industrial revolution, and the strength and weaknesses which have developed along with that growth.

In the beginning of the industrial revolution, about a century ago, very few establishments maintained over fifty workers; the large majority of them maintained less than ten workers under one roof.

Under these circumstances all questions relating to the condition of work, the hours of work, the value of the labor, and other matters of regulation were easily disposed of by the complete understanding between the members of such a small group and by the endless opportunities for the maintenance of that understanding.

The employer and the worker were very close together socially as well as economically, and the necessity for obedience in operation was accompanied by a confidence and understanding in regulation which made it possible to perform all the functions of the organization with this simple machinery.

As the machinery of production grew in quantity, in size and in skill, it became possible to concentrate in one industrial unit larger and larger groups of workers, following different occupations, and having somewhat different necessities in regulation and agreement.

These larger organizations did not change the system, but simply amplified the operating machinery of industrial government, so that the number of supervisors was

constantly increased, new officials were interposed between the worker and the employer or leader of the industrial unit, and the distance between the worker and his ultimate chief became greater.

This meant that the former understanding which existed between the leader and his employees was destroyed because of the lack of common interest and direct contact. The possibility of discussion did not exist in this larger organization, and the rules and regulations were promulgated by the owners or employers without either understanding or agreement.

In the political organization at the same time these legislative functions had been developed by the use of special machinery until they offered the individual an opportunity to share in the discussions and to agree with the regulations and requirements. In the industrial group, however, no machinery of the kind had been permitted, and very little modification has occurred even up to the present.

The position of the worker depended upon the attitude of his immediate supervisor, and his tenure could be ended by any conflict with his foreman. No matter what hardship a rule or regulation might inflict, there was no review of the matter, and there was no escape from its burdensome obligation. Some of the systems of penalties which obtained even up to 20 years ago are sufficiently indicative of the failure of the operating type of organization to meet the increasing legislative necessities with justice and discernment.

In the last 20 years the demands of the worker and the very necessities of efficient operation have compelled some important modifications in the military type of organization used in industrial work.

It has become usual in many lines of industry for a special department to hire men and to fit them for their work. There are many organizations where a man cannot be fired by his immediate superior until the case has been investigated in some other way. In a number of organizations the employee who is discharged has the right to demand a review of his case before a body composed of men other than the ones interested, while the establishment of the conference system among the heads of various departments suggests the beginning of special machinery for the performance of the legislative functions.

Even from an operative standpoint, however, the practice which has been usual in the development of the industrial organization has neglected to satisfy the demands of efficiency in some important particulars.

#### Knowledge of Human Nature Needed

To maintain the highest productive efficiency per man and to keep up a spirit of contentment, it would seem that some knowledge of human nature would be required of a supervisor; yet it has been customary in all industries to promote the man for his knowledge of the product and not for his knowledge of the producers. It is rare indeed, even to-day, in an examination of industrial organization to find any special attempt to discover the capacity of the prospective supervisor to understand and govern human beings.

These failures have induced a lack of faith in the present type of industrial organization, not only in the minds of the general body of the workers, but in the minds of many of those who must take part in the government of the operations. The failure is apparent even where the reasons for it have not been thought out.

In all operating organizations of the military type as they grow in size there is a distinct tendency to the development of a bureaucracy, so that precedent, custom and usual methods of examination and operation become

paramount. The rule is no longer a means to an end, but an end in itself.

The writer well remembers a case in a large industrial organization where the question of the disposition of a charge from one department to another took about 6 months' time, a voluminous correspondence, and several meetings of the parties concerned before it was adjusted.

The classic illustration of the disposition of a charge of 12 cents not accounted for by a soldier, which kept an array of clerks corresponding, sorting and filing for 3 years, and even came to the attention of several generals, is not without its parallel in the annals of industrial organization.

In both cases trouble arises from the same cause—the tendency for the rule to become paramount and the reason to be lost, in large organizations, where the human contact between one department and another is practically non-existent. On the other hand, it must be admitted that a somewhat greater difficulty confronts the organization which attempts to settle operating questions by means of legislative machinery.

#### Why Co-operative Business Societies Fail

There is a very good reason why co-operative societies engaged in business usually fail. Operating questions are not matters for discussion, but matters for decision and action. They require not co-operative understanding so much as individual authority and responsibility. In a co-operative organization there is grave danger that while the committees debate the business will pass out of existence.

In political matters there is a distinct danger that we shall not see clearly the divergent necessities of the two functions, and that we may turn over to legislative bodies the conduct of great operations, which require an entirely different form of organization.

Under modern conditions of industry, the military form of organization, despite its value as an operating body, has failed to meet the requirements of the case. The discontent of the worker has increased; his interests have been separated from his industrial unit and absorbed by his occupational organization.

His class consciousness has been aroused; his productive capacity has been increased only where he has been provided with additional machinery; and if the recent platforms of labor federation boards in some of the states are any criterion of the general feeling, he is principally concerned with protecting his economic status and demanding guarantees against their employment.

For this reason it is necessary to consider experiments which have been made in other forms of organization, which include attempts to separate the legislative functions of the industrial group from the operating functions of the same body and to discover, if possible, to what extent they offer a basis for the logical and orderly progress of the industrial group as a producing unit.

In the modern industrial unit the principal legislative functions are those relating to wages, hours of labor, conditions of labor, protective regulations, welfare regulations, the government of physical condition, etc. These present a distinct set of problems, where the greatest permanent benefit can be secured only through the fullest measure of understanding and agreement. In many industries they are at present settled or adjusted only through the interference of the outside labor organizations or the outside manufacturers' groups, with the public taking a hand in the matter from time to time.

Thus there is no complete unified industrial organization in the manufacturing unit of to-day, but a division of organizations, completing the separation between the

# The Chemistry of Pickling Baths

Action of the Acid on Metal Below Scale—Effect of Variations in Strength of Bath—Increase in Temperature Accelerates Pickling Action—Organic and Inorganic Materials for Modifying Action of Bath

**P**ICKLING is a process much used in connection with the hot working of iron and steel. Whenever steel is raised to a red heat a layer of oxide scale is formed on it, and this must be removed before the steel can be machined or before it can be painted or otherwise finished. In the pickling process the scale is removed by placing the objects in a bath containing a hot, dilute solution of sulphuric acid.

Sulphuric acid being very essential in the manufacture of munitions, an increasing scarcity has been noticeable for some time, and endeavors have been made to find substitutes for it in certain of its minor applications. One of these is its use in pickling baths. The U. S. Bureau of Mines has recently conducted a research on the practicability of substituting nitre cake for sulphuric acid in these baths and the results are presented and discussed in a paper by E. E. Corbett, chemical engineer of the Bureau, just published, from which we extract the following regarding the action of the acid in the pickling bath.

## Mechanism of the Pickling Action

The free acid in hot, dilute solution attacks the metal very readily, etching it away from beneath the coating of scale and consequently throwing off the particles of oxide from the surface. Iron goes into solution as ferrous sulphate; and the hydrogen which is liberated at the face of the metal is carried rapidly to the surface of the solution, where it escapes into the air with the steam and other gases rising from the pickling bath. These vapors carry out into the room considerable quantities of acid, finely divided particles or drops mechanically entrained, and are a source of constant annoyance to the operatives, as well as a source of *avoidable* expense due to their attack on the metal work and machinery in the building. Various no-gas or foam compounds are in use as a check to this loss and nuisance. They and their action will be referred to later in this report.

## Concentrated Solution Dissolves Scale

When the concentration of acid in the solution is high, both metal and oxide go into solution, the metal dissolving so rapidly and irregularly as to give the remaining sheet or bar an etched, pitted, or acid burned surface. Very dilute acid, however, does not dissolve the oxide appreciably; its chief action is on the sound metal. The ferrous sulphate which results is hydrolyzed, forming free acid and ferrous hydroxide, which, at the surface of the hot solution, is oxidized and thrown into suspension in the nearly neutral solution as hydrated ferric oxide. Its acid constituent, though small in concentration, is free to act on a fresh portion of metal. In virtue of this decomposition of the sulphate, a given quantity of ferrous sulphate should suffice to pickle an indefinite quantity of metal, constantly renewing its acidity as the oxidation of the lower oxide proceeds. Actually, however, a solution equilibrium is soon attained; and though ferrous sulphate is an energetic pickling compound, its action is ultimately poisoned by the products of its decomposition.

## Agitation Facilitates Action

With a fresh solution, in contrast, agitation of the bath which brings the acid-filmed surface of the metal into regular contact with the air and simultaneously renews the surface of the bath, facilitates the oxidation of the hydrolyzed ferrous compound and consequently accelerates the pickling. Hence a regulated jet of heated air, introduced with the steam into the pickling vessel, should serve further to increase the ac-

tivity of the acid through the formation of ferric sulphate, which because of the readiness with which it oxidizes the metal while it simultaneously splits the acid radicle from its own molecule, is even more corrosive than acid in its attack on the sound metal. It is this very corrosiveness and rapidity, however, which make ferric sulphate solutions unsuitable for pickling, for the attack is directed almost exclusively to etching the sound metal without the interpolation of a layer of hydrogen or other protective covering, leaving the scale unaffected where it has not been mechanically sloughed off, and burning the more intensely where the full strength of ferric sulphate is thus localized.

As the quantity of acid required to pickle a metallic mass is a function of the metallic surface, so is the rate of pickling a function of the dissociation of the acid in solution. The dissociation, or pickling energy, is in turn affected by, 1, the temperature; 2, the strength of acid; and 3, the presence of other bodies whose concentration tends to reduce the effective dissociation value of the acid.

1—Thus, if the temperature of the acid solution is raised from normal atmospheric to 170-190 deg. Fahr., the reaction velocity between metal and acid will increase fifty to one hundred fold, or even in higher ratio, depending on other conditions—notably the actual concentration of the acid in solution.

## Proper Acid Strength

2—For the most efficient action in scale removal, combined with minimum attack on sound metal and consequent preservation of gage as well as economy of time in pickling, this acid strength should run between two and four per cent, representing specific gravities of solution between 1.010 and 1.032 before any metal has dissolved. These limits represent maximum acid activity on average light oxide scale, under the most economical working conditions. For heavier, unbroken scales a stronger acidity is demanded; this may run up to seven or eight, and in a few cases to ten per cent. These concentrations are best worked out for the particular problem which necessarily arises from special conditions of working before and after pickling. Here the chief considerable variable is extent of surface, with the correlated danger of unnecessary loss of metal. The attack on light gage material is of necessity more carefully restricted than on heavier stock carrying a similar coating of scale. In machine pickling, furthermore, the strength of acid must be regulated in a certain measure by the time required to unload and charge the cradles.

## Exhaustion of Bath

As the percentage of ferrous sulphate in solution increases, due to decomposition of the acid which is continually added to preserve the pickling energy, the specific gravity and viscosity of the bath tend to rise to a point at which pickling begins markedly to slow down. The beginning of sluggish circulation becomes evident after a specific gravity of 1.17 is reached; the mobility of the acid falls off until at 1.25-1.27 specific gravity, activity at the specified temperature, 170-185 deg. Fahr., is practically at an end. Here the temperature may be raised to 200-205 deg. Fahr. for a short time in order to reduce the free acid to 0.0030 gm. per c.c. of solution, and finally to "kill down" to an essentially neutral ferrous sulphate for copperas recovery.

Two of the conditions treated in the foregoing paragraph, namely, specific gravity and temperature of operation, give

rise only too frequently to sources of waste which cannot be too closely guarded against. A few companies employing excellently regulated, chemically controlled cleaning processes use the pickle liquor until the continuous addition of acid and likewise its continuous utilization have enriched the solution with ferrous sulphate to the saturation point at a moderately high temperature, while the acidity is practically exhausted after "killing down." The aim is to avoid metal and acid waste and also to end with a solution for copperas recovery which will minimize subsequent fuel consumption in evaporating off excess water beyond that concentration required to form the sugar crystals. The processes both in pickling and in sulphate recovery are scientifically controlled and adequately carried out.

#### Causes of Waste

In the majority of instances, however, the copperas is not recovered; hence the density of the waste liquor is largely determined by the length and intensity of the working day. Many works require an acidity determination before the liquor is run off to the sewer. A few, however, do not demand this check on losses; as a result an acid balance between shipping point and pickle room is not kept. Acid is added to dead pickle liquor in order to enliven a heavy, saturated solution, and as might be expected, the action is not noticeably quickened.

It is idle to expect anything but the feeblest action from a bath whose density runs in the neighborhood of 1.25-1.27, regardless of how much acid is added to it. The acid is simply sent to the sewer as waste.

#### Excessive Temperatures Wasteful

Another more subtle source of waste is reached by the excessive temperatures which the majority of works employ at all stages of pickling, whether the solution be new or old, the acid strong or weak. The steam is turned on so as to keep the surface of the bath at a constant seething boil. The slight gain in speed which results from raising the temperature of the solution from 170 deg. Fahr. to boiling is more than offset by the heat wasted in the live steam which passes into the atmosphere uncondensed, carrying out with it to the fan-exhaust system or into the room from 5 per cent to 15 per cent of the effective acid, most of it mechanically entrained.

A temperature of 160-185 deg. Fahr. should not be exceeded except during the "killing down" of dense, heavy solutions. It is a significant fact that the point of maximum solubility of ferrous sulphate lies within this range, and any substantial increase of temperature results simply in unnecessary loss and waste without a compensating gain in speed of cleaning. At superior temperatures the peak of the ferrous sulphate solubility curve is passed, and anhydrous ferrous sulphate separates from the saturated solution.

#### Injurious Effect of Ferrous Sulphate

Above, it has been pointed out that ferrous sulphate, by virtue of its yielding sulphuric acid as a product by hydrolysis or dissociation, and momentarily ferric sulphate by surface oxidation, behaves as an energetic pickling agent—even to the extent of inducing a very undesirable etching and pitting of the metal. Because of this activity it is quite unsuited to general mild operation where the end sought is chemical action which shall remove oxide scale, rust, and siliceous particles of furnace bottom, leaving the surface of metal evenly cleaned, without substantial reduction of gage, and free of discoloring compounds or color patches. In conjunction with sulphuric acid in hot, dilute solution its tendency is to accelerate or at least to maintain the velocity of action of the acid on the metal as long as decomposition products do not disturb the acid equilibrium and limit its mobility.

#### Inhibition, or Moderation of Metal Attack

3—The activity of the acid, then, is directed to attacking selectively and dissolving the sound metal rather than the more resistant oxide or scale; but in well-regulated pickling practice the selective attack is limited, and, indeed, materially redirected and controlled by the use of bodies of a colloidal nature whose influence serves to protect the metal during

scale removal. These bodies are for the most part of vegetable origin, and comprise various wood sugars and gums, and cereal starches, and intermediates occurring in commercial grain milling.

#### Organic Substances Employed

Specifically, the organic substances which have been successfully used for this purpose, in quantities sufficiently small as to give simply a distinct film to the surface of the bath under temperature conditions which moderate the charring of the inhibitor by hot acid solution, are listed below:

Molasses	Fermented yeast
Sugars	Spent tan-bark
Cornstarch	Bran
Peanut meal	Middlings
Quebracho fiber	Rye flour

The inhibitor is usually prepared as a fermented swill or mash which is added to the bath at intervals determined by the rate at which its influence is destroyed by the chemical action of the acid.

Soap-bark and the various foam compounds in use are of an inhibitory nature. The last-named commercial preparations are essentially concentrated sulphite pulp extracts placed on the market as strong solutions or as powders incorporated with ground nitre cake and rock salt.

#### Inorganic Inhibitors

Tin and copper salts are representatives of the inorganic type of semi-colloidal inhibitors; but their action is of inferior consequence and their use restricted because of the cost of adding the bath quantities sufficiently large to exercise a sensible influence, as well as their tendency, undesirable for most purposes, to plate out from solution upon the metallic surface.

The precise chemical mechanism of the inhibitor in solution has not been established; its beneficial action, however, both in limiting surface corrosion of metals, and in reducing the fume nuisance in pickling rooms is beyond question. It is believed, more commonly than logically, that a small quantity of one of these substances, thrown upon the surface of an active solution simply prevents the escape of disagreeable gases by blanketing the bath and absorbing the vapors—this, notwithstanding the difficulty of comprehending how hydrogen may be so blanketed, above a solution whose temperature rises close to the boiling point of water. It is a fact, however, that the surface tension of such a film does prevent to an appreciable degree globules of acid solution from being forced almost explosively into the atmosphere surrounding the vats.

#### Action of the Inhibitors

Nevertheless the main value of the inhibitor, from the pickling viewpoint, lies in the modifying action which it exerts on the tendency of the acid to attack the sound metal rather than the scale; and this moderating influence first shows itself in the comparatively lesser volume of non-condensable gas, chiefly hydrogen, which rises from the surface of the solution. The solution is no longer a system of acid in water, but acid in an emulsion of a starch or sugar with water; hence, in the different pickling medium the acid is carried by an organic vehicle in which its properties are necessarily modified. Similarly, the catalytic accelerating function of the ferrous sulphate in solution is neutralized; its dissociation value is reduced in the new medium, its sensible influence thus rendered comparatively inert.

Other substances than colloids are materially effective as inhibitors or polarizers; sodium sulphate acts in such a capacity, chiefly perhaps in reducing the electrolytic dissociation of the acid and in neutralizing the influence of the ferrous sulphate—possibly by forming with the latter an undissociated, or little-dissociated, double-salt in solution. Its usefulness in pickling is more or less accidental—secondary to the important proposition of utilizing the comparatively large quantity of sulphuric acid which occurs in nitre cake, a by-product in the manufacture of nitric acid, and which is available for metal cleaning as well as for many other chemical purposes.

# Rumpler Two-Seater Biplane

Technical Description of a Late Model German Reconnaissance Machine  
Issued by the British Aircraft Department

**T**HE Rumpler two-seater biplane of the CV type, illustrated herewith, was in use at the beginning of the year, but we believe we are correct in saying that it is now obsolete or fast becoming so. As the type letter C indicates, the machine is designed for reconnaissance work, and as indicated by the V, it is the fifth design of this class produced by the Rumpler works. The information here given concerning its construction and performance is based on an official report on the machine issued by the Aircraft Production (Technical) Department of the British Ministry of Munitions.

The leading dimensions, etc., of the machine are as follows:  
Weight—Empty (including water), 2439 lb.; fully loaded, 3439 lb.

Military load—545 lb.; loading on wings, 9.5 lb. per sq. ft.

Weight per hp.—13.2 lb. Engine, 260-hp. Mercedes.

Capacity—Petrol, 59 gal. Oil, 3 gal. Water, 10 gal.

Endurance—About 4 hr.

Areas—Tail plane, 22 sq. ft.; fin, 4 sq. ft.; elevators, 20.8 sq. ft.; rudder, 6 sq. ft.; upper wings (including ailerons), 217.6 sq. ft.; lower wings, 146 sq. ft.

The capabilities of the machine are indicated in the following figures:

Height .....	10,000 ft.	15,000 ft.
Horizontal flying speed .....	100.5 m.p.h.	87 m.p.h.
Engine speed .....	1510 r.p.m.	1390 r.p.m.

Climb to 10,000 ft.—Time, 16 min. Rate of climb at this height, 400 ft. per min. Engine speed at this height while climbing, 1375 r.p.m.

Greatest height reached during test, 15,300 ft. Time, 38 min. 25 sec. Rate of climb at this height, 125 ft. per min.

Service ceiling (estimated)\* 15,500 ft. Absolute ceiling (estimated), 17,500 ft.

While the longitudinal control by means of the elevators is good and the directional, or rudder, control moderately light

and quite effective, the lateral control obtained from the ailerons is stated to be very heavy and ineffective and to make the machine tiring to fly. It is further stated that the machine is nose heavy and somewhat liable to get into a spin.

## Wings

The wing sections are shown in the general arrangement on page 963, contrasted with the R. A. F. 14 section shown shaded. As usual, the German design exhibits considerable camber. The angle of incidence for the top plane is 2 deg. 40 min. and for the lower 3 deg. The front and rear spars are of spruce and, as shown in Figs. 1 and 2, are made in two parts, which are grooved and tongued and glued together. The ribs are built up of ply-wood and strips, and as usual short false ribs extend from the leading edge to the front spar between the true ribs. Between the spars steel compression tubes are arranged and are braced by piano wire at the wing tips and cable and swaged rods toward the inner end. The trailing edges of the wings are formed of flattened steel tubes to which the ribs are attached by copper rivets. The workmanship displayed on the wing structure is good, and the design and construction appear to give adequate strength. Ailerons are fitted only to the upper wings, a fact which may account for the ineffectiveness of the lateral control, which has already been noted and which is characteristic of nearly all German aeroplanes. The area of each aileron is 15.3 sq. ft.

Rapid assembly and dismantling of the machine is facilitated by the means adopted for attaching the wings to the upper cabane and to the fuselage. Fig. 3 shows the attachment for the upper wings. Each wing is locked by means of a guillotine lever, which is held in the locking position by a pin passing through holes in both levers and holes in the center section. The fixture for the lower wings is illustrated in Fig. 4. It consists of a socket on the fuselage and a ball member on the spar end. The wing is detached by loosening the struts and bracing and lowering the outer end on to the ground. The center section cabane is a welded up structure and is illustrated in Fig. 5.

Photograph of the Rumpler CV biplane

Front and side elevations and plan; also wing sections

The design of the fuselage presents a compromise between the different rival methods of construction. It embraces steel tubes, three-ply wood and wooden longerons and struts braced with piano wire. From the rear of the after cockpit to the tail the fuselage framework is formed of a braced girder of wooden longerons and struts. The forward portion of the framework is composed of a similar wooden structure reinforced with steel tubes formed with forked ends and bolted together. For a distance of about 6 ft. forward from the sternpost the framework is covered with three-ply wood, which thoroughly stiffens up the fuselage at the points where the stresses thrown on it by the tailplanes are likely to be most severely felt. From the forward end of this three-ply covering to a point abreast of the pilot's seat the framework is fabric covered. Thereafter three-ply wood is again used. The arched top of the fuselage is formed partly of three-ply

and partly of aluminum. The bottom is entirely of three-ply. The engine cowling is made of sheet aluminum held in place by means of turn-buttons.

#### Landing Gear

The design of the landing gear follows the usual vee formation, with the upper extremities of the struts placed well apart. The struts are of streamline steel tubing. The front limb is of smaller section than the rear one, and has been additionally faired with wood, obviously as an after thought and not by the manufacturer. At the lower ends, as shown in Fig. 6, the struts are welded together by a bridge piece and joined to the sheet steel streamline sectioned trough within which the axle rests during flight. The landing shocks are taken by steel coil springs, and not, as might be thought from Fig. 6, by rubber cord. Four bracing wires connect the

four upper points of attachment of the struts with the apices of the vees. In Fig. 7 one of the front strut attachment pieces is shown.

The elevators are unbalanced. In the earlier CIV Rumpler machine they were balanced, so that as the longitudinal control of the CV machine is reported to be entirely satisfactory, it would appear that unbalanced elevators have been found all that is desirable. The fin area, in view of the side area, presented in the nose of the machine is regarded as hardly sufficient and the deficiency in this respect is suggested to be the cause of the tendency shown by the machine in flight to get into a spin. The four tail stays are of streamline steel tubing, the lower pair being serrated to remind the mechanics

not to lift the machine or hold it back by grasping these stays. The fabric has not been removed from the fin, rudder or elevators; but it is believed that the framework of these members is formed of welded steel tubing in the usual way. The tail skid is illustrated in Fig. 8. It is of ash, pivoted at its center and sprung at its upper end. The lower end is provided with a sheet steel shoe of the shape shown.

#### Control System

The controls are arranged in an unusual manner, the ordinary transverse rocking shaft for the elevators being dispensed with. The arrangement used is illustrated in Fig. 9. It consists of a longitudinal rocking shaft of steel tubing to

which a coned portion is welded, and on which a double-ended lever for the aileron wires is pinned. The vertical control lever is pivoted within the cone-shaped portion and is attached at its lower end to the cables extending to the upper levers on the elevators. The cables from the lower elevator levers are led round pulleys situated within the end of the longitudinal rocking shaft and are thence taken to the end of the control lever. The aileron cables are led over pulleys into the interior of the lower wings, and so up to the levers of the ailerons on the upper wings. These levers, as usual in German practice, lie in line with the main plane and are accommodated within slots cut in the rear edge thereof. The rocking shaft, shown in Fig. 9, lies somewhat below the level of the fuselage bottom, and is enclosed within a sheet aluminum farling screwed to the fuselage. The rudder bar, Fig. 14, is of welded sheet steel and is provided with rubber sleeves and leather straps to prevent the pilot's feet slipping. No provision is made for adjusting the distance between the bar and the pilot's seat.

The armament consists of a fixed Spandau gun controlled by the pilot and a Parabellum gun mounted on a rotatable ring in the usual way at the observer's cockpit. The pilot's gun is fixed close to the starboard side of the engine and is inaccessible during flight. It is controlled by a thumb lever on the control stick—see Fig. 12—and is fitted with the usual synchronizing gear. An aluminum tray with holes for ten Verrey lights is fixed to the fuselage. Provision is made for fitting a bomb rack, but no rack was found on the captured machine.

The engine is of the 6-cylinder, 260-hp. Mercedes type, but on other Rumpler CV machines a 240-hp. Maybach engine has been found. Both of these engines have been fully described in these pages. The radiator is illustrated in Fig. 10. It is slung, as shown in Fig. 5, from the central cabane structure. Its honeycomb is formed of circular brass tubes expanded at their ends into hexagons, and there sweated together. The total radiating surface is 1.5 sq. ft. The shutters regulating the cooling surface are operated by cables, one passing over the top of the radiator and one exerting a

downward pull and passing beneath. German pilots have reported that these shutters are rarely required except during protracted descents. A mercury thermometer is used to indicate the temperature of the cooling water and is marked in red to show the permissible range, which extends from 60 deg. to 85 deg. C. The radiator is regarded as thoroughly satisfactory, but it must obstruct the pilot's view somewhat.

The oil tank is situated on the port side of the engine and is lagged with a thick covering of felt to preserve the contents at an equable temperature. The main fuel tank has a capacity of 57 U. S. gal. and is arranged to serve as a support for the pilot's seat. An auxiliary tank of 16 gal. capacity is fitted between the two cockpits. Both tanks work under pressure. The initial pressure is obtained by means of hand pumps, of which there is one in each cockpit. Once the engine is started the pressure is maintained from an automatically regulated air pump driven off the engine. The tanks are made of sheet brass and each is provided with a pressure gage on the dashboard. By means of three 3-way cocks the pilot can shut off the fuel entirely, run on either of the tanks separately or on both simultaneously. The engine throttle valve is controlled by the gear shown in Fig. 13. The fact that the Mercedes carbureter is situated at the rear of the engine permits a direct control of the design illustrated to be adopted.

A tachometer working on the centrifugal principle and graduated from 0 to 1600 r.p.m. is driven off the engine crankshaft. It is not illuminated and is not marked to show the normal speed. The propeller has a diameter of 3150 mm. and a pitch of 1830 mm. It is secured to the crankshaft by eight bolts instead of the usual six. The machine is wired internally for wireless and a tapping key is fitted close to the observer's right hand. The rack for the aerial reel and a sheet steel shelf for the wireless dynamo were found in the captured machine, but other wireless details were apparently absent. The machine carried two cameras; one, a particularly large one, being accommodated in the fitting illustrated in Fig. 11, comprising a light octagonal tray *A* suspended from the floor boards by means of elastic shock absorbers.

## Wismach American Gage Blocks

**I**N all high-class manufacturing processes use is now made of gages of one kind or another, including standard gages, limit gages, etc. Standard gages are used for checking up other gages used in the shop. A new set of standard gages, known as the Wismach American gage standard, has recently been placed upon the market by O. Zernickow, 15 Park Row, New York.

These gages come in five different sets. The No. 1 set is adaptable to combinations of 1/10,000 in. and the individual blocks are claimed to be accurate to 1/10,000 in. at 68 deg. F., at which temperature they are standardized. No. 2 set is similar to No. 1, but has not quite the same number of blocks. The No. 4 set gives dimensions in fractions of an inch, and the No. 5 set contains blocks in metric sizes.

These gage standards are made of high-carbon steel in rectangular prism shapes and have highly polished parallel surfaces, the distance between which is marked on the block. Owing to the fact that objects of hard steel are subject to variations in their shape and dimensions for a considerable time after they are completed, the Wismach gage blocks are subjected to a tempering process of long duration. It is stated, however, that this process in no way reduces their hardness. The tempering neutralizes the local strain within the metal and eliminates any further dimensional variations.

These gage standards are not magnetic, and care must be taken not to allow them to become magnetized, as if they are magnetic they will attract small particles of iron and steel, which will adhere to their surfaces and render the surface-to-surface combination impossible. The measuring surfaces are parallel to such a degree that in a proper combination of any number of blocks the units join just as if they were a single solid piece. The combination of two units is effected by sliding one block over the other and applying a little pressure at the same time. The surfaces then remain tightly held together by molecular attraction. Before doing this it is

important, however, to first wipe off any oil or grit which may have collected on the surface of the gage blocks.

Most of the combinations required in practice involving three decimal places can be made up of two to three units, while at most five units are needed for four decimal places. An interesting feature in connection with the gages is that they are self-checking. These blocks will also adhere to each other if only portions of the surfaces are superimposed. There are always several combinations for every total, so that the same total standard can be set up at least twice from one set of gage blocks. In checking, the two combinations are placed between any other two blocks.

Set of Wismach standard gages

# German Piracy of American Trademarks

Advantage Taken of Foreign Laws Giving Right to Exclusive Use of Trademarks Merely Through Registration—Misuse of International Bureau

By Albert E. Parker\*

**T**HE unscrupulous methods followed by German traders prior to the war, in attempting to monopolize foreign markets for their wares, have received considerable emphasis during the past 2 or 3 years by the evidence which has been brought forward from various quarters of the activities of German and Austrian firms in registering well-known American trademarks in foreign countries.

These activities have reached such a climax, and have extended into so many countries that government departments, such as the Bureau of Foreign and Domestic Commerce, have found it necessary to issue warnings calling attention to this practice, and advising American manufacturers against entering into trading relations with different countries before registering their trademarks in such countries; and it is believed the matter is one which will have to be brought up for adjustment on equitable lines at the peace conference.

## Piracy of Trademarks

In June last the Department of Commerce called attention in Commerce Reports to instances of the piracy of trademarks, consisting of the names of well-known American automobiles, motor trucks, pharmaceutical preparations and other articles the sale of which depends largely upon advertising and good will, and cited the case of a single firm applying for registration of the trademarks of six among the best-known American cars.

The report further stated that if registration had been granted thereon it would have been practically equivalent to the acquisition of an exclusive agency for the importation of each of these six cars in one of the most important foreign markets for automobiles, unless the manufacturers were willing to adopt a new trademark for that particular market.

It is not generally appreciated by manufacturers that in many foreign countries the exclusive right to a trademark is acquired by registration, and not, as in the United States, by actual use of the mark upon the goods sold thereunder.

In such countries as Argentine Republic, Bolivia, Chile, Costa Rica, Cuba, Germany, Guatemala, Nicaragua, Norway, Paraguay, Peru, Portugal, Santo Domingo, Serbia, Sweden, Turkey and Venezuela the right to a mark is granted by the registration thereof in such countries, and no consideration is given to the trader whose goods may have been sold thereunder but who has failed to comply with the statutory requirements of the countries concerned, and thereby secure a monopoly of the mark against all others.

## Laxity on Part of Owners

The laws of the United States, England, France, Belgium, Italy and the British colonies, among other foreign countries, provide for recognition of trademark ownership to the first to use the trademark in such coun-

tries, and while this is a reasonable and equitable arrangement it has undoubtedly led to a certain laxity on the part of American and British traders, who have assumed that the laws of foreign countries generally followed their own on this important matter.

A provision exists in the laws of some important foreign countries, including Great Britain and some of the chief British colonies, under which the registration of a trademark becomes conclusive of ownership after a few years from the date of registration, but before suit for an infringement can be brought under such a registration it is generally necessary to establish that the mark is in actual use upon the goods for which protection is claimed, as without such use the alleged infringer could counter claim for cancellation of the trademark on the ground of non-user.

## Benefits of Trademark Conventions

The benefits of conventions providing a simple and economical system of protecting trademarks have been recognized by European countries for many years past, and full advantage has been taken of such conventions by the countries which have adhered thereto, as is instanced by the fact that in the twenty-five years during which the Berne International Trademark Convention has been in operation about 20,000 trademarks have been registered through an international bureau.

The arrangement of this bureau, established at Berne, Switzerland, in 1893, provides for the registration of trademarks in thirteen countries by the simple procedure of paying a fee of 100 francs to the central bureau, which then notifies all the trademark offices of the other countries of the depositing of the trademark, and these thirteen offices register the mark, while the courts give the same protection thereto as would be afforded under separate registrations made in those offices.

The countries which are parties to this Berne Convention are as follows: Austria, Belgium, Brazil, Cuba, Spain, France, Hungary, Italy, Mexico, Holland, Portugal, Switzerland and Tunis.

It will be noted that Germany is not a party to this convention, but Austrian firms, and German firms established in one of the convention countries, have not failed to take undue advantage of the arrangement to the serious detriment of American traders.

## Tire Trademarks Stolen

Before the United States entered the war the trademarks of practically all the leading tires made and sold in the United States were registered under this international convention by one Richard Mittler of Vienna, Austria. By paying to this Central Bureau in Berne, Switzerland, the small sum of \$180, Mittler was able to protect in his own name the marks of nine of the best-known American tires in the thirteen countries of the convention, and in so far as those countries give protection to the first to register the trademark, he has acquired exclusive rights to such trademarks, unless the rightful owners had previously taken the precaution to register the same in their own names in those countries.

\*Mr. Parker is a member of the firm of Marks & Clerk and is a recognized authority on the subject of International Trademark Law.—EDITOR.

Mittler is now in the position where the American traders who failed to previously register the mark must negotiate with him to buy back their trademarks, or else change the name of the goods for that particular market.

Many other instances of the use of this International Bureau by Austrian firms, or by German firms located in one of the countries of the convention, can be cited.

As the United States is not a member of the Berne Convention, American manufacturers cannot take advantage of the simple procedure available to citizens of the countries which have adhered to the convention, and it is necessary, therefore, for trademarks to be separately registered in the thirteen countries in order to fully protect the American trader.

### South American and Other Piracy

A leading attorney in the Argentine Republic is now compiling a complete list of applications by Germans to register well-known American trademarks, of which scores of instances can be cited, so that proper action can be taken to recover these trademarks, either through the State Department by diplomatic action in the Argentine, or through such other government bureau as may be found advisable.

Many American manufacturers are at present debarred from using their trademarks in Scandinavian countries by reason of the fact that registrations have been secured thereon in the names of residents of those countries. In some of these cases the marks have been covered by agents of the American manufacturers—in the names, however, of the agents, who have thereby secured a monopoly thereon. It will readily be seen how an unscrupulous agent can exercise this monopoly to the serious detriment of the American trader.

### The Buenos Aires Convention

The International Convention of Buenos Aires, which was signed in 1910, and of which the United States is a member, will provide a simple procedure, similar to that available under the Berne Convention for the protection of trademarks on the American continent. This Buenos Aires Convention has been ratified by a sufficient number of the northern group of countries to enable it to be brought into operation, ratifications having been filed with the Cuban Government by the following countries, in addition to the United States: Costa Rica, Cuba, Dominican Republic, Guatemala, Honduras, Nicaragua and Panama.

The Cuban Government has appointed a director to take charge of the bureau, and has appropriated \$25,000 toward the cost of erecting a permanent home, and has authorized the president to give a suitable site in the city of Havana for the purpose.

Rules have been drafted for operating under the convention, and these have been submitted to the officials in the countries above referred to, so that it is expected that applications for registration at this International Bureau, covering the eight countries of the northern group which have ratified the same, may be accepted for filing and for communication to the other countries in a few months' time.

The United States Congress has had under consideration a new bill for giving effect to the convention in the United States, and this bill has passed the Senate and is now before the House for action. Congress has been requested to appropriate such proper sum as will adequately represent the quota of the United States toward the cost of maintaining the bureau as well as the cost of erecting its permanent home.

It will be noted that Mexico, Salvador and Haiti,

among the northern group of countries, have not ratified the convention, so that separate protection has to be obtained in those countries.

### Southern Group—Ratifications Incomplete

It should be clearly understood that for the present no possibility exists of securing any benefit, so far as the South American countries are concerned, from the Buenos Aires Treaty. A sufficient number of countries in that group has not yet ratified the convention to bring it into operation, and it still requires two further countries to send in their ratifications before arrangements for the opening of the office at Rio de Janeiro can be made. In view of the fact that the piracy of trademarks, particularly by enemy aliens, is most common in South America, and especially in the Argentine Republic, it is essential for the full protection of trademarks there that separate applications be filed to register the same as before.

One of the great difficulties militating against ratification by the Argentine Republic is that this will require recognition of trademark rights by the actual user, instead of by the first to register, as at present is the law of that republic.

In the past it has been a common practice for so-called agents of United States traders to enter into an agreement to represent the United States manufacturer, and to obtain a shipment of goods bearing the trademark, which in the meantime the Argentine agent has registered in his own name in that republic, and when the goods reach him these are confiscated, and unless new arrangements are made with such agent to his advantage the trader in the United States not only loses his goods, but also his trademark, and has to adopt an entirely new brand in that country.

It will readily be appreciated that as the courts of the Argentine Republic encourage practices of this kind by rendering decisions in favor of the first to register the trademark, officials there are not willing to ratify the convention of 1910.

### Under Webb Export Bill

The act known as the Webb law, passed by Congress in 1917, legalizing the formation of associations or trusts for the purpose of engaging in export trade, has provided an excellent means of building up foreign markets if proper advantage is taken of the measure, and it is believed that more attention should be given to this important piece of legislation and efforts be made by groups of the leading traders in different lines of industry to form associations for securing the full benefits thereof. Such associations, when properly organized, could undoubtedly exert considerable influence on the officers of commercial organizations in South American countries to secure either ratification of the convention, so as to bring it into operation there, or changes in the laws of those countries which would recognize the ownership of trademark rights based on the prior use of a trademark.

If the operations of the trademark bureau to be established at Havana indicate that the international registration of trademarks is advantageous to the members of the union, undoubtedly pressure will be brought to bear on the Government to seek admission to the Berne International Convention above referred to, so that there will gradually be built up a system which will tend to the eventual establishment of a single office for the registration and publishing of trademark rights in all countries of the world.

The proposal for the designing and adoption of a national trademark, for which a bill was introduced in

# Official History of Aircraft Production

## Objects, Problems, Production and Results of Entire Air Program Laid Bare in Conjunction with Complete Exhibition of Planes and Equipment

WASHINGTON, Nov. 27.—The first definite and comprehensive official reply to past criticisms of military air activities was made here to-day when complete information about production of engines and planes was disclosed at the War Department by Air Service officers in the presence of Secretary Baker. The information was given in connection with an exhibition of a DeHaviland 4 plane partially stripped and exhibited with all its accessories and parts in a room at the State, War and Navy Building.

The front half of the fuselage was shown equipped with four machine guns.

Primarily, the history of engines and planes related by Lt. H. H. Emmons, U. S. N., R. F., A. S. A. P. in charge of engine production, developed that the original plans of the Aircraft Production Board headed by Howard E. Coffin have practically been followed completely from the beginning to the end of the war; that only two changes were made in the original design of the Liberty engine as laid down in May, 1917, despite all rumors to the contrary; that J. G. Vincent, vice-president in charge of engineering of the Packard Motor Co., and E. J. Hall, Hall-Scott company, were the actual designers of the Liberty engine; that in October of this year the United States turned out more engines than the combined Allied air factories produced in any one month during the war, and by April, 1919, the United States would have produced 10,000 Liberty engines a month.

The original contracts for 22,500 Liberty 12 engines, said Lieutenant Emmons, had been increased to 51,100 exclusive of contracts also placed for 44,893 other airplane engines, including 10,000 Hispano-Suiza 300-hp. engines, 8000 eight-cylinder Liberty engines, and rotary

and other engines. The production up to the signing of the armistice was 31,814 engines, of which 15,131 were Liberty 12s.

In October 5603 engines were turned out with a program calling for 8000 in January, 1919, and 10,000 a month for the following 4 months.

In contrasting our production with that of the foreign countries Lieutenant Emmons stated that in August, American production of Liberty 12s totaled 3850, while

Great Britain producing the Rolls-Royce—the only engine comparable to the Liberty—turned out only 59 per week.

Twelve thousand two hundred eighty-five airplanes, including both training and service planes, were produced up to the time of the armistice, including 3103 service planes for the expeditionary forces. In addition 700 kite balloons had been produced.

The cause for the failure of the Bristol was also explained in the discussions of the Liberty engine changes. These changes were due, it was said, to design, increase of power and manufacturing limits. The only design changes made were in the lubrication system, which was changed from scupper feed

to the forced feed, and an alteration in a part of the connecting-rod to allow sufficient play.

The power was increased twice in response to orders from the A. E. F., first from 330 hp. to 375 hp. and again to 440 hp. at the same time necessitating an increase in weight from 785 lb. to 860 lb.

The manufacturing limits were changed only in so far as this is a common practice in all production. The increase in weight from 785 lb. to 860 lb. may explain the Bristol failure.

Col. E. V. Clarke who selected the Bristol plane for the

### Salient Features of Aircraft History

1—Original Aircraft Production Board plans found correct and successful.

2—Official recognition given to Jesse G. Vincent and E. H. Hall for the design of the Liberty airplane engine.

3—Only two changes made in the original designs of the Liberty airplane engine.

4—Liberty engine production over 5000 in October, 1918.

5—Liberty engine production would have reached 10,000 a month in April, 1919, if the war continued.

6—More than 95,000 airplane engines on order at the signing of the armistice.

7—More than 31,000 training and combat engines delivered prior to November 1.

American program testified before the Senate Committee that his understanding of the Liberty engine weight was under 800 lb.

A committee composed of experienced production executives in the automobile industry, said Lieutenant Emmons, worked directly with the production section of the Air Service and included H. M. Leland, Lincoln Motors Co., C. Harold Wills, Ford Motor Co., and Messrs. Bell and Roberts of the Packard Motor Car Co.

The exhibition included practical demonstrations of the accessories used on the DeHaviland 4 with the most remarkable exhibit that of the flexibility of the two Lewis machine guns used by the observer. These guns weighing several hundred pounds are so arranged on a mounting as to allow firing both with one hand in any direction except directly below the plane.

Compasses of a type said to be much superior to the Allied compasses were being produced at the rate of 500 per week. A photographic machine exhibited is so constructed that it contains a long roll of film capable of taking 100 photographs in a row each 9 in. wide which when joined make a complete mosaic chart of the territory photographed.

Following are the complete statements made, the first a general introduction by Col. L. P. Ayres, General Staff, the history of aviation engine production by Lieut. H. H. Emmons and the descriptions of the manufacture of accessories by various officers:

"The Bureau of Aircraft Production is charged with the design, purchase, production and inspection of all material special to the Air Service," said Col. L. P. Ayres.

"There have been produced in this country during the period of the present emergency in excess of 12,000 airplanes, 30,000 aviation motors and 700 kite balloons, together with a vast variety and quantity of accessories therefor.

"In arranging this exhibit it was evidently impossible to illustrate all of the products involved. The exhibit, therefore, is concentrated on the DeHaviland 4 plane, which is an observation machine of advanced type, and is the American-built plane which has been extensively used over the front in France.

"The front half of the fuselage shown is one of over 500 machines lying at port awaiting shipment overseas when the armistice was declared; it is a regular stock machine and is in no way especially prepared for this exhibition.

"The accessories shown around the room are all parts of the equipment of the same DeHaviland 4 plane. At no time are all of these accessories installed on the plane at the same time, the particular installation depending on the service required. Nevertheless, all of the accessories must be furnished, and the machine must be designed to take each and every one of these accessories when required.

"In the production of airplanes, the limit has always been the possibility of engine production. Consideration of the vast investment in factory and machine tools, and the extremely high character of the workmen required makes this plain.

"It is felt that the second limiting point lies in the accessories, including instruments, armament, bombing equipment, radio equipment, photographic equipment, oxygen apparatus and the special clothing and personal

## AIRPLANES MANUFACTURED AND SHIPPED

Service Planes..	3103	717	155	3975
Total .....	3103	8887	295	12,285

equipment of the aviator.

"The actual construction of the airplane is less difficult, as the investment in machinery and tools is much less, and the labor involved relatively less skilled.

"The special raw materials for airplanes have involved vast industrial operations, examples of which follow:

"It fell to the United States to supply spruce for the entire air program of the Allies and the United States. In October, 1917, these requirements were 5,000,000 ft. per month, with only 2,500,000 ft. per month being produced. In October, 1918, the requirements were 20,000,000 ft. per month with over 25,000,000 ft. being produced.

"These operations involved 30,000 men in the Northwest. It should be borne in mind that lumber actually usable in the airplanes is a relatively small percentage of even the best logs.

"Early in the war, it was evident that the Irish supply of linen would fail. Cotton fabric for airplane use was developed in this country and at the time of the signing of the armistice, about 2500 looms were producing about 1,200,000 yd. per month. There had been delivered up to that date a total of over 13,000,000 yd. of airplane fabric.

"The balloon cloth is of finer weave and 3200 looms were required to produce about 720,000 yd. per month."

In his outline of the history of aviation engine production Lieut. H. H. Emmons, U. S. N., R. F., A. S. A. P., Chief of the Engine Production Department, said:

"At about the time of the declaration of war, Mr. Coffin, and soon thereafter Mr. Deeds, were called upon to organize the production of aviation equipment. Naturally, the first point to be determined was what was to be produced. Limited to the engines, it became clear that three courses were open to them:

"1—To send a commission of experts abroad to study the engines used by the Allies.

"2—To encourage production in this country of such suitable foreign engines as had already been put in production in the United States.

"3—To develop a suitable engine from the talent and facilities available in this country in automobile and allied industries.

"Action was taken along each of these three lines.

"A commission, comprising Major Howard C. Marmon, Lieut. Col. V. E. Clarke and others, was sent abroad and made extensive investigation. The result of this appeared to be that the two best high-powered foreign engines were the Rolls-Royce and Lorain Dietrich. The Rolls-Royce does not adapt itself to American methods of manufacture and the Lorain Dietrich was not at that time completely demonstrated or accepted.

"In the United States the General Vehicle Co. was attempting, in a very small way for the Allies, to produce the Gnome 110-hp. rotary engine. Production, however, had not yet started, and facilities and talent for the production of a rotary engine did not exist in this country.

"The Wright-Martin Aircraft Corp. was beginning in a small way the production of Hispano-Suiza 150-hp. engines for the Allies. Production had not yet started and the power of this engine was so small that it was apparent that it would soon be obsolete for fighting purposes.

"Both companies, however, were assured of business

(Continued on page 987)

# Cultivating Japanese Automotive Field

## PART III

### Types of Automobiles Desired—Equipment and Finish—Japan Ambitious to Build Cars—Experimental Work Being Undertaken—Body Building Developed

By Tom O. Jones\*

**T**HE general principles of motor-car construction prevailing in America meet the requirements of Japan. There are, however, some modifications that would increase business in Japan and possibly in other export fields. A car with a comparatively short wheelbase, a small, high-speed engine, low rear axle, gear reduction, and a chassis that will permit attachment of a heavy limousine body, should prove popular. The price need not be held extremely low, for it is the type of car that would appeal to the wealthier Japanese, as meeting his desire for a car that would afford ample body room and at the same time be small enough to be handled easily in the narrow city streets. Possibly the reason higher-priced American cars have not become more popular in Japan is due as much as anything else to the American tendency to lengthen the wheelbase and build a generally bigger car, harder to handle on sharp turns.

The proposal of such a small car met with general approval from every dealer to whom the subject was broached. It is simply a case for American manufacturers to figure out whether the building of such a car in small quantities would be a financial success. It should be borne in mind, of course, that the business would be for chassis only, with the body built in Japan, a condition made necessary by high shipping costs. From this it may be concluded that the small car generally will be the most suited and acceptable for the market, either in the complete car or chassis. Why the closed car is more greatly in favor in Tokyo is explained by the fact that with the limousine construction the driver is separated from his passenger. Moreover, in the summer the capital is dusty, and a passenger in an open car is subjected to clouds of dust. The heat of an inclosed car, even without the least ventilation, is preferable to this dust. As the American woman has had much influence in motor-car construction, so may her Japanese sister be credited for the preference for

closed cars. Japanese women do not wear hats, and with hair daintily combed there is opportunity for tragedy if a wind storm strikes the fair occupants of an open car.

Although closed cars are undeniably the preference of those able to afford them, it must not be concluded that open cars have no field. They meet the demand for country travel, for renting service, and are largely used by foreigners. The American manufacturer will find his trade about equally divided between chassis and complete open cars.

The following details of design preferred in chassis construction reveal how little special engineering is required to meet the demand for Japan in a mechanical way.

#### Mechanical Features

**Engines.**—Generally, the preference is for block engines, either four or six-cylinder type. There is evidently no preference for overhead valve or L-head construction, but the engine must be serviceable, for it is in its construction, repair and adjustment that the

**J**APAN prefers chassis with short wheelbases owing to narrow streets and sharp turns.

Enclosed bodies are popular owing to prevalent dust and also to the desire to separate the driver from the passengers.

Little special engineering is required to meet the general demands of Japan in a mechanical way. Local repairmen are not expert on engine repairs.

Although in Japan the driver keeps to the left side of the road there is no definite demand for right-side steering. However, it is preferred and, though not essential, will help sales.

Japanese mechanic is at a loss more than in any other part of the car. Eight-cylinder engines are meeting with favor. There are at the present time less than half a dozen twelve-cylinder cars in Japan, but doubtless this is due to the size of the cars rather than to any objection to an engine with this number of cylinders. The sixteen-valve type is at present unknown in Japan, although six sample cars with engines of this type are now on the way to the biggest car-selling company in the Empire. The ideal engine for Japan is an economical, high-speed, four or six, in accordance with car size and weight.

**Transmission.**—A three-speed gearset will meet every requirement for Japan. A four speed is practically useless, for there is hardly any place where extreme speed can be utilized. The location of the gearbox is unimportant, with the possible exception that the transmission in unit with the power plant has preference over location on the rear axle.

**Clutch.**—On this point there is nothing that requires deviation from general practice. Either type is satisfactory, and will cause no prejudice either for or against the car in the mind of the buyer.

**Rear Axle.**—Little discussion as to the comparative merits of live or dead axles is heard in Japan, but there

\*EDITOR'S NOTE—Mr. Jones was formerly with the J. B. Crockett Co., New York, and was given a special appointment by the Bureau of Foreign and Domestic Commerce to investigate automotive conditions in Japan, China, the Philippines and Hawaii. This story is taken from the advance proof sheets of Mr. Jones' report to his departments. Part IV will deal with Japanese repair facilities, shipping regulations, duties, etc.

is a preference, and the sale of a car will be aided by a full-floating type of construction.

**Brakes.**—No part of the car construction is more vital than the braking system. The importance of powerful brakes is impressed on one continually. The regulations of Tokyo provide that "every automobile shall be equipped with two brakes, one working on a drum fixed on the wheel or axle, the other working on the other parts of the machinery," while the Yokohama regulations provide that "two brakes shall be provided on each automobile, one being applied to axles, wheels, or hubs, to enable the car to stop immediately upon application, and the other to prevent the car from backing. Both of the brakes shall be arranged so as to automatically stop the car and also regulate the speed." These clauses are, of course, not lived up to absolutely. The general American application of brakes to rear wheel drums is passed by the inspectors. It is well-nigh a crime to send a car into Japan unless its braking system is efficient, as the congested traffic conditions demand the constant application of brakes. The brakes must be relined and adjusted frequently, and adjustments, therefore, should be as accessible as possible.

**Other mechanical details.**—Strange as it may seem, with road rules the opposite of those in America, no great demand is made for right-side drive. It is preferred, and, while not absolutely essential, will help sales. Battery ignition is well established, and the magneto at the present time does not have the preference it did a year or two ago, although its fitting still has a favorable effect. Carburetors should have as few adjustments as compatible with efficient operation.

#### Equipment and Finish

Standard equipment, such as top, windshield, speedometer, lights, etc., give everything the Japanese require. Details requiring care and adjustment meet with disfavor rather than otherwise. Some of the requirements upon which there are differences in building for export trade are set forth below:

**Speedometer.**—Registration should be in miles, as the British standard is used throughout the country in measuring distances.

**Horn.**—The ordinary equipment may be furnished. It is probable that the old-fashioned bulb horn will be fitted when the car is put in service, but these are now made in Japan, and will be obtained by the dealer. The bulb type seems to be the recognized automobile warning signal in Japan, and its use is alternated with that of the newer types.

**Tires.**—Clincher types are most easily obtained in Japan, but straight-side types may be secured through American companies. The one tire factory now established in the Empire is building clincher tires exclusively, but seeing the probability that in the future the straight-side tires will be demanded, has equipment ready to build this style on short notice. Under present conditions, clincher tires assist in selling the car. Most dealers in Japan desire cars fitted with clincher rims and shipped without tires.

In style and finish, as little change from our common practice will be necessary as in mechanical construction, but the following points should have attention:

**Color.**—In open cars, any of the standard body colors, such as blue, gray, green and brown, will meet requirements, with lighter colors having the preference.

**Tops.**—Black tops will meet the demand. While no dealer interviewed indicated any decided preference for khaki-colored material, an option of either black or khaki is an added inducement. The climate generally does not go to extremes of hot or cold, therefore the mate-

rials used in standard production at home will meet every requirement.

**Upholstery.**—In any car selling above \$1,000 (American list price) the upholstery should be of leather. On cheaper cars imitation or substitute fabrics will fulfill the needs, but when it comes to buying an expensive car—and it must be borne in mind that the selling price in Japan will be in the neighborhood of twice the American list price—the Japanese buyer is earnest in his desire for real leather. All closed bodies are finished in whipcord, a light gray mixture having the preference, with silk window curtains to match.

**Metal Trimmings.**—Nickel-plated finishings are highly in favor. Most of the cars used in Japan are driven within only a few miles of the sea. There are some instances of rust absolutely spoiling the appearance of a car. If black japanned finish is used on any parts the enamel should be heavy, and baked hard, to withstand the elements.

**Seating Arrangement.**—The standard American bodies meet all requirements in Japan. It should be remembered that the Japanese are generally a small people, so that in bodies which in America we considered the limit in smallness for five persons it is not uncommon to see two extra seats added to make the vehicle of seven-passenger capacity, and every one seems to be comfortable. Within the past year the four-passenger cloverleaf type of roadster has become popular, practically every car of this type being sold immediately on arrival. These sales were found to be almost evenly divided between Japanese and foreigners. The fact that sales of this model had been made to Japanese seemed rather in contradiction to the statement that the Japanese wanted to be kept well removed from the driver.

Japan is ambitious to build motor vehicles. The desire to enter the construction industry has become instilled in the minds of men of not less than five or six organizations, either operating now in different lines of industry or to be formed for the purpose of building cars. The plans in every case are still embryonic.

#### Motor-Car Manufacturing in Japan

As an impetus to the building up of a motor-manufacturing industry, the Japanese Government has since the first of this year instituted a system of subsidies, whereby all home-built motor trucks carry a bonus of \$1,000 and foreign-built trucks \$500. This is advanced by the Government at time of purchase and is followed by \$150 annually for upkeep. This subsidy will be paid for vehicles of at least 1 ton capacity originally built for commercial purposes and will not apply to converted passenger cars or vehicles developed by attachments to chassis. The idea is, of course, to apply the subsidy only to vehicles that will be of immediate and satisfactory service to the army if required. These vehicles are subject to military requisition.

The main difficulty in any building to date seems to be that no definite decision can be reached as to the type of car that should be built. The general impression is that a low-priced small car is the most suitable and the one offering the greatest opportunities. In Japan, as everywhere else, there is room for more than one type of passenger car, and probably all cars which may be built in Japan will be small, leaving the field for larger cars to the American and European manufacturers, mainly on a basis of chassis importation with Japanese-built bodies. The delay in preparing drawings may be accounted for by the fact that the Japanese companies plan to model their cars after typical small American cars, that is, those that sell in America for \$1,000 or less.

Canada .....	One Year, 5.00
Foreign Countries .....	One Year, 6.00

To Subscribers—Do not send money by ordinary mail. Remit by Draft, Post-Office or Express Money Order or Register your letter.

### HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Standardization of Brake-Shaft Bushings

THERE has been a very apparent slow-up in the standardization work of the Society of Automotive Engineers of late, which is perhaps natural in view of the fact that a very large percentage of firms in the automotive industry were engaged on Government work and the various classes of equipment required by the Government had been pretty well standardized. However, now that the thoughts of all are again turning to peace-time production new opportunities will be afforded the Standards Committee to serve the industry in standardizing parts of automotive machinery that are ripe for such procedure.

For some time there has been an increasing use of oilless bushings on brake shafts, that is, the shafts carrying the cams or levers which serve to expand or contract the brake shoes or bands. Oilless bushings on these shafts offer a material advantage in that they obviate the need of refilling grease cups

in these relatively inaccessible positions and largely eliminate the wear that occurs if no provisions for lubrication are made.

The manufacture of bushings for this particular purpose has been hampered so far in that the lengths and diameters differed on every car. There should be no difficulty in making three sizes of bushings serve all requirements in passenger car and truck work, and we believe that the Standards Committee would do a valuable service to the whole industry if it were to take this matter up for consideration and formulate standards as soon as possible.

## The Outlook in the Tractor Industry

UNDER the curtailment regulation in respect to steel for tractor manufacturers, which went into effect on October 1 last, the scale of operation of each tractor firm for the coming year was closely limited. No factory which had any appreciable production last year would have been able to exceed 75 per cent of this production the coming year, and through the operation of the priorities system many would not have obtained enough material for even this reduced volume of output. With the ending of the war all these artificial restrictions of tractor production will be removed. The only limit on the total output will be the capacity of the market, or its estimated capacity, to absorb tractors, and as to the distribution of this output between different plants, it will be entirely a matter of free competition.

During the past year the demand for tractors considerably exceeded the production. This does not mean that every firm in the industry could have sold many more tractors than it produced, yet it is a fact that most of the well-established concerns were unable to meet the demands made upon them. This was especially noticeable among implement firms with an extensive distributing organization and only limited tractor manufacturing facilities.

There were three factors which helped to increase the demand for farm tractors last year. One was the unprecedented demand for farm produce and the resulting high prices for same. The next was the scarcity of farm labor, which was due to the draft and to the luring away of farm-help to munitions plants. The third factor was the marked improvement made in tractor design and construction during the past couple of years.

Of these three factors, the first and last at least will continue to operate the coming year. From all reports there will be a greater scarcity of food products than at any time during the war. Hence farmers will continue to receive good prices for their produce and will have every inducement to cultivate every available acre. Just how the farm labor situation will shape itself it is difficult to foretell. There will undoubtedly be a certain relief as the Army is demobilized and munitions factories are closed. But wages are not likely to come down very much for some time to come, and it will therefore

be to the farmer's advantage to save man power by adopting the most modern farm equipment. With a good three-plow tractor outfit one man can do at least twice as much plowing in a day as with a horse-drawn two-bottom plow, hence the item of labor cost in plowing is cut in half by the use of the tractor.

### Intensified Engineering Development Imperative

What is most necessary in order to keep the demand for tractors on the increase is continued, intensified engineering development. The tractor must be improved both as to its operating efficiency, so as to reduce the amount of fuel and oil consumed per acre plowed, and as to its resistance to wear and depreciation. At the present time an almost insignificant proportion of the farms of the country are equipped with tractors. With millions of farms in the country the possibilities are enormous. But before the farmers as a class can be induced to discard their horses and adopt the tractor instead, they must be convinced that the change will result to their economic advantage. Practically all conditions of farm operation have recently changed in a way favorable to the tractor. The high wages of farm labor, the high cost of horse feed and the need of devoting more of the acreage devoted to raising it to raising human food combine to make the outlook for the tractor more encouraging than at any time in the past.

## Commercialism in the Wrong Place

IT is probably impossible to carry through such a gigantic task as that which was involved in our air program without making serious mistakes. Now that the war is won and the program as a whole has proven successful it may seem malapropos to harp on blunders relating to details. Yet it must be remembered that there are many things which could not be mentioned in the public prints before, so that if they are worth discussing, now is the proper time to take them up.

We have recently had a chance to look through a book of instructions for the installation, inspection and maintenance of the Liberty aircraft engine, issued by the Equipment Division of the Signal Corps. One chapter of this book, after describing the battery ignition system specially designed for this engine, enumerates a list of "advantages which this type of ignition presents over the magneto system."

Now, it is difficult to see how a knowledge of the advantages of the ignition system used, as compared with a rival system, will help the mechanic in "installing, inspecting and maintaining" the system used. The section referred to is nothing more or less than an enumeration of sales arguments or talking points, which has no proper place in an instruction book. What makes things worse is that some of the statements made are absolutely misleading, if not untrue. Thus, it is given as one of the advantages

of the Liberty system over the magneto system that the distributor heads of the former "run at slow speed (one-half crankshaft speed), hence the wear will be slight." Now, the distributor of a magneto, the same as that of a battery system, runs at one-half crankshaft speed, if the system is for a four-cycle engine like the Liberty.

Another advantage of the Liberty ignition system over the magneto system is said to be that the spark of the former "is hot and of short duration," from which it may be inferred that that of the latter is cold and long drawn out. It is very much to be doubted whether anybody ever measured the temperature of a spark and is in position to say that one spark is hotter than another.

This, however, is only by the way. The point is that the inclusion of such matter in a Government publication for the instruction of mechanics is an indiscretion of the worst sort, and on reading it one begins to understand the rancorous feeling that has been aroused in sections of the ignition industry by some of the things that have been done by people connected with the aircraft department.

## Maintain Americanism

NOW that the war is practically over, it is to be hoped that the marked impetus given to the "Americanization" movement will not be allowed to perish in the struggle of commercialism. If this war has taught the country anything, it is that our people must not only be citizens, but they must also be Americans. The English language should be as nearly universal in this country as it is possible to make it and we must do everything in our power to avoid the formation of virtual foreign colonies in our midst.

The Germans were highly indignant because the so-called German-Americans did not prove solidly loyal to the Fatherland. They would have been spared this disappointment and we would have been spared a great amount of trouble with a larger element than was comfortable, if such a thing as organized hyphenism had never been permitted to grow.

### American Workmen Should Be Given Preference

In our shops, preference should be given Americans. The emigrant should be encouraged to take out his papers and everything that can be consistently done to make him an educated, English-speaking citizen should be done. This will not only be doing a great work for the country, but it will also be making for a more efficient shop. The public school is working on the next generation. The shop works with this generation as well as the next.

Small shops cannot go as far in this as larger shops can. Here the work can be taken up collectively, through the agency of the Board of Commerce or some similar community organization. It is one of the most important situations which confront the nation to-day, and to do your bit in this in peace times is just as important as it was to have done your bit when war was here.

## Government Should Let Business Set Reconstruction Pace

**Five Thousand Delegates at Atlantic City Congress Enthusiastically Endorse the Principle That Readjustment of Commercial Activities Is a Function of Business and That Government Should Follow Business, Not Lead It, in Its Task**

ATLANTIC CITY, N. J., Dec. 4—Special Telegram—More than 5000 delegates representing the foremost business interests of the United States to-day vigorously applauded the principle that the readjustment of business policies and activities is logically a function of business and that the Government should follow business and not lead it in the task. The convention, which is a reconstruction conference of three hundred and eighty-one war service committees, representing as many industries, formally opened to-day under the auspices of the Chamber of Commerce of the United States. The meetings are being held at Young's Million Dollar Pier, and the initial gathering, which heard such eminent authorities on business as Charles M. Schwab, Secretary of Commerce William C. Redfield, and Harry A. Wheeler, president of the United States Chamber of Commerce, packed the great hall to capacity.

The convention undoubtedly is the most important gathering of its kind that has ever been held and it is certain that the results of the deliberations of the five thousand delegates which will be made public in a series of resolutions at the last of the session on Friday will have a profound effect in guiding and shaping the reconstruction and readjustment policies of the business world.

### Comprehensive Road Program Favored

The economic importance of an uninterrupted policy with regard to public works and particularly in the building and maintenance of national highways is one of sustaining interest to the convention. The hearty applause which greeted both Charles M. Schwab and Secretary Redfield when they separately advocated

the necessity of a comprehensive road program in order that the fullest possible use may be made of highway transportation leaves no room for doubt regarding the sentiment of the gathering on this point. Individual recommendations to this effect have been adopted by nearly every separate war service committee.

And at a meeting of the War Service Committee on Highways a resolution was adopted strongly urging "the immediate creation of a separate and distinct Federal Highways Commission, whose duties it shall be to construct and maintain a system of national highways and that appropriations be made therefor." At the meeting of the War Service Committee of the automobile industry a similar sentiment was apparent, and the members went on record as favoring a continued road program to facilitate and stimulate highway transportation.

### Advocates Commission Be Sent to Paris

Harry A. Wheeler touched a responsive chord at the opening session to-day when he advocated that a commission of business men be sent to France to be available for consultation in the solution of such problems affecting American business as may be expected to come before the peace conference.

"Counsel can hardly be taken except where minds meet and personalities come in contact with each other. The counsel of statistics cannot adequately represent American business," said Wheeler. "Since in questions of economic reconstruction other nations will undoubtedly be adequately represented with the most expert support that can be marshalled, it is for you to determine whether you regard the matter of sufficient importance to advocate the appointment of a commission whose continuous presence in Paris will provide like representation on behalf of American industry."

Touching on the matter of war con-

tracts, Wheeler advocated a liberal policy on the part of the Government in cancellations. "There must be," he said, "a willingness to retain possession of the materials owned and controlled, releasing them only so fast as the market can readily absorb these commodities without breaking prices to an unwarranted extent or stopping production during the period required to digest Government controlled stocks.

"It is vital, however, that such adjustments be made as far as possible before those representatives of the Government who placed the contracts have returned to their private concerns, as only these have knowledge of the circumstances under which the work was undertaken, and who have some sympathetic consideration for the difficulties which confront a converted plant in the reconversion to its normal uses. No substitute adjusting medium can ever accurately and justly determine the measure of damage to plant, or the true value of materials bought solely for other purposes at anything like their invoice cost."

A similar feeling prevailed at the meeting of the War Service Committee of the automobile industry. Here it was reiterated that it was manifestly unfair to subject a manufacturer to a market glutted through no action of his own but through the unrestricted sale of Government owned products. Such products, it was pointed out, should be sold abroad where they would assist our Allies in getting on their feet.

### Optimistic Over Labor Readjustment

Neither Secretary Redfield nor Charles M. Schwab expressed any apprehensions regarding labor during the present reconstruction period. Both believe that there will be no period of unemployment that our factories will absorb workers as quickly as they are released from mili-

## Detroit Automotive Conditions

### Unsettled as Regards Getting Back to Normal Production —Price Trend Doubtful

DETROIT, Dec. 3—Conditions here still are unsettled as regards the time when the motor car factories will get back onto a normal basis of production and also as to what prices are going to be. The time when normal production will be reached will depend upon the extent to which factories were on a 100 per cent war basis and upon the ease with which materials may be secured. Some of the factories were on a 100 per cent war basis, while others were working in that direction, with the expectation of being so by the first of the coming year. Manifestly, these latter companies, other things being equal, will be able to resume normal production sooner than will the former. The general impression prevails that it will be several months in coming.

No material changes in the price situation have taken place during the last week. Reductions, or rather a return to price conditions of early last fall, will be made by one or two concerns which are not, however, ready to make public announcement of their intentions just at this time. These contemplated reductions hardly will affect the situation seriously, it is believed.

The worst feature of the price situation, from the viewpoint of the concerns which have already announced that no changes are imminent, or which have no intention of making a change, is the psychological effect upon the dealers of the reductions already announced. It is feared that there will be engendered in the minds of the dealers as a class the expectation that prices in general will come down, with the effect of slowing up business for the next 90 days.

But that price reductions will be generally resorted to is regarded as highly improbable. Some of the larger concerns already have stated positively that no changes will be made, and as far as this goes it will have a counter effect on dealers and will tend to stabilize the situation.

There is no intimation of a downward tendency in prices on motor trucks. The truck manufacturers anticipate a big demand for trucks for industrial and farm purposes, and with labor and material conditions as they are they profess to regard lower prices as an impossibility. Indeed, some of the truck manufacturers

are inclined to take the other angle and assert that if any movement of prices is manifested it will be upward rather than downward.

### N. A. A. J. to Hold Convention

CHICAGO, Dec. 2—The National Association of Automobile Accessory Jobbers will hold a convention Dec. 16, 17 and 18 in this city. It had scheduled a convention and exhibit for about Nov. 1, but dropped its plans at the request of the War Industries Board.

The directors and committees will meet the 16th, which is Monday, and the general sessions will be held the 17th and 18th. The usual practice had been to hold the convention for an entire week, and such would have been the case had not the exhibit been discontinued.

## Detroit S. A. E. Sees Liberty Engine Manufacture

### Record Attendance Brought Out by Ford Reels and Lecture on Aerial Warfare

DETROIT, Nov. 30—The convention hall of the Pontchartrain Hotel was crowded to capacity last night to accommodate the great crowd which came to attend the third fall meeting of the Detroit Section, S. A. E. The program for the evening consisted of a moving picture portrayal of the manufacture of Liberty motors in the Ford plant, followed by an illustrated lecture on Aircraft Warfare by G. Douglas Wardrop, managing editor Aerial Age Weekly.

The Ford film was intensely interesting. The manufacture of Liberty motors was followed through from the raw materials to the finished aircraft. The wonderful machinery which is used in the manufacture of motors, the speed and precision of manufacture and the careful inspection of every process were depicted in full.

Mr. Wardrop's illustrated lecture was no less interesting. Recently returned from England and the Flanders front, where he had the privilege of investigating the use of aircraft in war activities, accompanied by the experience of being a companion in the flight of some of the noted airmen, the speaker was enabled to invest the story with what he said was a personal and intimate touch, which made his story stand out vividly. The pictures, too, with which the lecture was

## 1918 Car and Truck Production

### Passenger Cars Show Big Drop; Commercial Cars Have Increased

WASHINGTON, Dec. 2—Production of passenger cars and trucks, by quarters, for 1918 is as follows:

	Passenger Cars	Commercial Cars (Civilian only)
First quarter.....	293,333	45,500
Second quarter.....	345,100	45,417
Third quarter.....	186,173	45,429
*Fourth quarter.....	150,900	46,300
Total .....	974,606	182,646

\*Estimated.

In 1917 there were produced 1,718,000 passenger automobiles and 160,000 commercial motor vehicles, whereas under the war restrictions this year the total output of passenger cars will be slightly less than 1,000,000, or 740,000 fewer than in 1917. There was no enforced limitation of truck production until last August, except that many assemblers were unable to obtain deliveries of engines, transmissions and axles. Trucks produced and sold for civilian use only last year totalled 109,000, while this year they will reach 182,000—an increase of 67 per cent.

### Saxon Price Reduced

DETROIT, Dec. 4—The Saxon Motor Car Corp. has reduced the price of its 6-cylinder passenger car from \$1,295 to \$1,195, effective at once.

### Decreased Appropriation for Air Service

WASHINGTON, Dec. 2—Appropriations for the current year submitted to Congress by Secretary McAdoo to-day included \$144,943,000 for the Air Service as against \$760,000,000 last year.

illustrated, were of a nature to give the observers a better understanding of the important part aircraft had played in the great war than many had heretofore had an opportunity to gain. Particularly interesting were the illustrations of all the various types of aircraft machines at present in use.

The lecture concluded with some prophecies for the use of aircraft in times of peace which would have sounded wildly Utopian just a little while ago, but which appeared very probable in view of the marvelous advances which have been achieved under the stimulus of war.

## Coast to Coast Air Mail Route

New York - San Francisco Service Planned with Feeder Lines to All Important Cities

WASHINGTON, Nov. 29—The inauguration of an aerial mail service between New York and San Francisco with feeder lines to all the important cities between those points is certain to follow the signing of the peace terms.

The Post Office Department plans to ask appropriations of \$1,500,000 and possibly more for this work. In addition to the postal service the Navy plans to continue and develop mail service between its various stations and Naval hydroplanes may also be used by the Post Office for mail flights over water routes.

It is possible that one route will be established over the Mississippi River, connecting New Orleans, Memphis, St. Louis and St. Paul on the Mississippi River; St. Louis, Jefferson City, Kansas City and Omaha on the Missouri River, and Louisville and Cincinnati on the Ohio River. Another route will likely extend up the Hudson River valley, connecting New York City with Albany and other up-State points.

That there will be an extension of the Air Mail Service to include Denver was indicated in a telegram from Postmaster-General Burleson to Senator John F. Shafroth of Colorado, stating:
